FOREIGN QUARTERLY REVIEW,

No. XLV.

FOR APRIL, 1839.

- ART. I.—1. *Meteorological Sketches.* By an Observer, (W. C. Redfield, Esq. of New York). Prepared for the 13th edition of the American Coast Pilot. American Journal of Science, No. I. Vol. XXXIII.
2. *Mr. Redfield, in Reply to Mr. Espy, on the Whirlwind Character of certain Storms.* From the Journal of the Franklin Institute.

WE venture, with all respect to our readers, to offer ourselves as one of their aides-de-camp or professional friends in this inquiry—not so much, however, to save them the trouble of reference to the works in question, as to guide their investigations by directing their attention to the most important facts of the subject. We have seen a few gales of wind in our time; and though it has never fallen to our lot to encounter a real hurricane, we have often studied their history on those lands and seas over which they sweep with an irresistible fierceness, that seems to defy alike the skill of the engineer on shore, and the seaman afloat. We have always believed from the surprising uniformity in their action, that the laws which regulated their formidable movements would one day be brought to light; and that then the hurricane, like an enemy whose movements we have discovered, might be more successfully coped with.

Colonel Reid lays no claim to originality in this discovery of the Law of Storms,*

* An Attempt to develop the Law of Storms, by means of Facts, arranged according to Place and Time, and hence to point out a Cause for variable

which belongs, in part, to Franklin;—who clearly showed that gales of wind are progressive in a direction independent of that of the wind blowing in them;—in part to Colonel Capper, who suggested that they are vortices;—but essentially to Mr. Redfield of New York, who was the first person, Colonel Reid says, that gave any just notion of the nature of hurricanes. It is due to Mr. Redfield to mention that, until Colonel Reid informed him of Colonel Capper's having previously suggested the rotatory theory of storms, he was quite ignorant of the fact. This we can positively assert. Various other authorities have assisted more or less in this inquiry*—but it is not our present purpose to go into a history of the subject, still less to enter into the controversies to which it has given rise; but rather to lay before our readers with all impartiality the present state of our knowledge of the facts, so far as they seem to bear on the purposes of navigation. This we do, in the confident expectation that the attention of our

Winds, with a view to practical use in Navigation. By Lieut.-Col. Reid, of the Royal Engineers. London: Weale. 1835.

* Dove of Berlin, whose ingenious speculation—for it is no more—has the following remarkable passage in one of his papers: "Hence," says he, "I ascertained, that in this country at least (Prussia), all winds are great whirlwinds—(I have seen rotations of from one to twenty days): that the rotation within this whirl moves on an average always in the same direction." Dove's Outlines of a General Theory of the Winds, translated in the 67th and 68th Numbers of the L. & E. Ph. Mag. for September and October, 1837.

foreign readers, especially those who inhabit the shores of the Baltic, the western coast of Norway, the Mediterranean, and the Black Sea, may be induced to co-operate in this important investigation; by collecting such a series of facts as may tend either to establish the theory first practically developed by Mr. Redfield, and so ably generalized and all but demonstrated by Colonel Reid; or else to substitute some other in its place, no less available in the practice of navigation and seamanship.

It may not be unnecessary, before going further, to say a word or two in explanation of the two technical terms we have just used, and which to most persons, we suspect, convey but vague ideas of essential distinction; but which distinction it is very important to keep in view when we wish either to understand and relish these researches as a matter of scientific curiosity, or to apply our knowledge of the law of storms to practice at sea.

Navigation is the art of conducting a ship; first across the seas from port to port, by knowing the route which may be followed with the most advantage; and next, by ascertaining at any given moment in what part of that route the ship may be, or how far out of it she may have been carried by currents or winds, or the treacherous agency of magnetic deviation. Seamanship on the other hand, so far as it relates to the progress of the voyage, consists in knowing what sail the ship is capable of carrying; how she is to be steered in fine weather; at what angle with the wind and sea she is to be placed in tempests; and generally, how she is to be trained and trimmed that she may make the most way with a fair wind; lose least when it is adverse; be exposed to the smallest quantity of wear and tear, or more serious hazard, in bad weather; and finally, that she may be placed, when the circumstances again become favourable, in such a position as to prosecute the voyage with advantage.

For want of these two kinds of knowledge many a goodly ship has gone to the bottom—many a voyage has been baulked altogether—while innumerable others have been protracted to twice or thrice their proper duration, to the serious loss of the owners, the health of the crew, and often to the ruin of the ship, by the needless straining to which she has been exposed.

It is very true that old sailors, especially if their business leads them to traverse again and again the same districts of the ocean, do acquire an instinctive sense of the right thing to do, even under the fiery trial of a hurricane; but by far the greater number

of sailors, however experienced, have hitherto been left very much at a loss on these occasions. Of the truth of this an inspection of the numerous log-books brought together by the industry of Colonel Reid will afford ample proof. Nor is the remark confined to the merchant service, but includes in many cases the most highly educated and experienced officers in the navy. It is easy to perceive indeed, that talents, and the longer or shorter exercise of those habits of resource which the naval profession above all others has a tendency to teach, make a vast difference in the manner in which different ships are handled under similar circumstances of danger and difficulty. But nothing is more certain, as every observant officer must have felt, than the practical advantage which results from an acquaintance with the theory of the phenomena they have to deal with; since it enables them to form a business-like generalization of the laws of the winds, currents, and so forth, which they must meet in traversing the ocean.

Of all the difficulties that seamen have to encounter there is perhaps none which has more frequently baffled their skill or perplexed their science, than the hurricanes of the West Indies and the coast of America, and those of the Mauritius. As it happens also unfortunately, that these districts form parts of the most frequented routes of the ships of all nations, not a season passes in which we do not hear of vast losses of life and property, both on board ships and on shore. So that it becomes a question of great practical importance to ascertain the laws by which these furious tempests are governed; for until this be done it is but vain to hope that they can be successfully coped with. Indeed we may easily discover from inspecting the log-books in Colonel Reid's volume, that in many instances ships have been led into destruction by some of the ablest and most experienced hands, from their acting quite in the dark as to the movements of the elements around them; while, had they been in possession of the facts here recorded and of the generalizations based upon them, they might have saved their vessels.

It must not be supposed, however, that the law of these great storms is as yet fully determined; on the contrary, the chief object of Mr. Redfield's publications, and of Colonel Reid's, is to show the incomplete state of our knowledge of the facts upon which alone any safe and practical theory can be built. These gentlemen have, with great industry and public spirit, devoted themselves to the collection and arrangement of an immense mass of details; and their inferences from

these facts are drawn with so much ingenuity, that we are sure the science of navigation will immediately feel the benefit of the dispersion of Colonel Reid's book. This we rejoice to hear has met with the encouragement of the Admiralty, the Trinity House, and various other influential public boards, and has been sent, officially, to the Governors of all our Colonies.

We are most anxious to contribute our share in this important research, which is not merely national but universal; and of high interest to every country possessing either ships, colonies, or commerce. An inspection of Colonel Reid's work, in which is condensed and arranged all that is known up to this moment, will show the value of accumulating new facts; observed, not for the purpose of substantiating this or that hypothesis, but with a view to elucidating the actual laws that govern the winds; and they, we may be well assured, are as precise and uniform as those which regulate the other phenomena of nature. With the help of the rotatory and progressive theory which we shall presently explain, it is clear that observations may be made with much greater advantage than heretofore, even should that theory not turn out to be the correct one. Observers will now be taught how, and what, to note and to record; and we anxiously hope that the diffusion of this notice of the subject, on the continent as well as in this country, will essentially contribute to the establishment of such a series of general rules as may be available by practical men in all climates. This result can be accomplished only by the collection of a great mass of actual observations, patiently examined and reasoned upon, at full leisure, in the closet of such men as Redfield and Reid; to be afterwards made use of by seamen in their times of greatest danger and difficulty.

We have already mentioned that the nature of a hurricane, and probably of all great storms, was first suggested, as we believe, by Colonel Capper, who says—

"It would not, perhaps, be a matter of great difficulty to ascertain the situation of a ship in a whirlwind, by observing the strength and changes of the wind. If the changes are sudden and the wind violent, in all probability the ship must be near the centre of the vortex of the whirlwind; whereas if the wind blows a great length of time from the same point, and the changes are gradual, it may reasonably be supposed the ship is near the extremity of it."

This hint has been at last acted on and followed out with great success by Mr. Redfield, who, from living in the United States, had the best means of studying those great

hurricanes that, after exerting their worst violence among the west islands, visit the shores of the United States, along which they often sweep with great force. This able philosopher has accordingly availed himself of his position with singular address, and Colonel Reid is not slow to acknowledge the extent of his obligations to his trans-atlantic fellow-labourer.

Franklin, as we have said, was aware that what he called north-east storms,—or those storms in which the wind blew from the north-east point of the compass, came in reality from the south-west; that is to say, they were first felt in those parts of the country which lay to the southward and westward of his position—beginning in Florida, then striking the state of Georgia, and so on to the Carolinas, Virginia, New Jersey, New York, Connecticut, and finally Massachusetts, which state contains Boston. Now as this town, where Franklin resided, lies at the weathermost point of the tract of these gales, it became an interesting question to determine how they came from the leeward: but his explanation, though ingenious, is certainly not near so satisfactory as the present theory. Franklin's idea was, that from some cause a partial vacuum was formed in the south-west, near the point where the gale was first felt, and the adjacent winds rushing in to supply the vacant space, caused the north-eastern gale; farther, that as the place of this air was also to be supplied, another and another portion was called into action, beginning from the south-west and proceeding to the north-east.* The doctrine held by Mr. Redfield, and we think substantiated by the facts brought together by him and by Colonel Reid is, that a hurricane or great gale is simply a whirlwind, revolving (at least in the northern hemisphere) in a direction contrary to that of the hands of a watch; or from right to left, supposing yourself in its centre; and that, at the same time, the centre of this vortex is advancing in a line at one time nearly straight, and at another considerably curved, but always at a rate of progression which is very slow compared to that of the wind circulating round this centre.

It will greatly assist the reader of Colonel Reid's book to construct a figure like the

* Franklin's words are, "Thus to produce a north-east storm, suppose some great rarefaction of the air in or near the gulph of Mexico, the air rising thence has its place supplied by the next more northern, cooler, and therefore denser and heavier air; a successive current is formed, to which our coast and inland mountains give a north-east direction." This theory falls to pieces under a very slight examination of Mr. Redfield's facts collected in the United States.

following, of concentric circles on a card, and hold it in his hand or lay it on the maps at the end of the book. We know indeed by experience that it is not easy to follow the Colonel's explanations without the help of such a guide, but that by its means the whole is perfectly simplified.

N. B. The letters and the arrows show the direction from which the wind is blowing.

An inspection of this figure will show that if such be a representation of the manner in which the wind revolves round a centre, which we have ample reason to suppose that it does in the northern hemisphere, the following circumstances may be expected. On the northern part of all the circles, great and little, the wind will be found to blow from the east, while on the south parts of the same circles it will be blowing from the west: on the right or eastern hand the wind will be from the south, and on the left or western side from the north. At the intermediate points the wind will be found to vary between these points. Thus half way between the eastern and northern sides of the circles the wind will be found to blow from the south-east, and so on.

It may be proper to mention that, so far as authentic observations have yet been compared together, this rotatory law (that is, from right to left, or contrary to the motion of the hands of a watch) belongs to all hurricanes and other great storms in the *northern* hemisphere; while similar observations tend to show that the storms of the *southern* hemisphere revolve in the opposite direction. In order to avoid confusion, however, we shall confine ourselves to the storms on the northern side of the equator; and this being borne in mind, we shall proceed to explain by means of a diagram, what would take place if a rotatory storm, advancing in a north-western direction, were to strike four ships differently situated.

The wind would not veer much, as Colonel Reid remarks, while the hurricane was passing over A, the ship which lay most to the eastward. It would commence with her at about east by south and leave off at south by east. The next ship, B, would be plunged deeper into the hurricane. With her the gale would commence at east by north, then it would veer to east, next to south-east, then to south, and on leaving her it would blow from south by west. The ship C, which is supposed to be placed directly in the path of the hurricane's centre, would get the gale at north-east; and this direction would be continued without any variation, but probably with unceasing violence till the centre of the hurricane had nearly reached her, when she would experience a short calm; after this the wind would blow again with great violence from the opposite, or south-western quarter, without variation in direction but probably with gradually diminishing violence, till it left her altogether. The fourth ship, D, would get the gale first at north-east by north, then north north-east, next north by east, then north, north by west, and north-west in succession; after which it would veer to west north-west, west, west south-west, and lastly to about south-west by west on quitting the gale.

With this example steadily kept in the mind, and a card of the description we have recommended at p. 4. always ready to lay on the maps as the reader prefers them, or to hold in his hand while consulting the log-books from which Colonel Reid gives the most copious extracts, we are convinced that the whole of the documentary part of the work may be understood, and the proper degree of weight be given to the evidence brought forward. It must be recollected that when the question regards phenomena in the southern hemisphere, the rotatory motion of storms is in the direction of the hands of a watch, or from left to right. We fear it would be altogether hopeless to give any just notion of the degree of conviction with which the evidence of Colonel Reid's witnesses impresses our minds, unless we could give not merely the words of their testimony, but also (which is quite out our power) the beautifully executed and satisfactory charts, by which not only the work is embellished, but the whole argument illustrated in the clearest manner. We may describe, however, what is the nature of this evidence. It consists of a great number of records, simultaneously but independently made, of the direction of the wind and the state of the weather, at a great variety of places, during the period that a storm has been sweep-

ing over given districts, whether at sea or on land, or both. It will be evident from these data that, if the rotatory theory be true, and instead of one gale uniform in direction sweeping over the district in question, a whirlwind more or less limited in diameter be carried along a given course, that then the winds adjacent to that course will vary in succession through every point of the compass.

At first sight this might appear merely a matter of scientific curiosity; but it is to be considered that if the captain of a ship be informed of the exact part of the storm in which he is involved, and be in possession of the laws which regulate its direction and its degrees of violence, he may be able to shape such a course as either to escape from the vortex altogether, or to separate himself as far as he can from those divisions of it where the wind blows with the greatest force. Even supposing, which is but a common case, that the fury of the storm is too great to admit of any sail being carried at all, or any headway being made, still it may in most instances be in the power of the commander to place his ship on the tack he pleases; and this alone, under certain circumstances, may often be the means of saving a ship from foundering.

We are not afraid of being found too technical to be understood when we say that if a ship is lying to, even under bare poles, it is of considerable consequence to her safety to know whether the wind is likely to veer forward or to veer aft. If it veer or shift aft, that is, come more and more fair, or towards the stern, the ship "comes up" as it is called, and no greater harm is done than her plunging into the head sea which the previous wind had knocked up. But if the wind shifts forward, or in sea language "breaks her off," she is apt, if the shift of wind is sudden, to be taken aback, and in certain cases is forced stern foremost amongst the waves, and so sent to the bottom before means can be taken to "pay her off."

This, we think, will be quite enough to show the great importance to seamen of their being made aware of the "Law of Storms;" and we consider that the naval profession, military as well as mercantile, all over the world, are in the highest degree indebted to Colonel Reid for having gone into this branch of the subject with a technical precision, truly remarkable in a person not bred to the sea, and a clearness which no one at all interested in the subject, and on the spot where the danger arises, can possibly mistake.

Colonel Reid winds up his book by a notice, entitled "Rule for laying ships to in a

hurricane;" and since, practically speaking, this is perhaps the most important point of the whole discussion, we shall give his directions in his own words, which no seaman could improve.

"That tack," says the Colonel, "in which a ship should be laid to in a hurricane has been hitherto a problem to be solved; and is one which seamen have long considered important to have explained. In these tempests, when a vessel is lying to, and the wind veers by the ship's head, she is in danger of getting stern way, even when no sail is set; for in a hurricane, the wind's force on the masts and yards alone will produce this effect, should the wind veer ahead; and it is supposed that vessels have often foundered from this cause. When the wind veers aft,

as it is called, or by the stern, this danger is avoided; and a ship then *comes up* to the wind, instead of having to *break off* from it.

"If great storms obey fixed laws, and the explanation given of them in this work be the true one, then the rule for laying a ship to, follows like the corollary to a problem already solved.

"In order to define the two sides of a storm, that side will here be called 'the right hand semicircle' which is on the right of the storm's course, as we look in the direction in which it is moving; just as we speak of the right bank of a river.

"The rule for laying a ship to will be, when in the *right hand* semicircle, to heave-to on the *starboard* tack, and when in the *left hand* semicircle, on the *larboard* tack, in both hemispheres.

"This figure is intended to represent one of the West India hurricanes moving towards the north-west by north, in the direction of the spear drawn obliquely. The commander of a ship can ascertain what part of a circular storm he is falling into, by observing how the wind begins to veer. Thus in the preceding figure, the ship which falls into the right hand semicircle would receive the wind at first about east by north, but it would soon veer to east, as the storm passed onwards. The ship which falls into the left hand semicircle, would at first receive the wind at north-east, but with this latter ship, instead of veering towards the east, it would veer towards the north."—p. 425.

The Colonel might have added in further illustration of the practical use of these laws

that, supposing either of the ships in the above figure to have had it in their power to carry sail, instead of lying to, the one might have steered to the north-east, and the other to the south-west, and thus have got beyond the limits of the hurricane before they came abreast of the centre; and here all authorities seem agreed in placing the most violent gusts, and the most sudden and dangerous shifts of wind.

It is not very easy at first to understand how the above rule, laid down by Col. Reid for lying to, will apply to the hurricanes of the southern hemisphere which are known to devolve in the opposite direction. But this will be obvious by considering the following figure.

"In both these figures the black ships are on the proper tacks, the white, or unshaded ships, being on the wrong ones.

"The second figure is intended to represent one of those hurricanes in south latitude which pass near Mauritius, proceeding to the south-eastward. The whirlwind is supposed to be passing over the vessels in the direction of the spear head. It will be seen that the black ships are always *coming up*, and the white ships always *breaking off*; and that they are on opposite tacks on opposite sides of the circle.

"Thus the *Astrea*, commanded by Sir C. Schomberg, was on the proper tack on the 20th March, 1811, and an inspection of the log of that ship at p. 236, will show how gradually she came up; but the *Buccleugh* on the 22d January, 1834, (pp. 152 and 153, and the figure on p. 151,) having had the wind from E. S. E. veering to south then to south south-west, thereby proving her to be on the right hand semicircle of a storm moving southerly, was in the wrong position when laid to on the larboard tack. Had she been on the other tack, the wind veering would have drawn aft; then, perhaps, she would not have been so long with her broadside in the trough of the sea, and with her lee waist full of water."—p. 428.

We make no apology for dwelling chiefly on these practical points, for we feel above all things anxious to show that such inquiries are really useful to seamen, and are not merely ingenious speculations. Our wish is to encourage observers on shore as well as afloat to take notice of the facts, and to record them carefully, under the impression that their labour will be usefully bestowed in rendering navigation more certain and more safe; and we would solicit the attention of navigators to these investigations from a conviction of the truth of what Colonel Reid so often urges; namely, that if the wind in storms follows a fixed law, much

advantage must be immediately gained by the knowledge of that law.

We have already pointed out some of the advantages of knowing these laws, but we may advert to others. Colonel Reid shows that, in several cases, ships by not knowing what they were about, or rather by not knowing what the winds were about, actually kept company with hurricanes, as if such companionship were a thing to be sought!

"In following," says he, "the tracks of storms here detailed, we find that the hurricane drawn on chart vi. passed over the island of Antigua in six hours; yet the ship *Judith-and-Esther* not far from that island, was twenty-four hours in that storm, for she ran along it; and many other instances of the same nature occur in this inquiry."—p. 429.

If the reader will refer to the account of the fatal gale well known in the Indian seas by the name of the *Blenheim's Storm*, in which that ship and the *Java* foundered, he will see at pages 241 and 243, that the *Harrier* brig scudded, that is put herself right before the wind throughout the whole gale, changing her course as the wind veered. Thus she necessarily kept in the hurricane, running round and round one of its circles, for three quarters of a revolution! It is possible, nay, almost certain, that had she been aware of the laws which regulate storms, she might readily have flanked out of it. It is not, however, in the guidance of ships in storms alone that these laws, if they are well founded, may be rendered available in the practice of navigation; for they are highly serviceable in such weather as may be taken advantage of to advance the voyage. A hurricane at sea is like a battle in a campaign; an important but an unfrequent occurrence, for which it is wise to be well prepared. But the general business of a voy-

age like that of a campaign, is to get along ; and it is of as great importance to a navigator to know where to look for a wind, as to know how to profit by it when he has found it. On a voyage to or from India, a skilful sailor, especially if he adds some touch of science to the rule-of-thumb knowledge he has derived from experience, will be able "to pick up a wind" during almost the whole of his track out and home. Let us hear what Colonel Reid says on this subject.

"If one side of a storm be to a ship in her voyage a foul wind, the opposite side of the same storm would be a fair one. Thus within the tropics in the Indian Ocean, the left hand semicircle is a fair wind for ships in their voyage from India to the Cape of Good Hope, whilst the right hand side will assist the voyages of outward-bound ships. But," adds the Colonel with his usual technical precision, "there is this important difference, that in the case of the ships coming from India to the Cape they would carry the fair wind with them ; whereas in the other semicircle, owing to the ships' sailing in the contrary direction to the progression of the gale, they would have the benefit of it during a short time only. Thus if a hurricane coming from the eastward were passing over the Mauritius, moving at the rate of ten miles an hour, and a ship sailing eastward were to fall into the side of the storm next the equator, (she would find the wind fair and blowing from the westward, but) the ship and storm would pass each other in half the time in which the hurricane would pass over the island since they would be travelling at the same rates, but in opposite directions."—p. 429.

He might have completed this illustration by saying, that if a ship coming from Ceylon or Java were to fall in with the storm at its southern border, or that farthest from the equator, she would have a fair wind from the eastward ; and if it were not too violent, she might scud before it so as to "improve the gale" during the whole range of its progression.

We have already mentioned that, without referring to the charts in Mr. Redfield's papers and Colonel Reid's book, and giving much more copious extracts from the log-books of the ships whose places are laid down on the charts than we have space for, we could afford no fair notion of the kind and degree of evidence which is brought forward in support of the rotatory and progressive motion of storms. There is one case, however, which is more susceptible of description in words than the rest, and we shall mention it as an interesting sample of the theory.

Before proceeding to this particular case (that of the *Blanche* frigate), it is but fair to such of our readers as have not seen Colonel Reid's book, or fallen in with Mr. Redfield's

papers in the *American Journals of Science*, to state in general terms that in the months of August and September, which is the well known hurricane-season of the West Indies, these furious tempests are found to begin somewhere between the latitudes of 10° and 20° north, and the longitudes of 55° and 60° west, in that district of the Atlantic lying immediately to the eastward of Barbadoes. The hurricanes would seem to be much more limited in their size at first than they become afterwards ; as is evidenced by their sometimes threading their way, as it were, amongst the windward islands, desolating some and leaving others unharmed and in a state of calm ; or if at sea, dismasting some ships of a fleet, while others at no great distance enjoy moderate breezes ! The hurricane then proceeds on its course towards the west-north-west, and after visiting in succession Barbadoes, Martinique, Gandaloupe, and the other islands of that cluster, falls upon Porto Rico, St. Domingo, Jamaica, and Cuba. Hereabouts it generally begins to bend its course more towards the north. In military language the hurricane here obeys the order "left shoulders forward !" or as sailors would say, "puts its helm a-port," making furious havoc at Turk's Island, and at Rum Key, and others of the Bahamas, a region especially exposed to the fury of these tempests. After this the gale, now greatly expanded in width, shapes a course nearly north ; which, however, it continues but a short time before it re-curves, or bends back into a north-eastern route ; and this it maintains along the shores of the United States till it passes New York, the Eastern States, and Nova Scotia, and is finally dissipated about the region of the Banks of Newfoundland.

During this long march of about three thousand miles the hurricane advances at a very slow rate, say from ten to twenty miles an hour only ; or not more, and frequently not so much as, the ordinary velocity of the trade winds ! When it is considered that the velocity of the wind *in* the hurricane itself often amounts to 80, 90, or 100 miles an hour, it is difficult if not impossible to account for the well known facts of the case upon any other supposition than that they are merely progressive whirlwinds.

We shall now glance at the curious case of the *Blanche* frigate, Commodore Farquhar, which was off the north side of Cuba on the 12th of August, 1830. On the 15th she passed through the straits of Florida under the full influence of the gulf stream, which carried her rapidly to the northward. Here she was overtaken by a hurricane, which, having passed a little to the northward of Barbadoes three days before, must have trav-

elled at the rate of about seventeen miles an hour in a direction about north-west-by-west. The left or north-western side of the whirlwind appears to have struck the *Blanche* in the middle of the night, for the wind blew from the north-east. She was then on the starboard tack, but as the wind veered to the northward she fortunately wore ship about sunrise; and placed herself on the larboard, or proper tack for a ship in the left hand semicircle of the storm.

There she lay, plunging at a great rate, losing her topmasts and other spars piecemeal, springing her lower masts, splitting her sails, and having men washed overboard; in short, exposed to all the fury of the hurricane. Meanwhile the storm having reached nearly its extreme western point, had recurved, and was proceeding slowly on its course to the north-north-west; and thus the *Blanche* (being in the left half of the whirlwind) had the wind blowing successively from the north-east, north, north-west, and, finally, west and south-west, till at last the storm passed on and left her altogether. By dint of the south-west wind in the tail of the hurricane, and the favourable agency of the gulf stream, she made rapid progress to the north-eastward. On the 22d of August, however, she was overtaken by a fresh hurricane, which came from the southward, after having swept past the Bahamas as usual. On this occasion, however, the *Blanche* passed through the right hand semicircle of the storm, which is manifest from her having the wind first from the east-north-east, then the east, veering so quickly to the south-east and south, as to indicate a near approximation to the centre of the whirlwind. And here, one of many apparently minute, but really important details is obtained by an inspection of the actual log-book. We allude to the circumstance of the foresail being set just at the time the wind had shifted from south-east to south; and when, had the commander been aware of the true theory of storms, he might have suspected that the lull in which he made sail as if the storm had passed, was only indicative of his being close to the central, or most dangerous district of the hurricane. Accordingly, on reading a little farther, we find that a heavy sea presently stove in the cabin deadlights; the reefed foresail was again hauled up, the hurricane increased, and the forestay sail blew to pieces.

On this occasion, too, the *Blanche* was on the starboard, or proper tack; so that as the wind shifted from south-east to south, and so to south-west and west, she always "came up" as the wind hauled round. What is highly curious in itself, and important in confirmation of the rotatory theory in storms,

is the fact, that while the *Blanche*, at the distance of between three and four hundred miles from the coast of America, had the wind blowing from the south-east, veering to south west and west, it was "every where a north-east storm along the whole range of the United States."—Reid, p. 121. This clearly indicates that the centre of the whirlwind passed along at some distance from the shore, in a direction so nearly parallel to it, that only the north-western, or left hand division of the circle swept the different parts of the coast in succession; so that while to the inhabitants of the "seaboard" of the United States this gale seemed merely a north-eastern storm, it veered all round the compass to the *Blanche* and various other ships at some distance from the coast. For example, the *Britannia* sailed from New York on the 16th of August, and met the hurricane on the 17th, when the wind was north-east, but it presently shifted to the east-north-east, and then to south-east. In like manner the ship *Illinois* was overtaken on her way from New Orleans to Liverpool by this same hurricane.

"It will be seen," says Colonel Reid, "that on the 15th of August, 1830, the swell caused by this storm, then to the southward of this ship, reached the vessel; but as the *Illinois* had a fair wind and was assisted by the gulf stream, whilst the storm made a detour towards Charleston and the coast of Georgia, she, for a day, outran the swell; but on the 17th the storm overtook her, blowing furiously from south, whilst at the same moment the wind from the north-east was unroofing the houses at New York!"—p. 14.

This rotatory and progressive theory is greatly strengthened by observing what takes place when the centre of the storm, instead of passing at a distance from the coast, falls near it, or actually upon it. In this case, the inhabitants of the "seaboard" towns experience exactly the same shifts of winds, or veerings, as a ship does, which, like the *Blanche*, is plunged into the heart of the hurricane. The industrious, clear-sighted Redfield has accumulated a number of most interesting facts respecting the second storm of August, 1830, and as these have very properly been reprinted by Colonel Reid, (pages 18, 19, and 20,) any one who pleases may trace its progress along the whole coast.

We shall conclude this branch of the subject by extracting Mr. Redfield's summary of the dimensions, the rate of progression, and the course followed by this remarkable storm, which he says "appears to have passed over the whole route comprised in the foregoing sketch in about six days, or at an average rate of about seventeen geographical miles per hour."

"The duration of the most violent portion of the storm, at the several points over which it passed may be stated at from seven to twelve hours.

"The general width of the tract influenced in a greater or less degree by the gale on the American coast, is estimated to have been from five to six hundred miles. The width of the *hurricane portion* of the track, or severe part of the gale, one hundred and fifty, to two hundred and fifty miles. Semidiameter of the hurricane portion of the storm, seventy-five to one hundred and twenty-five miles.

"The rate of the storm's progress from the Island of St. Thomas to Providence Island, Bahamas, (nearly the whole range of the West Indies) fifteen nautical miles an hour. From Providence to St. John's in Florida, sixteen miles per hour. From St. John's to Cape Hatteras, North Carolina, sixteen and a half miles per hour. From Cape Hatteras to Nantucket, on the south-eastern coast of Massachusetts, eighteen miles per hour. From Nantucket to Sable Island, off the south-eastern coast of Nova Scotia, twenty miles per hour."—*Reid, p. 20, cited from Redfield.*

Our space, we regret to say, will not allow us to follow in detail, or indeed at all, any of those memorable West India hurricanes of which Colonel Reid has collected together the accounts; and these he has illustrated by woodcuts and maps of great beauty and interest, and substantiated by such a mass of evidence from the log-books of the ships, the meteorological journals and newspapers of the islands, and the official reports of the various authorities, as sets the question almost at rest. At all events we feel confident, now there is such a key put into the hands of the persons who have most interest in the decision, we mean the inhabitants of the hurricane latitudes, as they are called, and seamen navigating the circumjacent seas, that the point at issue must soon be determined. In the meantime we can safely recommend this portion of Colonel Reid's book to the perusal of the general reader, as likely to afford him—we cannot say amusement—for such formidable scenes are too painful for that—but the highest degree of interest which any such voyages or travels can be supposed to yield.

Besides the more recent hurricanes, five of which he traces in one year, (1837,) Colonel Reid gives a minute and instructive account of the great storm of 1780, when, of Sir Peter Parker's squadron, the Thunderer, the Stirling Castle, Scarborough, Barbadoes, Phoenix, Deal Castle, Victor, and the Endeavour, were all lost, and nearly the whole of their crews perished! The Berwick, Hector, Trident, Ruby, Bristol, Ulysses, and Pomona, were dismantled. Of Sir George

Rodney's squadron, the Blanche, Andromeda, Laurel, Chamelion, and Beaver's prize were lost; and the Vengeance, Montagu, Ajax, Alcmena, Egmont, Endymion, Albemarle, Venus, and Amazon, were dismantled or severely damaged.—p. 275.

In like manner he describes, in more or less detail, the storms of the southern hemisphere; especially those which blow with such irresistible fury at and in the neighbourhood of the Isle of France. The most remarkable of these is known by the name of the "Culloden's Storm;" and from the circumstance of its details having been fully examined into and reported upon by a court of inquiry composed of twelve East India Directors, much light is thrown upon the subject, all tending to establish the rotatory and progressive theory.

We have not space to go into this inquiry; but as it is important to fix attention upon the uniformity in principle between the phenomena of the two hemispheres, we shall quote one paragraph from Colonel Reid's book. Alluding to the Culloden's storm, he says—

"So many ships dispersed by the same storm over a great extent, give us the means of judging of its nature and of the course it took. We find it, after having travelled obliquely with regard to the Trade-wind from the east towards the west, recurving at the 25th and 30th degrees of south latitude, and going off to the *south-eastward*, with a remarkable degree of similarity to the manner in which hurricanes already traced in the northern hemisphere, pass off to the north-eastward."—p. 159.

This singular recurving or bending of the track of these hurricanes, both in the northern and in the southern hemisphere, can be fully understood only from inspection of the maps laid down by Mr. Redfield and Colonel Reid in illustration of their positions. These projections also explain some anomalies which puzzled and misled even the oldest sailors, but which by their help are not only simple, but such as may be turned to account in the practice of navigation.

In the minutes of the proceedings of the committee of inquiry at the India House, most of the commanders speak of this hurricane (the Culloden's gale) as two distinct storms; and throughout their evidence, use the terms first and second gales. This appeared an enigma, until chart VIII. was projected by Colonel Reid—but when the chart was finished, this very circumstance helped to explain the nature of the storm. And further on it is shown almost to demonstration how four of the Indiamen, by not knowing what they were doing, and in entire

ignorance of the laws now developed, must have sailed towards the tract of the storm's centre, "near which, in all probability, they foundered."—p. 160.

"The storm in which H. M. ships Blenheim and Java foundered," says Colonel Reid, "bears the same indication of a rotatory character with those already described."—p. 240.

In short, without multiplying examples, it may be said that in both hemispheres every well authenticated fact or rather set of facts (for it requires a good many simultaneous observations to prevent error,) tends to confirm the rotatory theory.

This brings us to a highly interesting branch of the subject; namely—How do storms behave in high latitudes? and we venture to say that no one who examines Colonel Reid's ninth chapter which answers this inquiry, will fail to discover in it matter of the highest interest, and all the more so from its bringing the subject to our very doors.

"On the south coast of England, violent gales usually set in with the wind about south and veer *by the west*, towards north-west. The barometer falling at the commencement, rises as the wind becomes more northerly. In the corresponding latitude, in the southern hemisphere, this order as regards both wind and barometer is reversed."—p. 369.

Colonel Reid goes on to illustrate his generalization by an attempt, and we think a successful one, to ascertain the nature of the gales of February, 1838, particularly a storm which was severe from the south-east quarter in Ireland, and at the west of Scotland. The scope afforded by Great Britain however being rather too limited for this inquiry, Colonel Reid obtained information from Rear Admiral Sir John Ommaney, commanding on the Lisbon station.

"By the reports from the ships under his command, we find that on the 14th February, when the storm was blowing violently at Cape Clear Light House (on the south of Ireland) from the *south-east*, that the Chamelion was lying-to in a hard gale off Oporto, with the wind at *south-west*. On the 12th February, too, the Bellerophon was driven on shore at Gibraltar, with the wind at *south-west*."—p. 377.

Now we find by the published records (p. 381) that the wind in Ireland at the same moment was from the north-east. It was only wanting, to substantiate the rotatory nature of this gale, to ascertain in what direction the wind was blowing at the bottom of the Bay of Biscay; and we may imagine the satisfaction with which Colonel Reid

ascertained (after his book was published) from an inspection of the log-book of the North Star, Lord John Hay's ship, that the wind at Passages was blowing from the south at the same period that it was blowing from the north-east in Ireland, and from south-west at Cadiz and Gibraltar. Incidentally too he ascertained that the Athol, troop ship, far out in the Atlantic, (in lat. 27° N. long. 36° W.) beyond the Azores and Madeira, had light variable winds on the 12th and 13th February, when it was blowing so hard on the coast of Spain and in the Bay of Biscay. What is still more to the purpose, as she sailed on to the north-eastward the wind freshened and came from the west north-west and north-west; evidently showing that the Athol, by steering to the north-eastward, had overtaken the south-western portion of the whirlwind.

Our chief anxiety, throughout these remarks, has been rather to direct the attention of practical men to the most effectual method of meeting gales of wind with advantage to their voyage and safety to their ships, than to indulge in speculations on the most abstract principle of storms. But we are strongly of opinion that the two inquiries—theoretical and practical—may be most advantageously studied together.

One practical remark of great and immediate utility must not be omitted; and we have no doubt that its importance will be felt by all, but especially by persons in command of ships, on whom so heavy a responsibility rests.

An attentive consideration of the circumstances above stated will show that ships may safely, indeed advantageously, leave the American ports for Europe when half the storm is over; that is, when the wind begins to veer to the westward, for then the wind is fair for Europe. But when ships are about to sail *from Europe to America* the contrary will be the case; and ships starting from European ports should be very cautious how they put to sea when the wind suddenly changes to the south-east, with gusts and squalls, accompanied by a falling barometer;—for these combined symptoms indicate a coming storm. If the ships then put to sea with a fair wind at east or south-east, that is, during the first half of the storm, they will find the wind veer upon them to the south, south-west, and west, in the latter half of the storm. Thus they may encounter foul winds and bad weather while still entangled amongst the narrow seas and channels of the British islands. We believe that a neglect of these precautions is one of the principal causes of the many disastrous losses by shipwreck on the southern and western

coasts of England and Ireland. The great gale of Sunday night, the 6th of January, 1839, when so many ships were lost at Liverpool, is a remarkable case in point.

We may mention a very curious and important circumstance which occurred during the furious gale of the 29th October, 1838. The Royal Adelaide and Leith steamers were both off Flamborough Head on the morning of Monday the 29th, when the storm was raging. One of these vessels, as it appears, steered to the north north-east and continued in the gale for ten hours, while the other, by steering to the southward, remained in it only three hours. Now, we know from the facts collected in the Nautical Magazine for February 1839, that the progress of this storm was to the north north-east, which satisfactorily explains the above facts.

There is one point in practice of which every narrative in these books shows the importance, and to which we are most desirous of drawing the attention, not only of nautical men, but of the owners and underwriters of ships also. We allude to the indications of the marine barometer; an instrument absolutely invaluable, because it gives warning of physical changes in the atmosphere. These when taken in conjunction with other meteorological circumstances may almost always be turned to useful account; either in avoiding a gale, or in preparing for it, or in running out of it, or by making or shortening sail in due time. So strongly are we impressed with the primary importance of this instrument that we should earnestly counsel underwriters to require that every ship insured by them be provided with one.

Colonel Reid with his usual anxiety to give every one his due share of credit states, that we are indebted also to Mr. Redfield for the true explanation of the rise and fall of the barometer. And certainly we have nowhere seen the probable effect on the barometric column, exposed to the action of a whirlwind (which we may now fairly suppose all great storms to be,) so clearly pointed out as in Mr. Redfield's Reply to Mr. Espy, and in his Meteorological Sketches. He there shows that the atmospheric pressure must be at the least in the centre of such a vortex, and that it must increase as the outward limits are reached. He even supposes that the barometer may stand higher than its ordinary level, and not beyond the verge of a storm; and he has communicated to Colonel Reid (p. 418) that when the great hurricane of the middle of August, 1837, was passing, he observed the barometer at New York considerably above thirty inches!

"I would explain," says Colonel Reid, "the fall and rise of the barometer, by

taking a tumbler three-quarters full of water, and then making the fluid whirl round by a tea-spoon. Then hold the glass to the light, and the surface of the liquid will be seen in the form of a cone reversed. Sections across this cone will indicate the fall and rise of the mercury in the barometer."

We have only further to add on this part of the topic, that the indications of the barometer in the southern hemisphere are just the reverse of those in the north, and in all cases strictly in accordance with the rotatory theory. The extracts given by Colonel Reid from Captain King's sailing directions for Tierra del Fuego, p. 369 to 372, show this important fact.

Colonel Reid says in his book, that throughout his investigation into storms he has been desirous of avoiding mere hypothesis: and we think he has done wisely to employ his principal strength in collecting and arranging facts from every quarter, in order to form a substantial basis for those generalizations of which every page of his book shows the practical importance. But he has also favoured us with many valuable hints, both theoretical and practical, which we recommend not only to the attention of scientific men on shore and afloat, but to navigators in every part of the world.

Now, too, that our attention has been awakened, and that we have satisfactory evidence that *some* storms are rotatory and progressive, it is fair to infer that all or very many others may be so also; nor would it be difficult to bring this to the test of experiment in the case of ordinary squalls. Suppose, for example, that three ships were in company and sailing south, on the starboard tack, with the wind at west, and that a squall was seen coming down on their weather-beam. If the centre of the three were to lie-to in such a position as to bring the centre of the squall just upon her, while the headmost ship stood on so as to place herself abreast of the *southern* quarter of the squall, and the sternmost ship by tacking got in a line *with its northern* side, the rotatory character of the squall, if such exist, might be ascertained at once by actual observation. If its laws are the same as those of hurricanes and other great storms, and the experiment were tried in the northern hemisphere, the middle ship, or that which lay-to in order to receive the squall full upon her, would be taken aback by the wind at south; this would not change in its direction till the centre of the squall passed over her, when the wind would shift suddenly to the north, and continue so till it had left her again in the general current of the atmosphere blow-

ing from west. The headmost ship would get the wind first from south-west, which, unless she was "boxed off" briskly, might bring her about; then it would draw to west, and so to north-west, till it left her. The sternmost ship, or that which tacked to the northward, would get the wind first from the south-east, then east, then north-east.

There is one point respecting squalls which we have observed so frequently that we think we may call it general, namely, their slow progressive motion compared to the rapid motion of the wind with them; a fact which we could never find any explanation for till Col. Reid's work called our attention to the rotatory theory.

We shall conclude by giving one recommendation as to the preparation of a ship for a hurricane, which we have had the good fortune to hear from the lips of the ablest seaman and one of the greatest officers alive—we mean Sir Thomas Hardy, the veteran warrior, who, after a life of constant service and constant distinction, has retired to a situation of leisure which, were he to devote it to the simple record of his own seamanlike thoughts, might render the close of his career as permanently useful as its whole course has been brilliant. Sir Thomas Hardy was in command of the *Triumph*, one of Sir Richard Strachan's squadron, so many of which were dismasted in a hurricane in 1806. He, however, saved his masts, by striking his lower yards and topmasts; a proceeding which many officers, unacquainted with its advantages, or not knowing the facility with which it can be done, even in the largest ships, may not unnaturally shrink from. After the hurricane, Sir Richard Strachan, whose ship was disabled, hoisted his flag on board the *Triumph*, and a gale came on almost equal in violence to the hurricane. Sir Thomas astonished the admiral, who was a perfect sceptic as to the practicability of such a measure, by getting all ready to strike lower yards as the gale increased. He allowed it to be done, however, and as the gale moderated he expressed a wish to have the foresail set as soon as possible. The fore-yard was instantly swayed up, the sail let fall, reefed, and set almost as quickly as if it had been the fore-topsail! Nor were these solitary instances; for we have heard Sir Thomas Hardy say that he was in the current practice of striking his lower yards and topmasts whenever the indications of the barometer, and other circumstances, conspired to give warning of a severe gale. We have reason to believe also, that Sir Thomas Hardy was one of the earliest to avail himself of the vast advantages of the barometer; an instrument

which, after the sextant, the chronometer, and the nautical almanac, is unquestionably the greatest boon that science has conferred on modern navigation.

We must not conclude this protracted, but still imperfect notice of Col. Reid's work, without calling the attention of the proper authorities to the atrocious system of plunder and absolute piracy, which still prevails, under the name of *wrecking*, in various parts of the world, especially amongst the islands of the Gulf of Florida; a region over which a far greater number of storms pass than seem to fall to its share.

"The interests of navigation and of the social world," he properly observes, "require that a strict control and watch should be maintained over the conduct of the inhabitants of these islands, which border one of the most frequented as well as the most dangerous thoroughfares in the ocean."—p. 127.

These remarks bring to our mind a story which the late Sir Walter Scott used to repeat with great unction, but which he has unfortunately omitted in his amusing journal of the voyage he took amongst the northern islands of Scotland in the *Lighthouse Yacht*. It appears that the island of Sanda is one of the worst situated for navigation, and the best for wreckers, of any amongst the Orkneys; and the story goes that a worthy minister of that dangerous isle,

"Whose barren beach with frequent wrecks is paved,"

sympathised so deeply with the interests of his flock, that in winding up his prayer for mercy and safety to all mankind, he added—

"Nevertheless, if it please thee to cause hapless ships to be cast on the shore, Oh, dinna forget the puir island of Sanda!"

It is with grief and shame that we feel it our duty to refer to the scandalous conduct of the wreckers on our own shores, who, during the dreadful shipwrecks at Liverpool in the storm of last January, thought only of pillaging the ships, while their crews were left to perish! and had it not been for the admirable conduct of a single steamer, which went out while the gale was still blowing, scarcely a soul would have been saved!

ART. II.—*Leçons sur la Philosophie Chimique professées au Collège de France par M. Dumas, recueillies par M. Bineau.* Paris: Ebrard. 1837.

As supplying requisite information in a popular form, we introduce to our readers the interesting course of lectures delivered by M. Dumas at the *Collège de France* during the months of April, May, and June, 1836,* and collected and published on the authority of M. Bineau, himself a chemist of some note; and we shall endeavour to give, in a connected outline, such details of the progress of the science and biographical notices of its promoters, as may prove not unacceptable to the public.

The origin of chemistry, like that of some other sciences, is veiled in impenetrable obscurity. It is not easy to determine the primitive import of the word, but it has been traced to *Kema*, the book of secrets given by the *Egregori* to the fair daughters of men when these were seduced to their embraces, by which means the knowledge of the sublime science was first imparted generally. It was, however, certainly the name of an art of some kind—but the term, it is said, comprehended originally among the Egyptians the whole of natural philosophy, and afterwards implied the working of metals.

Borrichius and Lenglet du Fresnoy, though they do not assert the divine origin of the science, have classed the eighth descendant of Adam, Tubal Cain, the supposed Vulcan of ancient mythology, as the first chemist whose name has come down to us. We shall examine these points presently.

Mankind must have early acquired some chemical knowledge. Ancient writers, with one accord, though only from their common ignorance, attribute the origin of chemistry to the Egyptians; and the term has been even derived from the old name of Egypt, *Chemia*, which, according to some, it took from Cham, the son of Noah. Two pretended individuals of this nation signalized as chemists are, Thoth or Athotis, surnamed Hermes or Mercury, the son of Mizraim or Osiris and grandson of Cham; and Sephoas, styled king of Egypt, who lived about 800 years after Thoth and 1900 B. C. The latter, to whom the Greeks gave the surname of Hermes Trismegistus, the second Mercury, is regarded as the founder of natural philosophy. The titles of his reputed work on philosophy, which consisted of forty-two

books, have been given by successive writers; but it is not known that any of them treated expressly of chemistry, notwithstanding that the science has been termed after him the Hermetic Philosophy.

The Egyptians in truth cannot properly be considered as at any time acquainted with the science of chemistry; but they were early made aware of various chemical facts, and many and indubitable proofs of this have been collected in one or two not inconsiderable works devoted to the subject. Their progress in the manufacture of not only white but coloured glass, may be instanced. Seneca informs us that they made artificial gems of extraordinary beauty.* They had a method of purifying natron, and of extracting potash from cinders; they prepared lime by the calcination of calcareous stones, and had an intimate knowledge of the uses to which it may be appropriated, as also that it renders the carbonate of soda caustic. Pliny extols their beautiful pigments;† and Baron Denon's testimony to the durability of their colours on mummy cases is confirmed by our own experience. "The green alone appears to have faded; it is sometimes compounded with the blue, though the blue is metallic, the yellow vegetable. The nature of the white, which is most durable, has not been discovered. The red is very brilliant. Red, blue, yellow, green, white, and black, are the colours to be found either on the mummy-cases or the walls of the tombs."‡

This industrious people understood the art of smelting and working gold, silver, copper, lead, brass, and iron. They had also processes for extracting and combining different metals, and producing alloys and other metallic preparations. Litharge, together with the vitriolic and many other salts, were perfectly known to them. They made wine, vinegar, and even beer. Their method of embalming, whatever it was, may be reckoned among the evidences of their chemical knowledge: the statements on this subject by Herodotus and Diodorus Siculus are very unsatisfactory; and there is reason to believe, as it was the object of the embalmers to shroud their art in mystery, that those writers were either totally deceived, or at least that the mummifying drug was artfully concealed from their knowledge.§

* Epistle xc.

† Lib. xxvi. xxvii.

‡ Pettigrew's *History of Egyptian Mummies*, 4to. 1834, p. 116.

§ Modern science, it appears, has rivalled the Egyptians even in this art, which has so long eluded the world; and a patent has been obtained in England, and also in Paris, for an improved process of embalming and preserving subjects

* We understand that M. Bineau does not intend to publish the course of 1837.

The Hebrews, not impossibly, derived what chemical knowledge they possessed from the Egyptians, during their sojourn among them. The great lawgiver of the Jews has been placed in the number of chemists, from the knowledge that enabled him to dissolve the golden idol worshipped by his people; and dissertations have been written to prove that this solution of gold in water was accomplished by the aid of liver of sulphur, &c. processes which would require a considerable knowledge of chemistry. Our ignorance of the state of science at that time renders incredulity easy, though not always safe, as has been lately proved.

Most of the chemical arts cultivated by the Egyptians spread into Greece: but in following their processes the latter took little pains to discover the causes of the effects they were able to produce. Their ancient philosophers were not devoted to the cultivation of the physical sciences. Plato indeed has described the process of filtration; Hippocrates 400 B. C. was acquainted with that of calcination; and Galen speaks of distillation *per descensum*. Democritus of Abdera, 500 years B. C., employed himself in researches into the nature of plants and precious stones; and Aristotle and Theophrastus treated of stones and metals. The alloy of metals formed at Corinth has been much celebrated. At Lesbos there was a manufactory of glass; and cinnabar was used in some parts of Greece.

The Chinese historians on this, as on other occasions, have claimed the precedence for their countrymen, representing them as immemorially acquainted with various chemical facts, and among the rest with the knowledge of gunpowder. Be this as it may, at the present day they bring, without theory to guide them, some arts to

for anatomical purposes. It is stated that the English patentee addressed a letter to one of the members of the Royal Medical and Chirurgical Society, detailing some curious experiments he had made in order to show the preservative qualities of a fluid which he believed entirely prevented the ordinary effects of putrefaction in animal bodies after death; and inviting the fellows of the society to view the body of a man who died on the 5th and was embalmed on the 9th of November. This communication was accompanied by several specimens of birds—a large Dorking fowl, a pheasant and a pigeon—which had been subjected to the process, and which were found, at the end of more than two months, in a very extraordinary state of preservation; the flesh being perfectly soft and elastic, and not the slightest smell or taint discoverable, although no care had been taken to empty the crops of half-digested food, nor the intestines of feculent matter; nor had the birds been kept otherwise than freely exposed to the air of a common room with a fire in it.

a degree of perfection that might well nigh sink us into despair: as do also the Hindoos, to whom is attributed the invention of the nitrate powder. To these last we are indebted for many ingenious processes, and their manufacture of dyes eclipses all that can be accomplished in Europe; thus fully demonstrating that it is possible for mere practice, pursued with steadiness and accompanied by judicious observation, or even for simple chance, to lead to more perfect methods than obtained by theory. The Tyrian purple is a remarkable proof of the excellency some nations have attained in particular arts. The genius of Sir Humphry Davy, devoted assiduously to the subject, could not, with all the advantages of modern science and theories, discover the process of manufacturing this dye.

The military spirit of the Romans found little leisure for the cultivation of the physical sciences; indeed the sciences generally owe little to them, whatever the fine arts may have gained. So far from advancing chemistry, they may have contributed to its decline; for it is affirmed by Suidas that Dioclesian caused the books of the Egyptians—who even to his time had sustained their reputation as promoters of this science—to be burned, in order that he might subdue them with the greater facility; as he imagined they retained the secret of making gold, by means of which they were enabled to resist his power.

The Arabians may be regarded as early cultivators of chemistry; but the science with them had another and more limited meaning—the *art of making gold*. They have been considered the first alchemists simply, as some conceive, for adopting the Greek term *Χημία*, *Chymia*, with their own definite particle *al* prefixed. The invention of the Alembic also has been attributed to them, and on no better grounds: the word *ἀμβίξ*, *ambix*, was, however, used long before by Dioscorides.

The origin of the opinion that gold might be made by chemical process is unknown. Julius Firmicus Maturnus, at the beginning of the fourth, and Æneas Blasius in the following century, speak of the art as well known.* It was certainly practised by the Greek ecclesiastics, and perhaps passed from them to the Arabians: Suidas appears

* A belief that gold could be extracted if not made from certain minerals must have been much more ancient, as appears from a passage of Pliny: "Invitaverat spes Caium principem avidissimum auri; quam ob rem jussit excoqui magnum auripigmenti pondus, et plane fecit aurum excellens, sed ira parvi ponderis, ut detrimentum sentiret."—*Hist. Nat. lib. xxxiii. cap. 4.*

to have considered the term *χημεία* implied only the *making of gold*. The alchemists pretended that some traces of it are found in the hieroglyphical books of the Egyptian priests, under the veil of which they concealed their mysteries, and that the temple which the Egyptians consecrated to Vulcan was in honour of alchemy. Others maintained that it was above human capacity, and that it was revealed by God; they styled themselves *adepts*, and affirmed that they were not at liberty to impart the secret, for, if they did, some dire calamity would befall them.

Leaving to the last some notices connected with the Eastern part of the subject, it is only about the eighth century of our era that we can form an accurate view of the science among the Arabians; for near this time lived Geber, of Tus in Khorasan, a province of Persia, author of the most ancient works on the subject which have descended to us; in one of which, the "*Summa Perfectionis*," he appears to have collected all that was known of chemistry at that period. Written with an alchemical view, the belief in the transmutation of metals and in an universal medicine is plainly indicated. Geber gives indeed his *red elixir* which is only a solution of gold, (and the same word expresses both,) as a remedy for every disease, and as a means of prolonging life indefinitely and renewing the bloom of youth. To give some idea of the chemistry of Geber's time, we quote the following passage from the best treatise written by him, entitled *De Investigatione Magisterii*.

"To pretend to extract a body from that which does not contain it, is folly. But as all metals are formed of mercury and sulphur more or less pure, (besides these two, Geber recognized a third principle, arsenic,) we may add to them that which is wanting, or take away that which is in excess. To accomplish this, art employs the means proper to each body. These are the kinds which experience has taught us; calcination, sublimation, decantation, solution, distillation, coagulation, fixation, and procreation. As to agents, these are—salts, alums, vitriols, glass, borax, vinegar, and fire."

Chemical knowledge remained chiefly in possession of the Arabians for a long period after Geber, during which the science was cultivated by several distinguished men, whose names have descended to us; among them may be mentioned Rhases and Avicenna as the first who applied chemistry to medicine. Benalt, a monk, is said to have invented glass in England in the seventh century; and the Arabians at the beginning of the eighth introduced chemistry into Spain. It is said to have come to the

general knowledge of Europe during the Crusades; and soon after these expeditions almost every one of its nations became filled with searchers after the philosopher's stone.

One of the earliest known practisers of chemistry in Europe, and assuredly the most distinguished writer on the science of his day, was that redoubtable hero of our childhood's favourite romance—the mighty magician of the old writers—whose name is now recalled to our recollection chiefly with the association of the wonderful brazen head. Roger Bacon was a Cordelier friar. He was born near Ilchester in Somerset, in the year 1214; and studied at Oxford, and afterwards at Paris. In perusing his writings we are struck at the same time with the exactness of his knowledge and its universality, and with a depth of thought scarcely credible considering the time when he wrote. He was acquainted with the mechanics of his day, and his notions on physics are particularly clear; in short, making due allowance for his alchemical bias, we are astonished at the frequent precision of his views, many of which his illustrious namesake and successor did not hesitate at appropriating without any acknowledgment.

The association of the idea of magic with chemistry at this dark period of history, is attributable to their origin and union in the Eastern world; but the notion must have been wonderfully strengthened by the mysterious and hyperbolical statements of the early followers of the art. Credulous themselves, they naturally deceived others. Nor is Roger Bacon free from this peculiar mysticism; and it would require no very great stretch of imagination, after reading his treatise "*De mirabili potestate Artis et Naturæ*," where the power of art and nature is curiously exaggerated, to fancy him acquainted with balloons, diving-bells, suspension-bridges, steam-engines, &c.* These

* These exaggerations are pleasingly noticed by Sir Francis Palgrave, in his interesting little work, entitled, "*Truths and Fictions of the Middle Ages—The Merchant and the Friar*;" in which the Friar is represented as saying,—"*Bridges, unsupported by arches, can be made to scan the foaming torrent. Man shall descend to the bottom of the ocean, safely breathing, and treading with firm step on the golden sands never brightened by the light of day. Call the secret powers of Sol and Luna into action, and I behold a single steersman sitting at the helm and guiding the vessel, which divides the waves with greater rapidity than if she had been filled with a crew of mariners toiling at the oars. And the loaded chariot, no longer encumbered by the panting steed, darts on its course with resistless force and rapidity. Let the pure and simple elements do thy labour. Bind the eternal enemies, and yoke them to the same plough.*"

overcharged assertions have, not without ample grounds, raised a doubt as to Roger Bacon's claim to the invention of gunpowder, which he manufactured nearly a century before the time of Swartz, generally reputed the discoverer. We learn from the preface to the work quoted below that there are two other remarkable examples of the possession of the same receipt, towards the conclusion of the thirteenth and the beginning of the fourteenth centuries, which exist only in MS., and have hitherto not been noticed. The first is given in an incited epistle containing a selection of eighty-eight "experiments," preserved in the Bodleian Collection (Digby MS. 67), and purporting to be translated from Arabic into Latin; it is addressed to one Anselm, by Brother Ferrarius or Efferarius, of whom little is known except what appears by his designation, and that he is claimed as belonging to one of the northern provinces of the Spanish peninsula. The second is found in a manuscript once forming part of the Spelman Collection, and now possessed by Mr. Hudson Gurney,—not in a regular treatise, but in a page of collectanea—traditional rhymes and proverbial sayings,—and is in all probability much older than the era when it was thus jotted down. We give M. Dumas' version of Bacon's receipt in order that our readers may compare with it the two others above-mentioned, which we offer in a note—premising that the chemists, after all, have not found the former susceptible of a satisfactory solution: "*Sed tamen salis petræ LURU VOPO VIR CAN UTRIET sulphuris, et sic facies tonitrum et coruscationem, si scias artificium.*"*

Make the contraries unite, and teach the discordant influences to conjoin in harmony. Aid the antagonists to conquer each other; and do thou profit by their mutual victories."

* The carbon and the doses, it is seen, are designated in the above in an enigmatical manner; the Spaniard, it will be observed, enters into de ails:—

"Accipe partem unam, aut libram vel unciam sulphuris vivi, duas libras carbonum salicis sive tilhæ, et sex libras salis petrosi: tere subtilissime in lapide marmoreo vel porfirico. Postea pulveris ad libitum in tunica reponatur volauli vel tonitrum faciente. Notandum est quod tunica ad volandum longa debet esse et gracilis et prædicto pulvere optime concultato repleta; tunica facies tonitrum debet esse brevis et grossa, et prædicto pulvere semiplena et ab utraque extremitate filo forissimo bene clausa. Et nota quod in qualibet tunica foramen parvum faciendum est, ad hoc, quod tenta in illo reposita valeat illuminari; tenta vero in ambabus extremitatibus debet esse gracilis, in medio vero lata et prædicto pulvere bene repleta. Nota etiam quod duplex poteris facere tonitrum ac duplex volatile instrumentum, videlicet, tunicam subtiliter in tunica recludendo."

But although we concede to Bacon the knowledge of compounding the ingredients constituting gunpowder, we cannot assent to the assertion of Sir Francis Palgrave, that he "had attained the knowledge of the process of *granulation*—so simple, and yet so concealed from his contemporaries, and by which the commixture of ingredients alone obtained its mischievous perfection." It seems extremely improbable that this process, which is not even essential to the manufacture of perfect gunpowder, should have been thought of before the invention of fire-arms; for the more convenient use of which only granulation was necessary. For all purposes to which Bacon could have applied it, it would have been more effective in fine dust than in grains.

Perhaps it is unnecessary to remark, that there is not in any of Bacon's works any real foundation for those marvellous tales of which he has been made the subject. Indeed, in his chief work, entitled "*Opus Majus*," although he sufficiently evinces a failing shared by him in common with the age in which he lived, in expressing a belief that certain chemists have been able to make the precious metals and discover the means of prolonging life during many ages, he does not intimate that this was to be attained by the intervention of supernatural means, but simply by dint of repeated experiment, unwearied observation, and indefatigable application. Even in his small treatise, "*De mirabili potestate Artis et Naturæ*," he particularly dwells on the absurdity of believing in necromancy and charms; and mentions various ways in which men may be deceived by jugglers, ventriloquists, &c. But these sound views were not shared by the brethren of his order; they accused him of magic, and he was accordingly thrown into prison.

Several inventions are ascribed to Roger Bacon besides the brazen head; a locomotive chariot, a flying machine, the telescope, camera obscura, &c.

The field of science was at the same time occupied by another remarkable personage, hardly less distinguished than our own countryman, and who also had the reputation of being deeply skilled in the black art, his wondrous feats having likewise furnished

The Spelman receipt is as follows:—

"De mixtione pulveris ad faciendum le Crake. Primo accipe quantitatem quantum volueris de salpetro, et pondera eam per quatuor partes equales. Deinde accipe unam partem ex illis, et contra illam, pondera sulfurum vivum. Deinde divide ipsum sulfurum vivum in duas partes, et contra unam partem ex illis duobus, pondera carbonem de salice. Omnibus istis aggregatis, fiat pulvis."

the nursery with not a little of its lore. Albert of Bollstädt (or Albert the Great) was born in Swabia in 1205. He joined the order of Dominican monks at Cologne, and became at length bishop of Ratisbon. Like his great contemporary he embraced every department of learning: "Magnus in magiâ, major in philosophiâ, maximus in theologiâ." His works are numerous, but those relating to chemistry are only two tracts. The first is entitled "De Alchymia," in which he gives a distinct account of all the chemical substances known in his time. He likewise describes the instruments then in use, and the various operations they had occasion to perform. The second is on Minerals. The knowledge he displays of the chemical properties of stones, metals, and salts, is remarkable.

One of the works attributed to Albert is doubtful, namely "Lilium de Spinis evulsum;" and others are evidently spurious, such as the "Secrets du Petit Albert," and the "Traité des Secrets du Grand Albert." The style of these tracts is different from that of Albert, the master of Thomas Aquinas,* and they were doubtless palmed upon him by the alchemists after his death.

Popular belief assigned to Albert also a superhuman agent which resolved his difficult propositions. But instead of a brazen head, he had the advantage of an entire man, called the *Androïde* of Albert; which, M. Dumas shrewdly surmises, may have been a calculating machine, personified by superstitious exaggeration. The wonderful invention, then, of Mr. Babbage may have had a prototype at this remote period!

To give some idea of the feelings with which alchemists were regarded at this time, we quote the following anecdote, describing an achievement which certainly entitled its hero to rank in the same category as Friar Rush.

"Albert invited a certain Count of Holland to dine. To pay due honour to his distinguished guest, he had a table prepared in the midst of his garden. This naturally much astonished the count and the nobles who accompanied him; it being in the depth of winter, and many feet of snow on the ground. But the instant Albert placed himself at the table, the snow disappeared: a mild heat succeeded the rigours of the cold, the trees clothed themselves with foliage, flowers perfumed the air, and myriads of joyous birds vied with each other in their melody. This scene continu-

ed during the whole repast. But the moment the dinner was finished, the enchantment vanished, and winter reappeared in all its horrors."

France, too, produced about the same period a celebrated individual, who applied himself to chemistry with great success. Arnold of Villeneuve was born at Villeneuve about the year 1240. His reputation as a physician was so great, that his attendance was solicited by kings, and even by the Pope himself. He was skilled in all the sciences of his time, and was moreover a proficient in Arabic, Hebrew, and Greek. He studied astrology at Paris; and having calculated the age of the world, ascertained that it would terminate in 1335. This prophecy, together with other of his opinions, brought upon him ecclesiastical censures—and the theologians of Paris condemned the astrologer as a heretic, which compelled him to leave France. He died in 1313, twenty-two years before his predicted end of the world.

Although distillation was practised long before Arnold's day, he first acquired the knowledge of some of the most important products extracted by this means. He has likewise the reputation if not of discovering spirits of wine, at least of finding out its principal properties. He possessed the philosopher's stone, and gives receipts for making gold, "but in terms unintelligible without being initiated in the enigmatical language in which the chemists hid their discoveries real or imaginary." The most curious of his tracts is his *Rosarium*, which comprises all the alchemy of his time.

But we find a more perfect model in a pupil of Arnold of Villeneuve—Raymond Lully, whose remarkable history is given by M. Dumas, and of this we add an epitome. Raymond Lully was born at Majorca in 1235, of a rich and noble family. After passing the earlier part of his life in dissipation, he became violently enamoured of a beautiful lady. She absorbed all his thoughts. To celebrate her charms he exhausted prose and verse. At length, wearied by his incessant importunities, she, at an interview sought for the purpose, unrobed to him her breast, the subject of his loftiest eulogy, and chilled his glowing passion by discovering a frightful cancer.

Struck with horror and humbled by disappointment, the chastened lover determined to renounce the world; accordingly he distributed his goods to the poor, entered a cloister at the age of thirty, and applied himself to the study of theology, languages, and the physical sciences. Soon after this

* Thomas Aquinas has also left treatises on alchemy, but veiled in a mystery equally profound with that which shrouds his other labours. It is in the works of that theologian that we first discover the combination of astrology with this art.

he conceived the idea of forming a crusade, of which the object, singularly enough, was the conversion of the Algerines and the abolition of slavery. In order to perfect himself in the language of the country, he employed a Mahometan slave who, having penetrated the intentions of his master, thrust a dagger into his breast. The wound, however, was not mortal, and the missionary's apostolic zeal was unabated. After having visited and made his scheme known to nearly all the courts of Europe, meeting with little success, he determined to embark alone for 'Tunis.' Here he invited public disputation on religion, but was soon arrested and thrown into prison; shortly after he was put on board a ship, and sent to Italy.

In spite of his ill fortune, after a short period the self-willed apostle returned to Africa, and recommenced his preaching, at Bougia; but the populace, incited against him, stoned him to death. Some sailors carried his corpse to his native country, where he was honoured as a saint.

Throughout this stormy and adventurous career, so unfavourable to the cultivation of the sciences, the zealous alchemist produced works worthy of notice, making due allowance for the faults of his age. The multiplicity of these works is one of the reasons which have induced a belief, sufficiently unfounded, that there were two Raymond Lullys—the theologian and the chemist. Raymond was currently believed to have possessed the philosopher's stone. Indeed Robert Constantin affirms that he inspected one of the rose-nobles struck in the Tower of London, out of the gold made by him, in the years 1312 and 1313. Raymond Lully may be said to have formed a school of alchemists; but he gave a useful turn to their labours, for in seeking the philosopher's stone by the *via humida*, and employing distillation as the means, he directed attention to the volatile products resulting from the decomposition of bodies.

Raymond was also the inventor of the Athanor furnace; an indispensable requisite with the old chemists who during their long operations required their fires to be constantly supplied with fuel in proportion to the consumption: to this purpose the Athanor furnace was peculiarly adapted.*

* Perhaps the reader curious in these matters, may not consider the description of this kind of furnace superfluous, although it has long since fallen into disuse. "Beside the usual parts, it was provided with a hollow tower, into which charcoal was put. The upper part of the tower, when filled, was closely shut by a well-fitted cover; and the lower part communicated with the fire-place of the furnace. In consequence of this disposition, the char-

We soon encounter two other alchemists deserving of particular notice. John Isaac Hollandus, and his countryman of the same name, who were either brothers or father and son, were born at Stolk, in Holland, some time in the thirteenth century. Their treatises on chemistry are more useful than others of this period; for they are not only written with clearness, but accompanied with descriptions of their different processes, and figures even are given of the instruments which they employed; from which it is curious to observe that many of the processes generally considered of modern date were well known to them.

A long period succeeds without affording, with the exception of Basil Valentin,—a Benedictine monk, born in 1394 at Erford in Germany, and the first who applied chemistry to medicine in Europe,—one chemist in any thing like the proper sense of the term. Basil Valentin was the author of the "*Curus triumphalis Antimonii*," in which he taught the art of obtaining antimony: and from his time dates the use of this important mineral in medicine. Alchemists nevertheless abounded; and alchemical adventurers wandered about the country extorting money on pretence of imparting their secret. One of these votaries of mammon may be noticed from his reputation in other respects—viz. Jean de Meun, author of the "*Roman de la Rose*," who devotes some minor poems expressly to the disinterested purpose of unfolding the process necessary for the formation of the philosopher's stone. Nicholas Flamel may also be mentioned on account of the high celebrity he obtained and the pains that have been taken to ascertain his real—which, it need hardly be added, entirely disproves his reputed—history. It was pretended that he possessed the secret; that he amassed immense wealth, part of which he expended in building houses and even churches; and that he and his wife, feigning death, fled to a far country, became immortal, and possessors of inexhaustible treasures.

The year 1527 was an important era in the annals of chemistry. The first chair was founded at Basil, and Theophrastus Paracelsus was invited by the magistracy of that city to fill it—thus becoming the first public professor of the science in Europe. This extraordinary man was born in 1493, near Zurich. His father, who was a physician, instructed him in physic and surgery. But alchemy was his ruling passion, and he

coal subsided into the fire-place gradually as the consumption made room for it; but that which was contained in the tower was defended from combustion by the exclusion of a proper supply of air."

studied it first under the care of Trithemius, abbot of Spanheim, and afterwards of Sigismund Fuggerus. Paracelsus greatly promoted the application of chemistry to the use of medicine. Still he was affected with the usual mania; but, unlike most of his predecessors, abandoning the philosopher's stone he applied himself chiefly to procuring the panacea, and discovering the means of lengthening life to an indefinite period. For in his works he makes a clear distinction between the *panacea* and the *elixir of life*. To accomplish his objects he made essences and quintessences, arcanæ, specifics, and elixirs. Indeed he was early in possession of the secret of the philosopher's stone, which he learnt, as he asserted, at Constantinople, in the suite of the son of the Czar of Russia whilst on an embassy to that capital. A curious chance advanced him to this honour. After having visited most of the universities of Europe, he was taken prisoner by the Tatars, and brought before the Czar, who sent him with this mission.

Paracelsus occupied the chair some time. The occasion of his quitting it is singular enough.

"Although professing chemistry, he likewise exercised medicine. Having been summoned to attend a monk grievously sick, before he undertook the cure, he was anxious to make his market. The patient promised a handsome fee for his services. Paracelsus administered two opium pills, by which a speedy recovery was effected. Cured so rapidly, the monk considered the promised fee too exorbitant, and refused to pay it. A lawsuit ensued; the matter was referred to an arbitration of physicians, who were of opinion that a slight remuneration should content the practitioner, as the patient got well so quickly. Paracelsus, having lost his cause, manifested on the trial a degree of anger which raised a hostile feeling against him, and at last forced him to leave the country."

Deprived of all resources, he wandered about for some time in abject poverty, and died at Strasburg in September, 1541; thus satisfactorily demonstrating the emptiness of the boast which yet he persisted in during his whole life, of possessing the wonderful "elixir proprietatis," which would not only cure all manner of diseases, but enable him to count the number of years to which the oldest antediluvian patriarch attained. He died, it is said, a victim to the jealousy of his rivals, who poisoned him in a debauch of wine, a beverage to which he was much addicted.

The death of Van Helmont, who also gave out that he was in possession of the

elixir,* consummated the disgrace of the universal medicine, which was soon, like the philosopher's stone, regarded by all practical chemists as an idle dream. And here may be drawn the line of demarcation between the Alchemist and the Chemist properly so called.

"Indeed it is with unfeigned surprise that we behold, after a long absence, a real alchemist make his appearance in England in the person of Dr. Price, in 1703. This man produced a red and white powder, by means of which he could transmute mercury into gold or silver at will. He made the experiment before a great number of persons publicly, and at seven different times. The Royal Society of London, who had at first viewed with indifference this experiment on public credulity, found themselves under the necessity, as Dr. Price was a member of their body, of investigating it: they therefore appointed a committee to scrutinize the matter. When Dr. Price found himself necessitated to perform his operations under the eyes of the members of the Society, he pretended that he had no more of the powder, and resorted to other subterfuges. The Society allowed the Doctor time to make his preparations, and the following year challenged a trial of his secret; but the alchemical adventurer terminated the mystery by poisoning himself."

Before taking leave of the alchemists it may be as well to devote a moment to a consideration of their peculiar notions. Imagining that the ingredients which compose gold are to be found in all metals, but so contaminate with various admixtures as to require a high degree of purification to reduce them to their perfect state, they regarded fire as an agent of illimitable power. Nothing could be done without it—with it everything was possible. Through the medium of this element they could render minerals from the earthy into a metallic condition, and the change which the earths underwent warranted, they imagined, the belief of a still higher degree of perfection; they thought that by means of fire, if properly conducted, they might bring the baser metals to a much more perfect state—indeed, transmute them into gold. But they believed that this purification could be instantly accomplished by a substance which they called

* The follies of Paracelsus and his school perhaps gave rise to a society which sprung up in Germany at the beginning of the 17th century, and styled themselves the Rosicrucians. Of these little is known but the title and the work of the Comte de Gabalis; their number was never ascertained. These brothers affirmed that they were in possession of the secrets of transmutation and the universal medicine, with the science of occult things.

lapis philosophorum, and this was the great object of their researches.

But notwithstanding that the successors of Paracelsus, with a few exceptions, aimed at the real advancement of chemistry, and that this had obtained a footing among the sciences by being taught in the universities, more than a century elapsed during which little progress was made. Nicholas le Fevre may be noticed as among the first who formed anything approaching to independent views. After having held the professorship of the *Jardin des Plantes* for some years, he was invited to England by Charles II.,* who entrusted to him the laboratory established at St. James's, on occasion of the formation of the Royal Society, which received its charter from that sovereign on the 15th of July, 1662. Besides being Royal Professor of Chemistry, Le Fevre was Apothecary in Ordinary to the witty monarch, in which capacity he was required by his majesty to make up the preparation called "Sir Walter Rawleigh's Great Cordial," and which was only another name for an universal medicine, as it comprised every disease within its healing influence. As some of our readers may not be aware that the illustrious knight was famous in the arts of pharmacy, we give below, in spite of its length, the receipt for the benefit of modern practitioners; first observing that it is not exactly as originally written, but with the added wisdom of some one or two succeeding generations; for we are told by Le Fevre, in his Discourse upon this wonderful cordial, "that by the counsel and approbation of Sir Kenelm Digby and Sir Alexander Fraiser his majesty's chief physician, the flesh, the heart, and the liver of vipers have been added to the number of the ingredients of this remedy, though the first prescription doth not mention them."†

* James II. according to M. Dumas. But errors such as this which occur in the work may not be attributed to the author, as the highly popular lecturer did not publish it himself.

† "Recipe rasuræ cornu cervi libram unam; carnis viperarum cum cordibus et hepatibus uncias sex: florum boraginis, buglossæ, roris-marini, calendulæ, vetonicæ coronariæ rubræ, roris solis, rosarum rubrarum, et sambuci, singularum libram semi-sem; herbarum scordii, cardui benedicti, melissæ, dictamni cretici, menthæ, majoranæ, betonicæ, singularum manipulos duodecim; granorum kermes recenter in rob redactorum, cubebæ, cardamomi majoris, baccarum juniperi, maceris, nucis myristicæ, caryophyllorum, croci, singularum uncias duas; cinnamomi acutissimi, corticis ligni sassafras, flavedinis malorum citriorum et aurantiorum, singularum uncias tres; lignorum aloës et sassafras uniuscujusque uncias sex; radicum angelicæ, valerianæ carlinæ, fraxinellæ seu dictamni albi, serpentariæ virginianæ, zedoaræ, tormentillæ, bistortæ, aristolochiæ longæ, rotundæ et cavæ, gentianæ et imperatoris,

A detail of the opinions of Le Fevre would hardly be worth the space, but we quote the following to show how difficult the chemists found it, at this time, to keep within the trammels of Aristotle.

"The peripatetians found in the flame of wood while it burns, in the smoke which exhales from it, in the water distilled thence, and in the cinders which it leaves, the four natural elements of bodies. But in the opinion of Le Fevre this mode of destruction did not develope all the (first) principles of matter. It was necessary to seek them in the products of distillation. Now what did he obtain, whether in distilling wood or any kind of vegetable or animal matter? He saw gas disengaged which he mistook for air; he collected an aqueous liquor charged with acetic acid, which afforded him at the same time water and spirit; for vinegar was considered by the old chemists an acid spirit. He obtained also another liquor of an oleaginous appearance, and of an inflammable nature, which presented to him oil or sulphur. In short, in the residuum he found a charcoal which by combustion resolved itself into heat and cinders, thus furnishing the two last principles. Treated by water, they separate in effect into two parts; one soluble, salt, the other insoluble earth. Here then we see water, spirit, oil, salt, and earth, first products of the decomposition of bodies, which a chemistry, more advanced, has been able to decompose in their turn."

But we must trace almost another century before we discover the real basis of a science which is the delight and astonishment of the present day. Still distinguished men were not wanting during this period;—and the most remarkable—the illustrious Beccher and his disciple Stahl—deserve a particular notice.

John Joachim Beccher was born at Spire

singularum unciam unam et semissem. Omnia incisa et grosso modo contusa in vase idoneo posita cum spiritu vini rectificato extrahantur secundum artem. Tincturæ filtratæ in extractum mediante, in Mariæ balneo, distillatione evaporentur. Magma expressum comburatur; cineres reverberati per aquam elixivientur, unde sal purum lege artis pareatur, quod extracto misceatur. His ita peractis, huic extracto adde, ut artis est, pulverem sequentem cæteraque ingredientia. Recipe lapidum bezoardicorum orientalium et occidentalium verorum uniuscujusque unciam semissem, magisterii solubilis perlarum orientalium uncias duas, magisterii solubilis corallorum rubrorum uncias tres; boli orientalis, terræ sigillatæ veræ, unicorну mineralis, cornu cervi philosophicè præparati, et cornu cervi calcinati, singularum unciam unam; ambre griseæ electissimæ in essentiam redactæ unciam unam; moschi orientalis optimi essentificati drachmam unam et semissem; croci solis cum tinctura antimonii Basilii Valentini parati drachmas duas; sacchari candisati albi subtilissimæ pulveris albi libras duas. Ex his omnibus mixtis et ex arte unitis fiat confectio verè regia, quæ ad usum reservetur in pyxidibus apprimè clausis."

in 1635, and appears to have been of Jewish extraction. After being physician to the Elector of Mentz, and also to the Elector of Bavaria, towards the end of his life he went to England, and died in London, in 1682, in great poverty it is said. His work entitled "*Physica Subterranea*" is the best treatise up to this time; indeed he may be regarded as the first who really guided the researches of the chemist into the right channel.

George Ernest Stahl was born at Anspach in 1660. As a physician he acquired considerable celebrity. He was successively first physician to the Duke of Saxe-Weimar and to the King of Prussia. Almost from infancy he had imbibed a violent passion for chemistry, and at an early age could repeat the whole of the "*Chemia Philosophica*" of Barnerus. He applied himself particularly to the writings of Beccher, and was the commentator of the "*Physica Subterranea*," which he characterizes as an "*opus sine pari*." His works manifest a vast genius, and display great brilliancy of imagination; but his style is hard, and his writings, especially the last volume of his "*Principles of Chemistry*," present moreover a novelty of which it is difficult to find in science another example. Latin and German are continually intermixed, the German and Latin and Latin and German words succeeding each other in violation of every rule. As it would be impossible to form any idea of this compound without having a portion of it presented to our eyes, we subjoin a short specimen. He is describing the action of sulphuric acid on marine salt, and the characters of the sulphate of soda which results from it: "*Ex hujus deinde remanentiâ seu capite mortuo, woraus der spiritus salis getrieben worden, bleibt ein novum concretum salinum Zurückge compositum ex alcali salis et acide vitrioli . . . id est sal mirabili Glauberi, welches eine brüchige, fragilem et friabilem mollem consistentiam hat, aquam abundantem, feucht, daher es im Feuer ebullirt wie Alaun.*"

Stahl is best known as the originator of what is called the phlogistic theory, which perhaps cannot be more concisely stated than in the following extract we give from M. Dumas.

"According to Stahl the oxides are indecomposable; the phlogiston* unites with

them, and the metals are produced by this union. The metals consequently contain phlogiston, and still more carbon. All combustibles are more or less charged with it.—During the time a body is burning it disengages phlogiston; and the more inflammable a body is, the more it disengages. If the oxide of lead, heated with charcoal, passes into a metallic state, it is because the charcoal in burning abandons its phlogiston, and the oxide possesses itself of it. In short, in the opinion of Stahl, a series of oxides produced by an oxidation more or less advanced, represents a metal more or less dephlogisticated."

M. Dumas compares this theory with the notions of the present day.

"In a word, the theory of Stahl does not differ from ours, except that its author saw combination where we see decomposition, and *vice versâ*. Stahl would not have failed to rectify these ideas if he had paid attention to the indications of the balance; for if we take account of them, an insuperable objection presents itself at the instant. Lead which oxidizes and which is dephlogisticated, according to the theory of Stahl, augments in weight; the loss of one of its principles gives it additional weight. On the other hand, oxide of lead reduced by charcoal gains phlogiston; consequently it should weigh more than before its reduction, but it is diminished in weight."

Considerable merit also is due to Stahl, not only for discovering indecomposable bodies different from the elements of Aristotle, which some of his predecessors even from the time of Paracelsus had manfully combated and of which we have given a recent example, but also for having actually consummated this revolution in ideas.

With only mentioning Boerhaave, Margraaf, the eccentric Rouelle, and Macquer, we hasten to the period when three illustrious men, of very different fortunes and destiny, almost simultaneously threw an effulgence of light upon the science, and contributed above all others to its advancement; and who indeed may be said to have laid the foundation of the beautiful superstructure which has risen in our own time. These were Scheele, Priestley, and Lavoisier.

Charles William Scheele was born at Stralsund, Swedish Pomerania, in 1742. Though of humble parentage he was sent to college, but it is said, made very little pro-

* It was supposed that Phlogiston was the general inflammable principle; that is to say, that a certain something, called *phlogiston*, forms a part of all combustible bodies, and that its separation constitutes *fire*. This principle was never strictly defined, and might therefore be adapted to all the ordinary phenomena;—"Sometimes," says M. Lavoisier, (who, it need hardly be stated, explained this doctrine,) "this principle has weight, and

sometimes it has not; sometimes it is free fire, and sometimes it is combined with the earthy element; sometimes it enters the pores of vessels, and sometimes they are impervious to it; it explains at once causticity and non causticity, transparency and opacity, colours and the absence of colours. It is a very Proteus which changes form at every instant."

gress in learning. Seeing no prospect of his succeeding in the walks of literature, his friends apprenticed him at the age of thirteen to an apothecary at Gottenburg. He displayed considerable zeal in his profession, but did not develope any particular talent. Chance threw into his hand a work of Neuman's, a pupil of Stahl; he perused it with care, and with this book alone commenced the study of chemistry. Following the bent of his inclination with steadiness, he availed himself of every possible means of instruction in his favourite science. Kun-
 • kel's Laboratory was his favourite book. He was in the habit of repeating experiments from it instead of retiring to rest. One night, while occupied in making pyrophorus, a mischievous fellow-apprentice put some fulminating powder into the mixture. The loud explosion which ensued alarmed the whole family, and the luckless chemist was of course discovered. But in spite of the calls of a daily occupation, and restrictions on his midnight studies, he completed his education in a science which he was one day to enlighten, and in silence prepared his greatest works.

Having made some important discoveries, he repaired to Stockholm. Disappointed in his first overtures with the Academy of Sciences of this capital, he quitted it, and repaired to Upsala, where Bergman professed chemistry with great success. Chance brought this great man in contact with the humble apothecary; he discovered his talent, and formed a lasting friendship with him. Bergman sought every means to establish his young friend; the direction of some manufactories belonging to the state was offered him; the King of Prussia endeavoured to attract him to Berlin. But fearing everything which might distract him from his favourite pursuit, the votary of science sought a retirement where he might isolate himself from the world. He was informed that at Kœping, a small village in Sweden, there was a shop in possession of the widow of a deceased apothecary, of some wealth. He quickly repaired to the place, made the necessary arrangements, and established himself with the widow. But instead of a life of ease and tranquillity he met with one of labour and disappointment. The estate was loaded with debts, and the widow possessed nothing. Nevertheless the luckless chemist applied himself cheerfully to labour, dividing his time between his researches and the duties of his shop. By dint of indefatigable industry he gained 600 livres a year, 100 of which he reserved for his personal wants, and devoted the rest to science.

From his obscure situation, the discoveries of Scheele might have remained a long time in oblivion: but they found an echo in Bergman, who patronized him with zeal. As soon as Scheele from his retreat announced a discovery, Bergman hastened to propagate it to the world, taking upon himself the charge of publishing his treatises; and whilst his own countrymen were almost ignorant of his existence, his renown, thanks to the correspondence of Bergman, spread through the rest of Europe.

"It is related that the King of Sweden, in his travels to a foreign state, hearing Scheele incessantly spoken of as a great genius, was touched that he had done nothing for him. He considered it only consulting his own honour to bestow a mark of esteem on such a distinguished ornament to his country, and determined to enrol him in the list of knights. The minister, commissioned to confer this title, hesitated. 'Scheele, Scheele,' he exclaimed, 'is it possible!' The command, however, was peremptory, and Scheele was dubbed a knight. But you may anticipate the sequel: it was not Scheele, the illustrious chemist, the honour of Sweden, but another Scheele, who was the object of this unexpected favour."

But the great chemist was arrested in his modest career when there seemed a fair prospect of his enjoying the fruits of his labours. His last works were ready for publication, the debts of his predecessor were paid, and his reputation was established; a malignant fever, which lasted four days, terminated fatally. He died in 1786, in his 44th year; Bergman having died two years previously, in his 49th.

As if during the whole of his life he had a presentiment that his time would be short, Scheele was resolute not to lose one precious moment.

"The President de Virly and d'Elhuyart went to see him towards the end of his short career. They found this man, whose reputation had attracted them so far, and to whom they had come to pay so touching a mark of respect, at work in his shop, with an apron on; as soon as he had learnt the object of their visit, he resumed his duties with admirable simplicity. During some days they passed at Kœping they invited him to dine; the meal finished, he returned to his labours, and the travellers did not fail to follow him."

We are indebted to Scheele for the discovery—among others—of a multitude of organic and mineral acids:—the tartaric, fluosilicic, manganetic, arsenic, molybdic, lactic, mucic, tungstic, prussic, citric, and

gallic. We owe to him the discovery of chlorine and barytes. Indeed, it would be necessary to pursue him through all parts of chemistry to form an adequate idea of his researches. Almost without means, his ingenuity and perseverance surmounted every obstacle. Duly to appreciate his labours we must take a view of his laboratory, which consisted of

"A few retorts, crucibles, or vials, beer-glasses, and some bladders, and the most indispensable necessities. He had no gas jars; drinking-glasses performed their office. If he wished to collect gas, he attached a bladder to the neck of a vial, or the beak of a retort, in which the gas was disengaged. The bladder being full, he fastened the neck with a packthread. If he wished to employ the gaseous product, he loosened the fastening compressing the bladder, and submitted the gas to the experiments which his curious mind suggested."

We come now to that extraordinary man who, in the midst of religious polemics, devoted himself to chemical science with consummate success; the discoverer of all the principal gases—who solved the question raised with respect to Raymond Lully, and proved that it was possible for a man to be a profound divine and a successful chemist. As Dr. Priestley's labours are better known perhaps than his history, we recall the outline of this latter to the reader's recollection, more especially as the peculiar incidents of his life, on more than one occasion, led to his discoveries; this, too, induced a belief, in which he all along persisted, that we are more indebted for the progress of science to chance than to laborious research.

Dr. Joseph Priestley was born at Field-head, near Leeds, in 1733. His father, a cloth manufacturer, destined him for his successor; but a religious fervour, which it is said he had imbibed from his mother, hurried him upon a more agitated scene. He was brought up in the principles of moderate Calvinism. Imagining that grace failed him, he gave himself up occasionally to a melancholy and profound sadness. That he might study more deeply the Scriptures, he learnt the Chaldaic, Syriac, and Arabic languages. He was already acquainted with Hebrew, Greek, Latin, German, and French. Gifted with a wonderful memory, he acquired languages with great facility.

At the age of twenty-five he commenced his ecclesiastical career at Needham, where he met with little success. His Socinian opinions had already raised him many enemies. He went to Sheffield, where he en-

countered similar opposition. At Nantwich he met some encouragement, and formed a little school: here also he procured an electric and pneumatic machine; and laid the foundation of that scientific education which afterwards became so fruitful.

In 1761, about the age of 32, he commenced his scientific career. In a journey he made to London, chance brought him in connection with Franklin, and the conversation of this great man inspired him with a desire of studying the electric phenomena. He now conceived the first thought of his History of Electricity, purchased the necessary books, and commenced immediately. But the many doubtful questions which presented themselves soon determined him to make those grand experiments which established his reputation.

In 1767, having been nominated pastor of a chapel at Leeds, by a curious chance he took a lodging near a brewery. The facility induced him, as he said, in order to amuse himself, to make some experiments on the carbonic acid gas disengaged during the fermentation of beer. Soon after, having changed his lodging and finding himself deprived of this convenient resource, he conceived the idea of producing the gas himself. He discovered the proper method of collecting it; and was led to the invention of the pneumatic apparatus by which we are enabled to collect and operate upon the gases.

When Dr. Priestley commenced his labours, the phlogistic system was admitted everywhere. Only two of the gases were known—the carbonic, which was called *fixed air* (discovered by Dr. Black), and hydrogen, which was distinguished by the name of *inflammable air*. Dr. Priestley began by studying these two bodies, and made a multitude of useful observations. He soon recognized the existence first of azote, then of deutoxide of azote. The discovery of this last, and of the action which it exercises on the air which has not been deprived of oxygen, was a source of real pleasure to him. Until now indeed he had only respiration itself as a reactive to ascertain in what degree an air was respirable: he was obliged to use mice, which he introduced successively in order to try the air, until they could no longer exist. His experiments, though sufficiently destructive of these animals, were nevertheless useless. In seeking to assure himself if the deutoxide of azote, which afforded him a means of analysis less murderous and more prompt, would also be more exact, Dr. Priestley was enabled to ascertain the singular antiseptic properties of this gas. Having put some mice into a vessel where there was a quantity of

deutoxide of azote, and forgotten it, he was astonished to find on examining them after the lapse of some days, that there was no sign of putrefaction. A short time afterwards he discovered the muriatic acid gas, and next the ammoniacal, previously known in a state of solution; the first under the name of spirit of salt, the second under that of spirit of sal ammoniac, or of volatile alkali: after them, the protoxide of azote, sulphurous acid, and lastly oxygen. He drew this gas from the oxide of mercury in August, 1774; but it was not till the March of the following year that he ascertained its property of sustaining respiration, and its action on the venous blood. A little later, the fluosilicic acid gas and the carbonic oxide gas were prepared by him for the first time. Besides these nine gases of which Dr. Priestley discovered the existence, we may add three others;—the sulphuretted hydrogen, the olefiant, and the phosphoretted hydrogen—thus including the principal gases of any importance in science or the arts. These are some of the wonderful discoveries of a man scarce known and appreciated for his contributions to science at the present day;—discoveries which duly to value we must consider the time at which they were made—a period when the most common gases were unknown. “It is necessary to recal these times, in order to attach due interest to the various experiments to which Dr. Priestley subjected these bodies, so strange and so new to science. His labours on the gases and the air threw an unexpected light upon the most vulgar phenomena.” It would seem that his scientific works were buried beneath the multitudinous volumes of his polemics.

To pursue the history. Quitting the calm pursuit of scientific research, the chemico-divine now threw himself into the arena of politics. In the name of the Unitarians he clamoured for liberty of conscience for all religions. This drew upon him the jealousy of the government, little disposed at that time to look placidly on innovations. The French revolution had commenced. The boldness with which Dr. Priestley advocated religious liberty, gained him in France the reputation of being an ardent republican. They bestowed upon him the title of “French citizen;” and the department of Orne elected him deputy to the Constituent Assembly. He had the good sense (like Wilberforce when the same equivocal honour was vouchsafed to him) to resist these overtures; but nevertheless he was regarded in England as an innovator. To such a degree was party feeling manifested against him, that his name used to be

chalked, with opprobrious epithets, on the walls of the streets of Birmingham. On the 14th of July, 1794, some inhabitants of the town having given a dinner on occasion of the anniversary of the French revolution, a seditious letter was circulated in the evening and was attributed to Dr. Priestley. An excited mob, after burning the house where his supposed political friends were assembled, proceeded to his own residence, where he was sitting in the bosom of his family, unconscious of the peril which awaited him. Some friends, anticipating his danger, came in time to save him. Hidden in a neighbouring house, he had the mortification of beholding his library destroyed, his instruments broken, and his dwelling in flames; but he surveyed the scene with a calmness highly creditable to his philosophy.

Leaving this scene of persecution he came to London, whence, after passing three years in tranquillity, he embarked for America. He purchased a piece of land; and there, under the protection of president Jefferson, passed peaceably the remainder of his days, which were soon lamentably terminated. He was poisoned at a repast with the whole of his family, in consequence of an accident which has never been satisfactorily explained. It proved fatal only to himself, who, now old and enfeebled in frame, could not survive the violent inflammation of the bowels occasioned by the poison.

We now come to the last but not least of the three contemporaries.

Antoine Laurent Lavoisier was born in Paris, August 16, 1743. His father, who possessed considerable property, acquired in trade, sent him to Mazarin College, where he studied the sciences with the utmost ardour, and made great progress in mathematics, astronomy, botany, and chemistry.

Lavoisier was some time undecided as to the route he should pursue; he succeeded equally in his mathematical studies and in the natural sciences. Guettard had inspired him with a taste for geology, which he pursued with great success. About this time the Academy proposed, at the solicitation of the government, a prize medal for the best essay on the lighting of the city of Paris.

“Lavoisier applied himself to the question. After some experiments, he discovered that his sight failed in the delicacy necessary to appreciate the relative intensity of the different flames he wished to compare. Accordingly he shut himself up for six weeks in a chamber totally darkened. At the end of this time his sight acquired an extreme sensibility, and the least variations could not escape him. What an extraordinary devotion to science which could support him, at the age of twenty-two, during a seclusion so

long and so severe! The Academy voted him a gold medal on this occasion."

His course was at length taken. He was resolved to devote the whole of his energies to a science, which, notwithstanding the many great discoveries recently made, was still in inextricable confusion. Lavoisier understood his task. He knew that to accomplish it a long and tranquil life was necessary. A considerable income too was indispensable. He sought and obtained an appointment as farmer-general, and soon after married Mademoiselle Paulze, daughter of one of his colleagues. His most sanguine hopes were realized. He could now devote himself to his researches with all appliances and means.

When Lavoisier accepted his new office, he drew upon himself the murmurs of the members of the Academy of Sciences, which he had entered in 1768, at the age of 25. "This young man so full of promise is lost to science," was the general cry. And when he made known to the Academy any new discovery, "Ah," said they, "what a pity that he is a farmer-general: he would have done more." But though he performed steadily the duties of his important office, he devoted the greater portion of his time to a science which—if his career had not been prematurely terminated—he must have still further advanced. The phlogistic doctrine had fallen at his touch. The dephlogisticated air he proved to be a simple body—

"That which combines with metals in the process of calcination—that which transforms sulphur, phosphorus, and carbon into acids—that which constitutes the active part of air; which nourishes the flame that gives us light—the fire which warms us;—that which in the respiration of animals changes their venous into arterial blood, at the same time that it develops the heat which is necessary; that which forms the essential part of the crust of the entire globe, of water, of plants, and of animals."

But to avoid anticipating we give an account of two or three amongst the not least interesting researches of Lavoisier.

He appears to have been the first who clearly demonstrated, that in heating brass in a closed vessel a portion of the air combines with the brass, which consequently passes to the state of oxide; that when a considerable portion of the brass is oxidized, the rest of the metal remains pure, even although the vessel still contains a considerable quantity of air, and the heat is continued; for the air thus deprived of its oxygen cannot unite itself to the remaining metal; therefore the quantity of oxide formed must be in proportion to the size of the vessel. Thus a portion of the air disappears, whilst the

metal augments in weight by the calcination, and the fixation of this air explains the augmentation observed.

In 1777 Lavoisier completed his analysis of the air. Availing himself of the property possessed by mercury of oxidizing at a certain temperature and of losing its oxygen at a higher state, he was enabled by its aid to remove the greatest part of its oxygen from a determined volume of air. Having thus isolated the azotic gas, he heated the oxide of mercury produced, and collected the oxygen separately. In mingling again the two gases, he re-constituted the atmospheric air, the same in all its properties, and in volume equal to that which he had employed.

Lavoisier's hypothesis of heat is curious; but his conclusions are sometimes incompatible with experiments made by Sir Humphry Davy.

"He first proved that heat accumulated in bodies does not alter their weight; it should therefore be considered an imponderable fluid. This fluid presents itself under two forms—the free state, *i. e.* a state of continual movement, tending to put itself in equilibrium in those bodies which are near that which contains it; but sometimes it is combined and in repose. When it is free, its presence is discovered by its action on the thermometer; but when it is combined, the thermometer is insensible to its action. Proceeding upon this, he ascertained that when a body is transformed into vapour, it absorbs a great degree of heat; as water, alcohol, and ether. He discovered that when the evaporation is most rapid, the absorption is most manifest. Thus vapours are liquid or solid bodies transformed into gas or elastic fluids, by imbibing a great quantity of heat. He wished decisively to enforce, that vapour is absolutely of the same nature as gas. To demonstrate this identity, he devised some ingenious processes. For example, that by means of a tub filled with water, he could obtain ether under the form of gas, and that for this it sufficed that the water was kept at a temperature of 40° (Centigrade.) Consequently, if ether is not gaseous at Paris, for example, it is because the temperature is a little too low, and the pressure a little too great. But ether would become a true gas upon the elevated planes of South America. 'What effect then would be produced upon the different substances of which our globe is composed, if the temperature were suddenly changed?' asks Lavoisier. 'Let the earth be transported suddenly into a hotter region in the solar system,' he observes, and soon the water, the analogous fluids, and even mercury itself, would gradually expand, and be transformed into aeriform fluids or gas, which would become part of the atmosphere. The new kinds of air mingling with others already existing, the result would be new decompositions and combinations, until, the

new affinities having been neutralized, the principles of these different gases would arrive at a state of equilibrium or of repose.' Thus, in Lavoisier's opinion, vapour is gas or somewhat analogous; and in pursuing these results, he was led to conclude that the gases themselves were originally liquid or solid bodies, reduced to vapour; bodies which, by their combination with caloric, have taken the gaseous form.

"Also in combining oxygen gas with some body which renders it solid, the oxygen gas loses the heat which, at first combined with it, kept it in a gaseous state; and this heat which is lost and dissipated gives rise to the phenomena of combustion.

"Solid bodies then are gases deprived of a part of their heat; and Lavoisier did not fail to draw from it a conclusion which he opposes to the preceding.

"If the earth were suddenly transported into a region very cold, the water which forms our rivers and our seas, and the greater number of the fluids with which we are acquainted, would be transformed into solid mountains, into very hard rocks, at first diaphanous, homogeneous, and white as crystal; but which, in the course of time, mixing with substances of different natures, would become opaque stones diversely coloured. The air, under this supposition, or at least a part of the gases which compose it, losing their elasticity, would be reduced to a liquid state; thus producing new liquids of which we have not the slightest idea.' "

We have given this long extract partly to draw attention and pay our humble tribute of praise to the labours of Dr. Faraday, who has verified some of these suppositions in his experiments on the condensation of the gases.

Lavoisier, according to M. Dumas, laid the crowning-stone of his fame by establishing the composition of water; but we cannot consent to this proposition, inasmuch as our own Cavendish had previously demonstrated the fact; and the component parts were only finally settled by M. Gay-Lussac.

But we have reserved the catastrophe.—The bloody tide of revolution engulfed even this votary of science. In 1794 an act of accusation was passed in the convention against all the farmers-general. Lavoisier was included. The revolutionary tribunal were not wont to make exceptions. They saw in Lavoisier only the obnoxious officer, and they doomed him to the fate of his colleagues. We subjoin the judgment passed on a man who not only had shed such lustre on the sciences, but in his political life had displayed the most unbounded love to his country. He was "condemned to death, convicted as the author or accomplice of a plot against the French people to favour the success of the enemies of France; especially in imposing all kinds of exactions and griev-

ances upon the French people, and in mixing water and deleterious ingredients with the tobacco, injurious to the health of the citizens who use it."

The subsequent progress of chemistry cannot be contemplated without astonishment. Its advancement was greatly facilitated by the reform effected in chemical nomenclature. Guyton de Morveau, in 1782, first drew attention to the necessity of this, and the new system was finally perfected by the joint labours of Morveau, Fourcroy, Lavoisier, and Berthollet. The terms of the alchemists were abolished, and others, founded upon the nature of compound bodies and the leading qualities of elementary substances, introduced. The confusion which had previously prevailed was extreme. The same body had often a great number of names; and the terms in use rested for the greater part on the most distant analogies. "Thus, they said—*oil* of vitriol, *butter* of antimony, *liver* of sulphur, *cream* of tartar, *sugar* of lead; chemists seemed to have borrowed the language of cooks."

The reformed language was introduced in 1787; and though the progressive character of chemistry has rendered necessary some modifications, for which we are principally indebted to Sir Humphry Davy, it has been made to answer the wants of the modern science. The study of chemistry now contained nothing repulsive to the most fastidious; and its importance in explaining the phenomena of nature drew towards it the attention of the most cultivated minds.

Foremost of discoverers in the history of modern chemistry may be placed our own countryman Dalton, whose *Atomic Theory*, as it is, perhaps not very appropriately, called, has led to a complete revolution in the science. But we must not forget the researches of his predecessors which prompted him to this theory. So early as 1777, Wentzel observed that there are several saline solutions which, when mixed with others, completely decompose each other, so that two new salts are produced. This fact was afterwards noticed by Richter, but did not attract particular attention. Adopting the doctrine of definite proportions, hinted at by Higgins, Dalton was led to speculate on the ultimate elements of bodies; and having demonstrated that a volume of carburetted hydrogen gas and one of olefant gas contain the same weight of hydrogen, but that the weight of carbon in the latter gas is just double that in the former, this led him to attend to the nature of these elements; and he concluded that they consisted of *atoms* incapable of further diminution or division. He considered it then demonstrated that carburetted hydrogen is a

compound of one atom hydrogen and one atom carbon; he inferred that the ultimate particles of all homogeneous bodies are perfectly alike in weight, figure, &c. In other words, every particle of water is like every other particle of water; every particle of hydrogen is like every other particle of hydrogen, &c.;—that moreover, these particles, falling into juxtaposition in definite proportions, form compounds, and take, at the moment of their separation, all their first properties.

When this "New System of Chemical Philosophy" was first made known, the conflict of opinions was overwhelming. Several chemists, Sir Humphry Davy among the rest, refused to admit it; and others affected to treat it with contempt. No one indeed doubted that a compound presenting invariably the same character and properties consists of the same constituent parts; but many thought that the theory would impede research by accommodating the results of analysis to its deductions.

The first direct proof of the accuracy of the theory was adduced by Dr. Wollaston, who showed the existence of three salts composed of oxalic acid and potash, the oxalate, binoxalate, and quateroxalate.

The subsequent experiments of Dr. Wollaston, Dr. Thompson, Sir H. Davy, (who was soon converted to the doctrine), Gay-Lussac, and above all Berzelius, have elucidated and rendered this theory, in the opinion of most persons, almost certain. But though universally adopted at home, it is not so on the continent.

M. Dumas proceeds to consider Wollaston's opinions on the infinite divisibility of matter; but he will not admit that either the phenomena of chemical equivalents, or the phenomena of the heavenly bodies, demonstrate the existence of atoms.

"We know that the air is a body, that it dilates in proportion as it recedes from our earth, and we may reason thus: if the matter of the air is formed of atoms, they would experience a considerable separation, but limited; at a certain distance from the earth, an equilibrium would be established between the earth and the most distant atoms, and the atmosphere could not be extended indefinitely.

"If, on the contrary, the matter of the air is divisible to infinity, it would spread throughout space, and condense itself round other worlds, at least those of our system, as it does round the earth.

"Then the moon would have an atmosphere. Now we know that the mass of the earth is much more considerable than that of the moon. We can conceive then, that in order to render the air of our atmosphere in

the same state in which it would be at the surface of the moon, it must be carried to a considerable distance from the centre of our globe. If you make the calculation, you find that the mass of the moon could only condense at its surface an atmosphere equal in density to that which would exist at about 2,000 leagues from the earth."

Observations made by Vidal, Wollaston, and Kater, justify the conclusion that the sun has no atmosphere.

"All contest then is impossible. Our atmosphere does not expand indefinitely into space; it is arrested at a certain limit.

"Wollaston considers it proved that the matter which constitutes the air cannot be infinitely divided."

We may observe that before the Trojan war the Phœnician Moschus suggested the idea of those particles. M. Dumas says—

"The first notion of atoms dates about 510 years before the Christian era. About this period was formed at Elea, in Greece, a school of philosophy, well known by the name of the Eleatic school. They reasoned thus. Matter exists; every thing which exists is matter. Annihilate matter, what would remain? Who can imagine?—There would be *nothing*, you say, a vacuum, space. Then *nothing* would exist. Now if *nothing* exists, it is a being, it is matter, and matter cannot have been destroyed. *Nothing* then does not exist. But if *nothing* exists not, matter is every where, *there is no vacuum*.

Leucippus opposed this school, and deeming the evidence of his senses of some weight, endeavoured to prove the existence of a vacuum. But in combating this doctrine it must be acknowledged that he employed singular arguments, and that his experiments are worthy of notice, as exhibiting a curious contrast between their utter want of precision, and the extreme importance of the conclusions he drew from them.

"Thus he maintained that a vessel full of cinders would contain as much water as an empty one.

"In a word, movement, the existence of which could not be contested, furnished him with unanswerable arguments.

"Leucippus regarded matter as a sponge, the isolated grains of which swim in vacuum. These grains are solid, impenetrable, infinitely small. All known bodies are thus formed of vacuum and plenum. With the material element or plenum, with vacuum, and movement, Leucippus constituted the world. The grains which compose it differ in figure, which explains the differences we observe in the various kinds of matter. Moreover, he admitted, that by varying only their order and disposition, these material elements produce bodies totally different. This is in some measure the isomerism of modern chemists. In short, he takes notice of the compo-

sition and decomposition of bodies, and he admits that bodies composed of the aggregation of material particles are destroyed by the separation of these same particles."

Democritus went farther than Leucippus; he maintained that matter is not divisible to infinity.

"If matter could be divided to infinity," said he, "we should arrive at particles without magnitude: particles without magnitude could not produce bodies possessed of magnitude; matter then can only divide itself into limited particles which have magnitude. These particles he called *atoms*, and it was Democritus who invented this word, now so often employed in chemistry."

Epicurus added a third property—gravity—to the two attributes admitted before him—figure and magnitude.

"One of the writings in which this philosopher has unfolded his ideas with more detail had long remained lost, but was found in the ruins of Herculaneum.

"This work formed the basis of the famous poem of Lucretius, in which we find the ideas of Epicurus developed and embellished. Lucretius admits vacuum, atoms, and movement. The atoms, in perpetual agitation, are precipitated in the vacuum. But their fall is not exactly perpendicular; it presents a slight and variable declension, which plays an important part in the cosmogony of Lucretius. With the atoms which float in space, with a movement which impels them, with a fortuitous or side motion which makes them fall obliquely, Lucretius builds the entire world, in all its details. Thus all creation is formed by chance."

These notions, like the other vagaries of the Epicurean philosophy, were little considered till the controversy between Descartes and Gassendi forced them into notice.

"Descartes wished to renew the romance of nature *more antiquo*. Regarding magnitude as divisible to infinity, and applying to matter the same principle, he denied the existence of atoms, and built his system without admitting them. Gassendi, on the contrary, composed the universe of atoms. But these do not even touch. Kept at a distance by the forces which governed them, spaces are left between, and their mass presents but little solidity. Thus Gassendi has closely approached the ideas of the present day."

Unpalatable as the philosophic world found some parts of the doctrine of Gassendi—his round atoms forming light, those constituting cold, heat, smells, tastes, and even sound—Wolf dished up something more indigestible still, but under another name. His system was gravely discussed in the acad-

my of Berlin, and in 1746 a prize was proposed for the best dissertation on *monades*; but the issue of the discussion was unfavourable to the *monadist*.

"With Wolf every thing is monade. God is a monade. We are monades, as are also our ideas. Monades press before us in space, they become obscure; then we have no clear ideas. But they separate, they brighten; light beams on our senses, and our conceptions become just and precise."

Next came Swedenborg, who admitted in atoms a form generally spherical; but he conceived them to be associated so as to form small, diversely figured masses. "It is then to him we are indebted," says M. Dumas, "for the first idea of making cubes, tetraedres, pyramids, and the different crystalline forms, by grouping the spheres; and it is an idea which has since been renewed by several distinguished men, Wollaston in particular." But the two systems differ essentially.

In the year 1809 M. Gay-Lussac published in the *Mémoires d'Arcueil*, a paper on the union of the gaseous bodies with each other, the object of which apparently was to confirm and establish the atomic theory, by exhibiting it in another point of view. In this paper he endeavoured to show that the gases unite with each other in extremely simple proportions, one volume of one gas either combining with one volume of another, or with two volumes, or with half a volume. He had already established, with M. de Humboldt, the composition of water—which is formed by the union of one volume of oxygen with two volumes of hydrogen gas. He now ascertained by experiment the composition of the ammoniacal salts, of the oxide of azote, of ammonia, of sulphuric acid, carbonic acid, and of the oxide of carbon. Thus M. Gay-Lussac regarded gases as formed of atoms which combine in definite proportions, as Dalton maintained to be the case with bodies in general.

M. Dumas states,—

"My conviction is, that the equivalents of chemists, those of Wenzel, of Mitscherlich, those which we call *atoms*, are nothing more than molecular groups. If I had the power, I would expunge the word *atom* from the vocabulary of the science, fully persuaded that it goes farther than experiment; and never in chemistry should we go farther than experiment."

We now revert to the question of the origin of Chemistry. Though in this general outline we have thus far accompanied M. Dumas, we must pause for a moment to notice with disapprobation his peremptory, but superficial remarks upon some portions of

the subject historically, and which by men of far greater learning and research than obviously fall to the author's share, were, and are, held worth consideration. The sneer of a lecturer may pass unscanned, and in safe superiority among his disciples, but when published to the world at large, the triumph is by no means so secure. The Fathers of the Church, to whom M. Dumas has sarcastically alluded, were men whose minds could afford to become the objects of his wit, and might have repaid his scorn with interest. They wrote from that which was before them; and as many of the works to which they had access have long since unfortunately perished, reason would counsel us to receive with attention and closely examine the fragments of the past contained in their pages alone, and carefully to collate them with such other notices as we possess, before we presume to attribute to them an ignorance that not impossibly, nor even improbably, rests with ourselves. To an attempt of this kind we feel ourselves imperatively called by some of the preceding passages in this article, however inefficient to the task.

The venerable authorities referred to have preserved a tradition that the book Kema was given by the Egregori to the Daughters of men; and as the fact here alluded to is evidently the same with that mentioned in the 6th chapter of Genesis, verses 2 and 4, we shall proceed to inquire if a collation of the circumstances can throw any light upon the origin of Chemistry, and, incidentally, even upon that confessedly obscure portion of Holy Writ.

The passage in question, v. 2, c. 6, of Genesis, affirms that the Sons of God, or Beni-Alohim, saw the Daughters of men, or Benoth-Adam, "and took them wives of all they chose" of the latter. The Jews from early time, and commentators constantly, have supposed that by the Sons of God, angels were necessarily intended. This interpretation, though generally received, is, as generally admitted by scholars, open to question.

It is allowed on all hands that the word Alohim, usually rendered *God*, or *of God*, as in the above instance, is also, and with equal correctness, to be understood simply of Might or Power; of which word indeed it is only the plural form; and in fact often understood by preference in this latter sense: as the wind of God, i. e. a mighty wind; the cedars of God, i. e. mighty cedars, &c.: precisely the same form of expression is preserved in the Arabic also to the present day, and as indicative of any quality in excess. By analogy, therefore, in the passage

we are considering, it would signify **Might**, or the **SONS OF THE MIGHTY**. Who are these?

The language of the passage distinctly marks, and in terms that cannot be mistaken, the practice of polygamy thus freely established. And whence did it originate? There can be no question as to this; since, so far as we are informed, it was adopted by Lamech in the first instance; not improbably from espousing the wife of the man he had slain, as appears from the Chaldean paraphrast, in self-defence: (see F. Q. R. No. 35.) Lamech was the descendant of Cain.

Cain the husbandman, עֵינֵר, *agor*, (Latin *AGER*, a field :) was denounced as a fugitive, עָרַב, and wanderer, גִּירָה, *gori*, from his parents, and his posterity remained separated, as the word *niphilim* implies, the apostates, giants, or **MIGHTY**;—and they are no longer referred to by the sacred historian as the Children of Adam. The genealogy of these occupies the 5th chapter of Genesis; i. e. we submit, the interval between the separation of the races, by the punishment of Cain, and their re-union by the licentiousness of his descendants with the Benoth-Adam; Daughters, not of *Men*, as translated, but of **ADAM**, as in the original text.

Independent of the probability that the polygamy of Lamech should have been adopted and carried to excess by his vicious descendants, and not by angels, the name preserved, Egregori, countenances this hypothesis; and, since its preservation was never contemplated in connection with the sacred text, confirms it, we think, both incidentally and absolutely.

The Egregori of Chemical History are obviously and undeniably the עֵינֵר-גִּירָה, *agri-gori*, or Husbandmen-wanderers of Hebrew Scripture, the race whose skill in metallurgy and science is so distinctly marked by the names of Jubal and Tubal-Cain—and so fairly presumable farther by the fact that their first ancestor, Cain, was the founder of the first city.

We would further observe that the first fugitive is described as fleeing from vengeance to the land eastward of Eden—and, wherever we place this, it was to Persian ground. The two ancient languages of Persia, however corrupted, bear out the same sense as the Hebrew, and by a slightly different and derivative etymology, owing probably to their later corruption. *Eghre* or *Aghre*, in Zend and Pehlivi respectively, signify mighty, or prone to evil; the Cainides were undoubtedly both; and *Khero*, *Khor*, signifying *crime* in the same tongues, seems allied to the Sanscrit *Ghur*, to oppress or harass.

Thus, then, the fugitive husbandmen of the Hebrew code were the mighty sinners and oppressors of the land where they flourished; and their improvements in art are given on such unquestionable authority that we see no reason to doubt the tradition that they brought the first elements of science to the general knowledge of mankind. In this case, and only in this, can we account for the traditional preservation of the name Eggegori, which collaterally forms the link wanted in the chain of evidence.

The two heathen traditions of this confluence of races have gone to the two extremes of exaggeration. Truth might lie between. The Arabs, following the rabbinical tradition, have formed two Giant Angels; while the Persians have degraded them to Demons, or Deevs, (mighty, sage, powerful,) who offered violence to the Peeris, daughters of light or purity; (*peor*;) i. e. to the daughters of the pure race, the children of Adam and Seth. Both Deev and Peeri, too, suffered under Divine wrath.

By this explanation—and the coincidences, if of no value, are the more remarkable,—the obscurity of the antediluvian history disappears, and the parts stand in confessed relation to each other. Let us even admit that the only parallel phrase, that in Job, of “the Sons of God,” signifies Angels there, yet it would be no authority for the former case; since, as we have seen, the word is freely translated both ways in various instances.

On the subject of writing we may notice, as a matter of curiosity if not of importance, that traditions of both the nations referred to attribute writing to Enoch, though the Arabs confound him with the son of Seth. To the Apocryphal book of this prophet we need not allude: but with reference to the alleged book of Kema, or mysteries, it is singular that the same word, *kor* or *gor*, כּוּר, signifies not only mighty, or leaders, Chald. כּוּר, but also, written, graved; as in rock: exscidit, כּוּר, *koreth*, and effodit, כּוּר, *khor*; and כּוּר, *koreth*, is the pen, or instrument of writing, in Hebrew; while this root appears in the Zend form *ma-gor-ta*, a book; i. e. many letters; Hebrew כּוּרָא, *ma-kora*, reading.*

* The specimens here given incontestably prove that homophonous letters did not necessarily alter the sense in early times; nor probably before the Captivity. Even now, scarcely two writers, still less speakers, agree in the *e*, *h*, *hh*, *ch*, *tch*, *g*, *k*, *kh*, *q*; of the Hebrew especially; as the grammars show.

See also F. Q. R., No. 39, for the Aleph and Oin, &c., interchanged in the Cuneiform Inscriptions of Persepolis. In No. 35, we have marked the interchangeability of every letter

Could the Korybantes, with their columns of inscribed ceremonials, bear reference to the same double root, *Kori*, the Wanderers, or the Lettered, and *phantes*, priests? Their original residence, too, was supposed to be Phrygia, and their especial pursuits astronomy and metallurgy.

The Hermesians also affirmed that the *Koords* were among the earliest possessors of the arts of agriculture and reading, and preserved a tradition of their descent from the children of Adam.

The same double root is preserved in the Arabic name of Koran, the (book) *to be read*, from the Arabic, (and Hebrew,) *Karâ*, to read; and that of the *Koreish*, (כוּרִישׁ) the pre-eminent tribe, who largely retained the oldest Zendo-Persian superstitions.

From all these coincidences, too numerous perhaps to be altogether accidental, we may fairly ask whether the race that first introduced settled habitations and music, the arts of life and the science of metals, could yet have been so ignorant of that science as to render the assertion of their possessing it ridiculous? Could the descendants of Tubal-Cain have used the forge for metallic operations, and yet have been ignorant of all the results of combination? Or without laying any stress upon the philological coincidences we have put together, is it in the least extravagant to imagine that the art of writing first occurred to the first cultivated race of mankind, the children, as Holy Writ proves, of Cain?

Nevertheless, we are bound to observe that the chain we have adduced of philological facts tends to bear out the universal voice of tradition, and the positive affirmations of the Hermetics and Chaldeans, that writing was an antediluvian art.

It is only, we submit, from the serious doubt and confusion entailed by the two slight misunderstandings, for they cannot be called mistranslations, of the Hebrew text which we have pointed out, that so strong a reluctance has been everywhere felt to admit the historical value of the antediluvian narrative. With Noah and his family for the connecting link, can we doubt that the arts of the former period were preserved, and their memory retained, though in tradition alone? This, too, simply because those arts were not connected with the religious scheme of the Mosaic dispensation.

But why, we would fain inquire, should

of the alphabet from above thirty languages, and could easily multiply the proofs through three times that number.

Modern sagacity alone has established the incorruptibility of radicals of every kind.

M. Dumas indulge in a sneer at the knowledge of the Hebrews? Moses was skilled in all the science of Egypt; and that this, whether original, or derived from, or shared by other nations, was great, no one can pretend to deny. The astronomical science that built the pyramids could not have been the work of a day, but must have descended improving, and therefore must have been preserved by characters; so also the book of priestly names which Herodotus heard read. The Pentateuch establishes the fact that Moses was skilled in science in general: we instance, the outlines of natural history, the laws and observances for health; and these develop a knowledge of anti-septics, and even, though shrouded by religious forms, a process of obtaining potash by combustion. The Arabs indeed, and Segued Ben Musib in particular, distinctly affirm from tradition his acquaintance with chemistry, rude as it might have been, and his communicating a portion of this knowledge to his successor, Joshua. His scientific terms, as noticed by Prosser* among others, are singularly correct; the short treatise on the same subject by the late Arthur Lumley Davids, contains ampler evidence of the fact; and a profounder intimacy of the Hebrews with mensuration than the moderns, until very lately, can boast, is established without a possibility of question by the researches of Captain Jervis, who has demonstrated the correct measurement and perfect concord of the two passages respecting the Brazen Sea in Solomon's time, so constantly ridiculed by the learning of even the last century: a fact, we believe, little known, but assuredly one of the most astounding of recent discoveries.

It would be singular too to deny chemistry to the Hebrews while the words that express its first and obvious requisites are absolutely the very formatives of their language. The etymology of כֶּמֶס, Hebrew and Chaldaic, is, object; mode of development: i. e. SCIENCE. Strictly from the formatives, כֶּמֶס, Power in operation.

The derivation of the word Alchemy in Webster's Dictionary is given as the Arabic article *Al*, and *Kimia*, hidden; from *Kamai*, to hide. The Arabic and the Greek word are, however, in all probability differently derived from the same root, above shown: opposite extremes being frequently expressed by the same word, in Eastern languages especially; in this case, the *development* would imply something *concealed*.

The presumptive evidence of derivation in both the cases cited above, instead of favouring, is, in fact, decidedly against the Arabs, the Greeks, and the vulgar opinion. The term *Ombic* certainly existed in the East long before Geber or Dioscorides: into the works of the latter it may, *by possibility*, have been interpolated, with so very much besides, but it is scarcely doubtful that he borrowed it from Asia. The components of the word show indeed its exact nature; not, *Mixed in one vessel*; as commonly supposed, but, and far better; *Forming by gradual Exhaustion*: i. e. distillation; another instance is in the word Crucible or Cucurbit, by its formatives denoting a furnace-pan.

The conjectures are doubtless partially correct that identify the early name of Egypt with the term, Chemistry; the common root of both referring variously to the *Action of Heat*, deemed the Universal Agent in oldest Eastern Philosophy; though a difference might be made between Cham, the arid heat, and כֶּמֶס, *kema*, the genial and fertilizing warmth.

After recent discoveries and the elaborate volumes of Wilkinson we little need to dwell upon this portion of the subject; embalming was known to Egypt in the days of Jacob and Joseph; and bronze and the mystery of the Hermetic *mummeya* are proofs of chemical combination rivalling and exceeding modern skill, and could not have been acquired at once. Their green, too, like ours, was the sole perishable colour.

Laertius affirms that the Egyptians were preceded by the Chaldean sages, whose name Kartumim has been variously derived from astrology, writing, and wisdom, in an era when the three were probably synonymous; and when certainly, as we have noticed, the labours of the first-named science necessitated the use of characters. The same authority affirms, but more suspiciously, that the Magi were indebted for their learning to Chaldea. When we examine historically the facts left by them, few and indistinct as they appear in the ignorant hands of their poetical condenser, Ferdousi, and find the working of gold and silver, the formation of armour by the furnace, with a considerable knowledge of botany and distillation in that remote age, we are scarcely tempted to doubt their degree of skill displayed in times scarcely less remote, and beyond all historical relation, in the mines of the Ural and Altai by the Tchudes, as Ehrenberg's recent travels give evidence; (See too F. Q. R. No. 40,) where the time out of mind *traditions* of the Chinese and Tatars have been fully verified by the

* Prosser's "Key to the Hebrew Scriptures," explaining every word in the sacred text. A little volume which we can freely recommend to students of the language.

facts discovered, of works scarcely credible did not their remains exist. We would ask too, whether the preternatural skill attributed respectively, and with recorded, and often exaggerated facts, to the Egyptian magicians and the Chaldeans in the Scriptures; to the Magi of Persia and the Deevs in the Shah-nameh of the former, the Mahabharata, Harivansa, and Ramayuna of Hindostan; to the enchanters of the African Dom-daniel, the witches of Thessaly, the Tatar sprites, and the mighty dwarfs of Scandinavia; and even if the Chinese gunpowder and loadstone, do not all more or less evidence a skill in natural magic far beyond the general enlightenment of mankind in any age, and a knowledge of properties and powers of nature that could only have proceeded from chemical and other sciences? The wonder-workers of Egypt, the jugglers of China and Hindostan have from unknown ages to the present day defied the more regular progress of European inquiry; the flexible gold even of our own times, the steel furnished to Alexander by the Indians, [see their process in Mr. Heath's paper in the *Athenæum*, 1839, p. 172, together with the opinions of Mr. Brande, *Lit. Gazette*, 1839, p. 155, on the steel of the Egyptians,*] established a chemical skill which it would be idle to question or defend.

The Nabatheans are often confounded with the Chaldean sages, but their existence is demonstrable by the Hebrew Scriptures shortly after the time of Moses. Occupying the northern and western parts of Arabia, claiming the priesthood and even sovereignty of the oldest Egypt, their mystic books contained and concealed the treasures of early science for their Arabian descendants, for whose use 1000 years ago, under the Caliphate of Ben Mervan, some of them were translated by the Nabatheans,, Aben Vahashih, &c. The Worship, the Agriculture, the Astrology, the Laws, the Customs, Ceremonies and Sacrificial Offerings of this Hermesian race, recorded by Maimonides, have all to the best of our knowledge, in their entirety unfortunately perished, with all their possible information and monstrous and impossible chimeras; but the wreck still remaining allows us to identify the antiquity of the existence and superstitions of their race, the genuine ancestry of Arabian philosophy.

* "It was explained only by the lights of modern chemistry." * * "Yet there was little doubt that the tools used for forming the hieroglyphics on their obelisks and temples were of Indian steel."—*Heath's Speech before Royal Asiatic Society, Asiatic Journal*, pp. 248, 249.

Was not the Roman glass, noticed by Winckelman, Etruscan?

It will scarcely be questioned, we presume, that the Hermetic philosophers of Arabia, who, as the Nabatheans, extended from the confines of Egypt to the Persian gulf, united the lore and science of Persia, Syria, Arabia, and Egypt. In the scattered but indubitable traces left us of their existence we recognize art, ceremonials, superstitions, and usages, either borrowed from, lent to, or shared with the above-mentioned limitrophe countries, and in whose fading records they are yet, however imperfectly, preserved. When we recall the known tendency of eastern, and in fact of all ancient nations, to maintain the traditional customs of their ancestors; and bear in mind, on the other hand, the gradual progress of improvement which no pertinacity can ever entirely shut out, and the study of science so unremittingly pursued by the sages of old; we shall probably find little difficulty in admitting, not only the unquestionable existence of the Hermesians in Egypt and Arabia, but the identity of this race in the former land with the descendants of their Arabian brethren in later times. If also we compare the traditional reverence, preserved in both countries to this day, of the wonderful skill in the properties of nature and of the magic powers of their early philosophers, with the absolute coincidences of rites and institutions, already hinted at as found in the sacred and profane Oriental and classical writers, we shall scarcely, we trust, be deemed to draw too largely upon credibility when we affirm the impossibility of denying the claim of the latest Hermesians to the traditionary descent and knowledge of their asserted ancestors. As the particulars of this race are little known we shall offer a few details, such as time has spared, especially as being connected closely, if indirectly, with the general subject.

Dividing the sovereigns of Egypt into three classes, of which the Coptic princes were the third and the Pharaohs the second, as facts, confirm, the Nabatheans assume for themselves the first royal station in chronology, and specify among others their king, Kemas, who wrote on astronomy, physic, and the properties of plants and minerals. They claim the labours of the tombs and catacombs, the pyramids and temples, together with the cultivation of astrology and alchemy from the earliest times. In his valuable work on the modern Egyptians Mr. Lane, no ordinary observer, has justly remarked that in their addiction to alchemical pursuits "a considerable knowledge of chemistry is sometimes acquired;" and this assertion of scientific progress, undeniable now, must have been equally true of their

ancestors. Talismans, astrological tablets, secrets of nature and the heavens, magic fumigations, philtres, compounds; distillation, sublimation, solution, calcination and purifying; crucibles, boilings, alkalis; the trituration, solution, calcination, and composition of stones and gems; sulphur, brass, magnets, vitriol, salts, vegetable salts and waters, medical and poisonous plants and their oils, mandragora, &c. taken above a thousand years since from works confessedly obsolete, and in an almost forgotten language then, attest a knowledge fairly borne out by the relics of Egyptian skill so far as we otherwise possess them. The fact, too, that their terms have been always the terms of chemistry, is in their favour, conclusively.

They divided natural magic, or philosophy, into two parts—1st, the existing properties of animals, plants, metals, and minerals; and 2d, the construction of machinery. Both these were distinguished from supernatural magic, the powers and influences of the seven planets, the twelve constellations, &c. &c.; and though, as Von Hammer observes, there is much that is fanciful and extravagant, there is also much of the formal rudiments of knowledge unquestionably laid down in their writings.

The Hermesian priests were divided into four classes, which the general reader may like to compare with the details of Clemens and others. The first were direct descendants of Hermes, and intermarried with their own race alone. The second, of collateral descent, did the same, but were allowed the use of perfumes and the intercourse of their relations at the commencement of each season, and whenever the sun entered a fresh sign of the Zodiac. The former class enjoyed these relaxations but once a year, with Sol in Aries, and a single festival of twenty-eight days; while the festivals of the second class were periodical with the seasons and of seven days each.

Their children were presented by the mother to the priest of the temple, who prayed over and sprinkled the child with water from a golden cup. If it turned towards the threshold it was deemed accepted, placed in a coffin and covered with a green handkerchief (like the houris?) if a girl, or with a red one if a boy. The coffin was closed awhile, and the child's parents and relatives performed their devotions and hymns; the priest then, holding a triple staff, interrogated the young aspirant as to his birth, wishes, sacrifice, and secrecy in the name of the Supreme: the child's answers were written down; and next, opening the coffin and purifying it with fumigations, they sacrificed a

quadruped or bird; the blood of which was burnt, and the body wrapped up in linen and placed in a pot of earth in the sacrificial pit with secret rites. If the child ever spoke of this ceremony he was ejected speedily, but on some factitious pretence:—if an adult left them, he survived but three days.

At their great festivals seven bulls and seven rams were sacrificed to their seven Gods of the Planets, including the sun and moon; a proceeding which identifies them with the idolatrous ceremonials of Balak and Balaam, the son, or priest, of Beor, and fixes one, and that a very remote, point of their history.

At their sacrifices alluded to, every priest wore the dress of his class and read the holy books; after which they remained prostrate for an hour, and, on rising, the sacrificers successively delivered their divinations, all which were taken down by the priests and compared for a general result. These are considered precisely similar to, if not identical with, the Chaldean Chartumim, and their name, *na-habath*, seems indicative of continued attention, or study, into mysteries, though its original derivation is probably from *na* and *abba*—patriarch, chief, or lord; to which the prophetic office, נביא, *naba*, was attached, and the inspired flow of eloquence—נבואה. The Na-bathi, or sages, were then the *Vates*, in the double sense of this word, poet and prophet.

The third class of Hermesians admitted some strangers; and the fourth, still more freely intermixed, were peripatetics. These we suspect to have been the Sabæans, as “they first introduced the worship of stars and constellations;” probably as such, and not as intelligences: thus assimilating to the later Magians.

The Sabæans, at least of later times, were not in all likelihood the same as the Nabatheans, for their rites seem more numerous and corrupt so far as we have any means of judging, though most writers have confounded the two.

ART. III.—*Symbolik und Mythologie der alten Völker, besonders der Griechen.* (Symbols and Mythology of the Ancient Nations, especially the Greeks.) By Friedrich Creuzer. 5 vols. 8vo. Darmstadt.

THE work whose title we have prefixed is of so vast and varied a nature, and the researches on which it is based and the comparisons instituted so numerous, complicat-

ed, and important, that we cannot wonder at the high reputation it has obtained, abroad and at home; especially where, as in its native land, multiplicity of details and abundance of illustration are even more sought for than the conclusions they are intended to establish. Highly as we ourselves must necessarily value them also, and greatly as we must admire the learning employed in the task, we yet cannot but think that the amassing and arrangement of details is but the first and rudest form of proceeding. It is the undoubted preliminary to the rest; the collection of materials to be employed in the after labour: but we cannot but fear that these gigantic accumulations have injured even more than they have aided the cause of knowledge, by occupying the time of their authors in collecting statements rather than in digesting their consequences, and thus preventing learning and ingenuity from reaping the fruits of their own proper labours.

To these vast and useful displays of erudition and science we feel, as we have stated, every obligation: but if anything more is intended; if these treasured stores are, as we doubt not, brought forward to produce a yet unobtained and desirable result; if the garb worn by the genius of the past, however valuable in itself, is still more so as marking the outline of the form that bore it, it is not, we submit, by examining alone the breadth or composition of the garment, by fixing the eye on its eternal folds and the ceaseless and varied play of the drapery, much as these may assist, that we can trace with certainty the real mouldings of the figure beneath. We must, in fact, draw back from too close an inspection, forget the varieties of the several parts in the general effect, and lay down the observer's microscope and the anatomist's scalpel, if the entire, original man is to be comprehended by the open eye. In all writings it is easy to accumulate facts or opinions, but these beyond a certain point only harass the action and the judgment. The true art of all excellence is selection; the true difficulty is only to reject: in the multiplicity of views and labours we may obtain the reputation of learning; in the calm severity of discrimination alone can we ever hope to become really wise.

It is from inattention to this rule which, like every other truth, is freely admitted and never applied, that we ourselves must attribute the failure of our learned brethren of Germany, in their efforts to find the goal which they seek by so many paths at once. The maze of antiquity is for them indeed a labyrinth; and every apparent turn and

opening is sought and explored with an avidity that induces continual deviations from the one straight path of progressive discovery.

It is clearly impossible to give in our narrow limits anything like a fair view of M. Creuzer's labours beyond a slight enumeration of the contents. The ignorance and information of earliest times; the basis of a grammatical system; remarks on the various physical sources of symbols and mythoi, their various shapes, and the different forms of belief; with an historical view of the earlier and later periods of mythological symbols, constitute the six chapters of his first book. The second book examines the religion of the Egyptians, Indians, and Medo-Persians, in a chapter devoted to each, and, we need not say, developing extraordinary research.

The second volume inquires into the subject of the religion of Asia in the first and second periods, and that of Carthage; the origin of Grecian worship, Pelasgian and Samo-Thracian, including also notices of Homer, Hesiod, and the gods of Greece; and embraces the Etruscans and other nations of ancient Italy.

The third and fourth volumes contain the heroes and demons of Greece, the Bacchic mysteries, Pan, the Muses, Psyche, Ceres and Proserpine; and the Thesmophoria and the Eleusinia, with their immensity of detail: the work concludes with a general view of the pagan nations and creeds, particularly of the north, and a vast variety of other matter down to the Christian era.

We cannot, it is clear, do justice to this subject; and there is the less necessity for the attempt, since not only is the inquiry suited rather for the abstruse scholar than for the general readers of our pages, but also because the far more simple, clear, and concise volume of our own countryman, the late erudite scholar R. P. Knight, recently reprinted with much judgment in an extremely cheap form, supplies a somewhat similar though more narrow course of inquiry; and is, therefore, far more acceptable probably to the general taste: to this book we turn.

The same difficulty meets us at the threshold of both works; and we are fain to inquire whether it is not more probable that the confusion of early times is merely corruption of a previous simplicity, an ignorant and pardonable mistake of history for mythology, of men for demons and monsters, than of an originally refined and subtle system of abstract imaginings. Did, in fact, the imagination range before the objects of sense had time to affect it, and be-

fore obscurity had shrouded the recollections of the past? Did the ideas of man spring from the tangible objects before him, i. e. from perception? or did he commence with metaphysics before he had cognizance of actuality in its most obvious forms? Did he resort at once to imagery and fable to veil the opinions and facts he wished to hand down in his first rude traditions?

Yet such seems the general assumption.

It was remarked, though too boldly, by Newton in his *Egyptian Chronology*, that the concise tale of kings in Herodotus was much enlarged in the time of Diodorus the Sicilian, and received an immense accession of numbers in the later age of Manetho. The fair suspicion, which recent discoveries however have shown to be incorrect though certainly not in the sense supposed, may yet be applied, and with justice, to the religious system of Egypt. The priests, as we have formerly observed—No. XLII. p. 196,—could read the names of their 330 kings to Herodotus, yet could tell him nothing of those kings; so that beyond an imperfect writing and the existing monuments, the historical knowledge of Egypt was lost amongst those who were set apart to preserve it. And yet we have for 2000 years been believing, and are still expected to believe, that while absolute facts were irrecoverably lost, the finer dreams of mythological refinement, the allegorical customs, the types and shadows in which Egyptian wisdom, or folly, loved to veil its sense among the initiated, were all at once in after ages revealed in full light, and to the uninitiated alone!—that that veil of Isis which no mortal, even a native priest, had undrawn, was raised for the curiosity of the unbelieving Greeks; and that though the mysteries of Eleusis were unprofaned in the time of Horace—*vetabo qui Cereris sacra vulgârit*—the deeper silence of those more mysterious rites, whose meaning was whispered by the two higher orders of hierophants alone, was freely proclaimed in its original, unexaggerated state for the general ear, by the profane voices of Plutarch, Porphyry, and Macrobius!

It would indeed betray a salutary scepticism to inquire how this discovery, itself the greatest mystery perhaps of all, originated. Did the minor priests reveal the knowledge they had guarded so long; that entrusted to themselves alone? Or did they betray the secrets of the higher orders only?—and how came they by these? Or, and is it not more probable to suppose, did the strangers so freely admitted in later times to imperfect participation of the sacred rites, confuse the doctrines of their semi-informa-

tion, and leave to the Greek inquirers a mass of unshaped traditions and fanciful allegories, which the best aids of learning and genius could work out into no clearer shape than the wild and hopeless divarications presented in the pages of those later writers?

“It is extremely difficult,” Mr. Knight observes, “to obtain any accurate information concerning any of the mystic doctrines; all the early writers turning away from the mention of them with a sort of religious horror; and those of later times, who have pretended to explain them, being to be read with much caution; as their assertions are generally founded in conjecture, and oftentimes warped by prejudices in favour of their own particular systems and opinions in religion and philosophy.”—pp. 2, 3.

The union of art and mythology in ancient times has ever been so obvious, that each has been called upon, in every age, to assist in casting some light on the other; but it has been reserved especially for “these piping times of peace,” to carry out more thoroughly and effectually the measures which were likely to ensure success, while the mass of intellect which has been brought to the work, with the energetic power which has set that mass in motion, not only promises, but has already ensured, the most favourable results. Within our memory this branch of knowledge was the study of a chosen few, but now so widely has it spread as to form a subject of interest in general society. In the work now more immediately before us,* besides its ample learning, considerable talent has been displayed, not only in the general arrangement and treatment of the subject, but in a perspicuity of description as desirable to the reader as creditable to the author; while the text is substantiated by numerous extracts from ancient writers, contained in the notes, with continued references to coins and other works of art. In his opening section Mr. Knight states

“As all the most interesting and important subjects of ancient art are taken from the religious or poetical mythology of the times, a general analysis of the principles and progress of that mythology will afford a more complete as well as more concise explanation of particular monuments than can be conveyed in separate dissertations annexed to each.”

He then refers to the primitive religion of the Greeks, as being similar to that of all other nations not enlightened by revelation; most justly asserting, in Sect. 5, p. 2, that

* *Inquiry into the Symbolical Language of Ancient Art and Mythology*, by R. P. Knight. Privately printed 1818, and reprinted, London, 1836.

we find traces of the same simple "principles and fanciful superstructures from the shores of the Baltic to the banks of the Ganges." He next proceeds to say

"There can be little doubt that the voluminous poetical cosmogonies still extant among the Hindoos, and the fragments preserved of those of the Scandinavians, may afford us very competent ideas of the style and subjects of those ponderous compilations in verse, which constituted the mystic lore of the ancient priests of Persia, Germany, Spain, Gaul, and Britain; and which in the two latter countries were so extensive that the education of a Druid sometimes required twenty years. From the specimens above mentioned we may, nevertheless, easily console ourselves for the loss of all of them as poetical compositions, whatever might have been their value in other respects."

Is this last paragraph true, and have we not cause to regret them considering them only as poetical compositions? The question we conceive may be fairly asked; nor can we imagine how to answer it, without the means of judging.

We are next introduced to the "secret or mystic system," and reminded of the difficulties attending initiation, on which occur the following remarks.

"When Greece lost her liberty, the periods of probation were dispensed with in favour of her acknowledged sovereigns; but nevertheless so sacred and awful was this subject, that, even in the lowest stage of her servitude and depression, the Emperor Nero did not dare to compel the priests to initiate him, on account of the murder of his mother. To divulge any thing thus learnt was everywhere considered as the extreme of wickedness and impiety, and at Athens was punished with death; on which account Alcibiades was condemned, together with many other illustrious citizens, whose loss contributed greatly to the ruin of that republic and the subversion of its empire."

We greatly question whether it was so much "the sacredness and awfulness" of the subject as the complete mastery of the priests over the minds of *all classes* by the management of their extensive means, which was proved by Nero's "not daring to compel the priests to initiate him." By laying bare the slender basis of their mysticism, the "vulgar religion or popular mythology" would have received a blow, which, at the time when the mild and humane tenets of Christianity were disseminated, there was every reason for averting at any hazard. That the priests even in those late days did possess such power cannot be questioned, while the feelings of the people at an earlier period may be proved by the fact, well

known and recorded, of Æschylus narrowly escaping being torn to pieces on the stage for bringing out something supposed to be mystic, and saving himself by proving that he had never been initiated. As in the Jewish dispensation, dark shadowings forth of things to come formed no slight part of their laws and ceremonies, so, to the uninitiated of the heathens, symbolical language formed a veil at which men might gaze and wonder; while in many of its details it bore an evident impress of portions of our belief. The following observations are just and to the purpose.

"In examining these symbols in the remains of ancient art, which have escaped the barbarism and bigotry of the middle ages, we may sometimes find it difficult to distinguish between those compositions which are mere efforts of taste and fancy, and those which were emblems of what were thought divine truths; but nevertheless this difficulty is not so great as it at first view appears to be; for there is such an obvious analogy and connection between the different emblematical monuments, not only of the same, but of different and remote countries, that, when properly arranged and brought under one point of view, they in a great degree explain themselves by mutually explaining each other. There is one class too, the most numerous and important of all, which must have been designed and executed under the sanction of public authority; and therefore, whatever meaning they contain, must have been the meaning of nations, and not the caprice of individuals.

"This is the class of coins, the devices upon which were always held so strictly sacred, that the most proud and powerful monarchs never ventured to put their portraits upon them, until the practice of deifying sovereigns enrolled them among the gods. Neither the kings of Persia, Macedonia, or Epirus, nor even the tyrants of Sicily ever took this liberty; the first portraits that we find upon money being those of Egyptian and Syrian dynasties of Macedonian princes, whom the flattery of their subjects had raised to divine honours. The artists had indeed before found a way of gratifying the vanity of their patrons without offending their piety, which was by mixing their features with those of the Deity whose image was to be impressed; an artifice which seems to have been practised in the coins of several of the Macedonian kings, previous to the custom of putting their portraits upon them.

"It is in a great degree owing to the sanctity of the devices that such numbers of very ancient coins have been preserved fresh and entire; for it was owing to this that they were put into tombs, with vases and other sacred symbols, and not, as Lucian has ludicrously supposed, that the dead might have the means of paying for

their passage over the Styx: the whole fiction of Charon and his boat being of late date, and posterior to many tombs in which coins have been found.”—pp. 3, 4.

Although the fiction of Charon and his boat may have been posterior to many tombs containing money, the boat was used for the Egyptian dead; and is it not certain that Charon himself was a fiction of the older Etruscans? His hideous features, unclassical and supposed unearthly visage, so represented also in Etruscan tombs, affording the same singular facial angle and formation of skull as are found in Mexican pictures and the tombs of Peru, as well as in some Egyptian mummies; one of these is in the British Museum, though by our sages *purposely* concealed from view! The importance Mr. Knight attaches to the assistance derivable from coins may be gathered from the following.

Sect. 17. “By opening the tombs, which the ancients held sacred, and exploring the foundations of ruined cities where money was concealed, modern cabinets have been enriched with more complete series of coins than could have been collected in any period of antiquity: we can thus bring under one point of view the whole progress of the art from its infancy to its decline, and compare the various religious symbols which have been employed in ages and countries remote from each other. These symbols have the great advantage over those preserved in other branches of sculpture that they have never been mutilated or restored; and also that they exhibit two compositions together, one on each side of the coin, which mutually serve to explain each other, and thus enable us to read the symbolical or mystical writing with more certainty than we are enabled to do in any other monuments. It is principally, therefore, under their guidance, that we shall endeavour to explore the vast and confused labyrinths of poetical and allegorical fable; and to separate as accurately as we can the theology from the mythology of the ancients: by which means alone we can obtain a competent knowledge of the mystic, or, as it was otherwise called, the Orphic faith, and explain the general style and language of symbolical art in which it was conveyed.”

Having thus explained his intention, our author commences with Ceres and Bacchus, called in Egypt Isis and Osiris, and in Syria Venus and Adonis, as those under whom persons were generally instructed in the faith. The Egg, with the Serpent, the Bull, and the Goat, are successively brought under notice, as symbolical representations of the active, pervading, and creative power of Divinity; and the passively productive principle is asserted to have been enigmatically

shown by the fig-leaf, the concha Veneris, the barley-corn, and the letter Delta. The Amazons of course receive their share of doubt, whilst a supposition of the origin of such fables is hazarded in the statement of Hippocrates, “that the right breast of the Sarmatian women was destroyed in their infancy to qualify them for war, in which they served on horseback; and none was qualified to be a wife until she had slain three enemies.”—(See also F. Q. R. No. xxxvii., p. 118.) Mr. Knight has previously mentioned that

“In the great sculptured caverns of the island of Elephanta, near Bombay, there is a figure, evidently symbolical, with a large prominent female breast on the left side and none on the right. This figure has four arms; and of those on the right side, one holds up a serpent, and the other rests upon the head of a bull; while of those on the left, one holds up a small buckler, and the other something which cannot be ascertained.”—p. 15, § 50.

In this emblematical figure our author considers the artist to have intended the union of the two sexes.

An idea of Mr. Knight (last part 54th Sect.) that “much of the Hindoo mythology and all their knowledge of alphabetical writing, as well as the use of money, came from the Greeks, through the Bactrian and Parthian empires, the sovereigns of both which appear to have employed the Grecian letters and language in all their public acts,” is out of the question.

Can indeed the *Aum* of the Indians, equivalent with the *Amun* of the Egyptians, have by any possibility been derived from the *Pan* of the Greeks? Does not the argument tend the opposite way, and bring much from India which has been supposed *given* to it? We refer the reader to F. Q. R. No. XLIII. Art. *Schlegel*, pp. 93—98. Also No. xxxv., p. 66, and No. xxxvii., p. 107.

The Etruscan tombs, we now see, to a certain extent contradict the latter part of the 86th section. What would the author moreover say to the cities of the plain? Surely the account in the 19th chap. Genesis is enough to determine that “such preposterous appetites were” not “wholly unknown to the *simplicity* of the early times,” although not “once noticed either in the Iliad, the Odyssey, or the genuine poem of Hesiod; for as to the lines in the former poem alluding to the story of Ganymede, they are manifestly spurious.” Did not the introduction or omission of such subjects depend simply on the poet’s taste? But without entering on the authenticity of this or other passages, which would involve us

in matter beyond our limits, we must observe that Mr. Knight seems frequently to meet difficulties in this manner; a method to which an author should resort as sparingly as practicable, and with the greatest caution. A bold assertion is easily made, even when impossible to maintain. In Sec. 99, the lines in the Iliad concerning Ariadne, Bacchus, and Theseus, are declared to be "*evidently spurious*." In Section 173, "the whole of the Song of Demodocus in the Odyssey" is said to be "an interpolation of a much later date." In Section 206, "the four lines alluding to the dedication of the Brothers of Helen in the Odyssey" are described as "being *undoubtedly spurious*, though exceedingly beautiful;" and again in Sec. 220, note 10, "The four lines in Odyssey M. 69—72, are *manifestly* interpolated." The author has taken we observe so much of hypothesis for his theory itself, that he has overlooked the necessity of proof in his critical remarks.

The following quotation may be interesting to the general reader, although not containing anything new to us now.

"In Stukely's Itinerary is the ground plan of an ancient Celtic or Scandinavian temple found in Zealand, consisting of a circle of rude stones within a square; and it is probable that many others of those circles were originally enclosed in square areas. Stonehenge is the most important monument of this kind now extant, and from a passage of Hecatæus preserved by Diodorus Siculus, it seems to have been not wholly unknown to that ancient historian; who might have collected some vague accounts of the British islands from the Phœnician and Carthaginian merchants, who traded there for tin." "THE HYPERBOREANS," said he, "INHABIT AN ISLAND BEYOND GAUL, IN WHICH APOLLO IS WORSHIPPED IN A CIRCULAR TEMPLE CONSIDERABLE FOR ITS SIZE AND RICHES." This island can be no other than Britain; in which we know of no traces of any other circular temple which could have appeared considerable to a Greek or Phœnician of that age; that the account should be imperfect and obscure is not surprising; since even the most inquisitive and credulous travellers among the Greeks could scarcely obtain sufficient information concerning the British islands to satisfy them of their existence. A temple of the same form was situated upon Mount Zilmissus in Thrace, and dedicated to the Sun, under the title of Bacchus Sebazius; and another is mentioned by Apollonius Rhodius, which was dedicated to Mars, upon an island in the Euxine sea, near the coast of the Amazons.

"The large obelisks of stone found in many parts of the North, such as those at Rudstone and near Boroughbridge in Yorkshire, belonged to the same religion; obelisks, as Pliny observes, being sacred to the sun,

whose rays they signified, both by their form and name. They were therefore the emblems of light, the primary and essential emanations of the Deity; whence radiating the head, or surrounding it with a diadem of small obelisks, was a mode of consecration or dedication which flattery often employed in the portraits both of the Macedonian kings and Roman emperors."

In the next Sections, 103, 104, p. 30, Mr. Knight states that,

"On a Lapland drum the goddess Isa or Disa is represented by a pyramid, surmounted with the emblem so frequently observed in the hands of the Egyptian deities; and the pyramid has likewise been observed among the religious symbols of the savages of North America. The most sacred idol, too, of the Hindoos in the great temple of Juggernaut, in the province of Orissa, is a pyramidal stone; and the altar in the temple of Mexico, upon which human victims were sacrificed to the deity of the Sun, was a pointed pyramid, on which the unhappy captive was extended on his back, in order to have his heart taken out by the priests."

"The spires and pinnacles with which our old churches are decorated come from these ancient symbols; and the weathercocks with which they are surmounted, though now only employed to show the direction of the wind, were originally emblems of the sun; for the cock is the natural herald of the day, and therefore sacred to the fountain of light. In the symbolical writing of the Chinese, the sun is still represented by a cock in a circle; and a modern Parsee would suffer death rather than be guilty of the crime of killing one. It appears on many ancient coins, with some symbol of the passive productive power on the reverse; and in other instances it is united with Priapic and other emblems and devices signifying different attributes combined."

Now to what does all this amount? Neither more nor less than to a fanciful description of probabilities. That the obelisk was the symbol mentioned there can be no doubt, as well as that the pyramid was the same:—that the cock was an emblem of the sun may be unquestionable; but that the spires and pinnacles of our old churches or the weathercocks on them were connected with those ancient symbols may be a pretty suggestion, but can reach no farther. Too extensive a use of imagination is more injurious than its too limited exercise, while the pursuit of any favourite or long cherished theory frequently renders us blind to the most important opposing facts. The *one* desired object is alone kept in view, and many are the posts against which we stumble in our course; to the *one* feeling of the mind we must attend, be the object what it may—religion—politics—or the leg of a

spider. The mental microscope is applied to that object, and while gazing on it in self-absorbed satisfaction we lose sight of all else. We can occasionally observe others similarly employed on different subjects and pity their delusion, little suspecting that like thoughts are passing in their minds regarding us. With all the talent of this work aided by its extensive research, we are inclined to think that Mr. Knight occasionally travels beyond his limits, indulging too freely in fanciful suggestions. All researches into the past must, it is true, be attended with some considerable exercise of imagination; to a sparing indulgence no objection could be raised, but against the intoxications of fancy we must protest. That Mr. Knight may be right in many of his conjectures we do not doubt, but of some we more than entertain a suspicion: it will however be better at once to proceed with his solution, and the destruction of many of our old school companions, we had almost said friends, of whom he disposes in the most summary and wholesale manner.

Sect. 107. "The third eye of this ancient statue (Jupiter, of wood, in the citadel of Argos) was in the forehead; and it seems that the Hindoos have a symbolical figure of the same kind; whence we may venture to infer, that the Cyclops, concerning whom there are so many inconsistent fables, owed their fictitious being to some such enigmatical compositions. According to the ancient theogony attributed to Hesiod they were the sons of Heaven and Earth, and brothers of Saturn or Time; signifying, according to the Scholiast, the circular or central power; the principles of the general motion of the universe above noticed. The Cyclops of the Odyssey is a totally different personage; but as he is said to be the son of Neptune or the Sea, it is probable that he equally sprang from some emblematical figure or allegorical tale. Whether the poet meant him to be a giant of a one-eyed race, or to have lost his other eye by accident, is uncertain; but the former is most probable, or he would have told what the accident was."

Poked out by the ferule of an umbrella perhaps.

"In an ancient piece of sculpture, however, found in Sicily the artist has supposed the latter, as have also some learned moderns."

We have inserted this last clause lest some of our readers, not aware of the fact, should give Mr. Knight himself credit for this mangling of our one-eyed friends. What Homer would have said to "the artist" and "the learned moderns" we know not; but hope that, using the precedent of the Spartan Lysander with the Athenian Philocles, he would have carried out their ideas on

themselves; if indeed they were not more than half-blind already. The "learned moderns" who imagined so much, would have as easily imagined a whole nation of fortuitously one-eyed Calenders, instead of three in the Arabian Nights. It may certainly be justly argued that an eye is an eye; but although not accustomed to consider the Cyclops as beauties, we do not like associating them in our minds with Greenwich pensioners.

In the last part of the 114 sect. we find the origin of Actæon thus described—

"The very ancient colossal statue of the Androgynous Apollo near Miletus, of which there is an engraving from an ancient copy in the Select Specimens, Pl. XII., carried a deer in the right hand, and on a very early gold coin, probably of Ephesus, a male beardless head is represented with the horns of the same animal; whence we suspect that the metamorphose of Actæon, like many other similar fables, arose from some such symbolical composition."

And in Sect. 121. "The beauty of his person and the style of his dress" (the Phrygian Attis) "caused his statues to be confounded with those of Paris, who appears also to have been canonized; and it is probable that a symbolical composition, representing him in the act of fructifying nature, attended by power and wisdom, gave rise to the story of the Trojan prince's adjudging the prize of beauty between the three contending goddesses: a story which appears to be wholly unknown to the ancient poets, who have celebrated the events of the war supposed to have arisen from it."

In this manner is the Judgment of Paris settled; but we would observe that the Eastern use of the apple as a marriage ceremonial, though not referred to by the author, may seem to give some colour to this idea. The horrors of the "Promethens vinctus" of Æschylus are as quickly despatched.—We next learn

Sect. 123. "From the symbolical use of the boar to represent the destroying or rather the antigerative attribute, probably arose the abhorrence of swine's flesh, which prevailed universally among the Egyptians and the Jews."

Is not the law of Moses against the Jews eating swine's flesh sufficient to account for their abhorrence of it without this symbolical solution? and was it not more probably historical than symbolical among the Egyptians, from the death of Timaus?

"The stories of Prometheus were equally allegorical; for Prometheus was only a title of the sun, expressing providence or foresight; wherefore his being bound in the extremities of the earth, signified originally no more than the restriction of the power of the

sun during the winter months, though it has been variously embellished and corrupted by the poets; partly perhaps from symbolical compositions ill understood, for the vulture might have been naturally employed as an emblem of the destroying power."—Section 124.

We take the same objection here as in the preceding case; namely, that the symbol arose more probably from the historical fact. The next extract needs no introduction.

Sect. 135. "The mythological personages Castor and Pollux, who lived and died alternately, were the same as Bacchus and Apollo; whence they were preeminently distinguished by the title of the GREAT GODS in some places, though in others confounded with the canonized or deified mortals the brothers of Helen. Their fabulous birth from the egg, the form of which is retained in the caps usually worn by them, is a remnant of the ancient mystic allegory, upon which the more recent poetical tales have been engrafted; whilst the two asterisks and the two human heads, one going upwards and the other downwards, by which they are occasionally represented, more distinctly point out their symbolical meaning, which was the alternate appearance of the sun in the upper and lower hemispheres. This meaning, being a part of what was revealed in the mysteries, is probably the reason why Apuleius mentions seeing the sun at midnight among the circumstances of initiation, which he has obscurely and enigmatically related."

On the rape of Europa is the following.

Sect. 144. "It is in the character of the destroying attribute that Diana is called ΤΑΥΡΟΠΟΙΟΔΑ and ΒΟΩΝ ΕΛΑΤΕΙΑ, in allusion to her being borne or drawn by bulls, like the Destroyer among the Hindoos; and it is probable that some such symbolical composition gave rise to the fable of Jupiter and Europa; for it appears that in Phœnicia, Europa and Astarte were only different titles for the same personage, who was the deity of the moon, comprehending both the Diana and celestial Venus of the Greeks; whence the latter was occasionally represented armed like the former, and also distinguished by epithets which can be properly applied only to the planet, and which are certainly derived from the primitive planetary worship."

As Mr. Knight's use of the lotus or water-lily is extensive, and his description of it interesting, we cannot do better than place it before our readers, premising that from it according to our author, has sprung *every order of Grecian architecture*.

Sect. 146. "The mystic symbol called a modius or *ποδος*, which is upon the heads of Pluto, Serapis, Venus, and Fortune or Isis, appears to be no other than the bell or seed vessel of the lotus or water-lily, the nymphæ

nelumbo of Linnæus. This plant, which appears to be a native of the eastern parts of Asia, and is now found in Egypt, grows in the water; and amidst its broad leaves, which float upon the surface, puts forth a large white flower, the base and centre of which is shaped like a bell or inverted cone, and punctuated on the top with little cells or cavities, in which the seeds grow. The orifices of these cells being too small to let them drop out when ripe, they shoot forth into new plants in the places where they were formed, the bulb of the vessel serving as a matrice to nourish them until they acquire a degree of magnitude sufficient to burst it open and release themselves; when they sink to the bottom or take root wherever the current happens to deposit them. Being, therefore, of a nature thus reproductive in itself, and as it were of a viviparous species among plants, the nelumbo was naturally adopted as the symbol of the productive power of the waters, which spread life and vegetation over the earth. It also appeared to have a peculiar sympathy with the sun, the great fountain of life and motion, by rising above the waters as it rose above the horizon and sinking under them as it retired below. Accordingly, we find it employed in every part of the northern hemisphere where symbolical worship either does, or ever did prevail. The sacred images of the Tartars, Japanese and Indians, are almost all placed upon it, and it is still sacred both in Tibet and China.

In Sect. 149, Mr. Knight attacks those who, as he expresses it, "have reduced as much as possible the limits of ancient history, notwithstanding the obstinate evidence of those monuments of art and labour which still stand up in their defence." This is at once taking it for granted that they are wrong, which surely should not be done in so concise a manner and only on the evidence of the extent of monuments. We know what works were achieved by eastern monarchs in an incredibly short period, and that the labour of their multitudes was not a matter of consideration; the canal through the Isthmus of Sana for instance being a work, according to Herodotus, of more ostentation than utility. We ourselves are thankful for any information that may extend and simplify our knowledge of past ages, when founded upon correct data. The argument indeed of Mr. Knight in favour of a longer period, in Sect. 151, appears at first to be well supported; but on looking at Mr. Cory's excellent "Chronological Inquiry" and noting his direct calculations ("every one of which," he justly says, "is founded upon historic record without the slightest variation to accommodate") we at once acknowledge ourselves bound to give credence to such testimony in preference to isolated evidence; as of Herodotus being shown, and Hecatæus, the statues of 341 successive priests, each

of whom was compelled by custom to erect a colossal figure of himself. It is not on such a circumstance, dependant on such a priesthood, that we can depend, when opposed to the result of calm and general inquiry.

We will now proceed with our author's suggestion regarding the Grecian orders of architecture.

"But remote as the antiquity of the Egyptian remains seems to be, the symbols which adorn them appear not to have been invented by that, but to have been copied from those of some other people, who dwelt on the other side of the Erythræan ocean. Both the nelumbo and the hooded snake, which are among those most frequently repeated, and most accurately represented upon all their sacred monuments, are, as before observed, natives of the East; and upon the very ancient Egyptian temple near Girge, figures have been observed exactly resembling those of the Indian deities, Juggernaut, Gonnas and Vishnoo. The Egyptian architecture appears, however, to have been original and indigenous, and in this art only the Greeks seemed to have borrowed from them; the different orders being only different modifications of the symbolical columns which the Egyptians formed in imitation of the nelumbo plant.

"The earliest capital seems to have been the bell or seed vessel, simply copied, without any alteration except a little expansion at the bottom to give it stability. The leaves of some other plant were then added to it, and varied in different capitals according to the different meanings intended to be signified by these accessory symbols. The Greeks decorated it in the same manner with the foliage of various plants, sometimes of the acanthus, and sometimes of the aquatic kind; which are, however, generally so transformed by their excessive attention to elegance, that it is difficult to ascertain them. The most usual seems to be the Egyptian acacia, which was probably adopted as a mystic symbol for the same reasons as the olive; it being equally remarkable for its powers of re-production. Theophrastus mentions a large wood of it in Thebais, where the olive will not grow; so that we may reasonably suppose it to have been employed by the Egyptians in the same symbolical sense. From them the Greeks seem to have borrowed it about the time of the Macedonian conquest, it not occurring in any of their buildings of a much earlier date; and as for the story of the Corinthian architect, who is said to have invented this kind of capital from observing a thorn growing round a basket, it deserves no credit, being fully contradicted by the buildings still remaining in Upper Egypt.

"The Doric column, which appears to have been the only one known to the very ancient Greeks, was equally derived from the nelumbo, its capital being the same seed

vessel pressed flat as it appears when withered and dry; the only state, probably, in which it has been seen in Europe. The flutes in the shaft were made to hold spears and staves, whence a spear-holder is spoken of in the Odyssey as part of a column: the triglyphs and blocks of the cornice were also derived from utility; they having been intended to represent the projecting ends of the beams and rafters which formed the roof.

"The Ionic capital has no bell, but volutes formed in imitation of sea shells, which have the same symbolical meaning. To them is frequently added the ornament which architects call a honeysuckle; but which seems to be meant the young petals of the same flower viewed horizontally, before they are opened or expanded. Another ornament is also introduced in this capital, which they call eggs and anchors; but which is, in fact, composed of eggs and spear heads, the symbols of passive generative and active destructive power, or, in the language of Mythology, of Venus and Mars.

"These are in reality all the Greek orders, which are respectively distinguished by the symbolical ornaments being placed UPWARDS, DOWNWARDS, OR SIDEWAYS; wherefore, to invent a new order is as much impossible as to invent an attitude or position which shall incline to neither of the three. As for the orders called Tuscan and Composite, the one is that in which there is no ornament whatsoever, and the other that in which various ornaments are placed in different directions; so that the one is in reality no order, and the other a combination of several."—Sects. 152—156.

We shall leave the consideration of these suggestions to our readers—they are amusing and ingenious, if not instructive; carrying an air of probability which our cooler judgment may reject, but which is worth examination. With the solution we confess ourselves unsatisfied; the elegant Corinthian does not at all answer to its symbolical description, but more fully verifies the old-fashioned notion of foliage drooping over the top of a basket, whether the carrier of the basket happened to be a Corinthian or Egyptian; we would venture to suggest for the Ionic, as equally symbolical with sea shells and of much more frequent occurrence, Bulls' or Rams' horns; the graceful curve of that order being by this means attained without seeking in another element for that which can be more powerfully expressed in our own; and in even more perfect accordance with the symbolical language of the nation.

Mr. Knight, in Sect. 167, speaking of "parents making their children to pass through the fire," states that "in India it is still performed by mothers passing through the flames with their children in their arms;" and that he thinks commentators wrong, as they

certainly are, in supposing them to have been burnt alive; continuing, that this mode of consecration to the deity is now performed in Ireland, "and held to be a holy and mystic means of communion with the great active principle of the universe."

In Sect. 168, however, he acknowledges

"It must be admitted that the Carthaginians and other nations of antiquity did occasionally sacrifice their children to their gods in the most cruel and barbarous manner; and, indeed, there is scarcely any people whose history does not afford some instances of such abominable rites. Even the patriarch Abraham, when ordered to sacrifice his only son, does not appear to have been surprised or startled at it; neither could Jephtha have had any notion that such sacrifices were odious, or even unacceptable to the Deity, or he would not have considered his daughter as included in his general vow, or imagined that a breach of it in such an instance could be a greater crime than fulfilling it."

We are aware that a custom of sacrificing the eldest, only, or most valued child, existed among the earliest nations; but that the patriarch Abraham should not have expressed surprise, or shown any misgivings—and be it remembered that we are not told what he felt at the command of his Creator—will not form a subject of wonder when we reflect on all the circumstances that had preceded it.

The child Isaac had been granted him by a miracle in the old age of himself and wife. He was in the habit of direct communication with the Deity. By His direction had he been guided in his journeyings, and preserved from many and evident dangers. He could feel no doubt that it was Jehovah who required his son of him, and he consequently did not venture to betray a question of the course to be pursued. The very fact recorded by our author was the cause of Abraham's being so eminently rewarded: the unwavering steadiness of his faith "was imputed unto him for righteousness." To the introduction of Jephtha's vow we entirely object, while the method of insertion here deserves reprehension: Mr. Knight must have known, as who does not? the fact of the sacrifice of Jephtha's daughter to have been a long controverted point. Was it right then to advert to it, whatever might be his opinion, as an unquestionable illustration? For our own parts we have ever regarded the vow of the father as two-fold—"It shall surely be the Lord's, or I will offer it up for a burnt-offering," Judges xi. v. 31, and its fulfilment we have considered as carrying out the former intention, that of devoting his child to God in perpetual vir-

ginity. The words, we think amply bear this construction. "And it came to pass at the end of two months, that she returned unto her father who did with her according to his vow which he had vowed: and she knew no man. And it was a custom in Israel." Judges xi. v. 39. In answer to the author's general insinuation on this subject, we would remind his readers that human sacrifices were not only forbidden by the Jewish law, but declared abominable to God.

The following passage is pretty, while the next will be found to contain interesting facts.

Sect. 169. "The celestial or ætherial soul was represented in symbolical writing by the butterfly; an insect which first appears from the egg in the shape of a grub, crawling upon the earth, and feeding upon the leaves of plants. In this state it was aptly made an emblem of man in his earthly form; when the Athenian vigour and activity of the celestial soul, the *DIVINE PARTICULA MENTIS*, was clogged and encumbered with the material body. In its next state, the grub becoming a chrysalis appeared, by its stillness, torpor, and insensibility, a natural image of death, or the intermediate state between the cessation of the vital functions of the body and the emancipation of the soul on the funeral pile; and the butterfly breaking from its torpid chrysalis, and mounting in the air, afforded a no less natural image of the celestial soul bursting from the restraints of matter, and mixing again with its native æther. Like other animal symbols it was by degrees melted into the human form: the original wings only being retained to mark its meaning. So elegant an allegory would naturally be a favourite subject of art among a refined and ingenious people; and it accordingly appears to have been more diversified and repeated by the Greek sculptors than almost any other which the system of emanations, so favourable to art, could have formed."

On this point we would also refer to our last number, p. 224, where the butterfly is used, and we think with great elegance, as a symbol of love-fancies and imaginings by the Chinese.

Sect. 167. "The Egyptians are said to have represented the pervading spirit or the ruling providence of the Deity by the black beetle, which frequents the shores of the Mediterranean Sea, and which some have supposed to be an emblem of the sun. It occurs very frequently upon Phœnician, Greek, and Etruscan, as well as Egyptian sculptures; and is sometimes with the owl, and sometimes with the head of Minerva, upon the small brass coins of Athens. It is of the Androgynous class, and lays its eggs in a ball of dung or other fermentable

matter, which it had previously collected, and rolled backwards and forwards upon the sand of the sea until it acquired the proper form and consistency; after which it buries it in the sand, where the joint operation of heat and moisture matures and vivifies the germs into new insects."

In speaking of dancing Mr. Knight alludes, sect. 187, to Socrates and Sophocles cultivating it as a useful and respectable accomplishment, and of its being classed by Aristotle with poetry. At the latter part of the same section he says—

"The ancient dancing, however, which held so high a rank among liberal and sacred arts, was entirely imitative; and esteemed honourable, or otherwise, in proportion to the dignity or indignity of what it was meant to express. The highest was that which exhibited military exercises and exploits with the most perfect skill, grace, and agility; excellence in which was often honoured by a statue in some distinguished attitude; and we strongly suspect that the figure commonly called 'the fighting gladiator' is one of them; there being a very decided character of individuality both in the form and features; and it would scarcely have been quite naked had it represented any event in history."

We shall leave it for others to determine upon the probability of Mr. Knight's "suspicion," merely remarking that we thought fighting Gladiators were sometimes as much disencumbered of clothes as dancers, and that consequently we do not see why it might not as well be the original as the imitation: we pass on to the conic stones, upon which our author forms another suspicion.

"Stones of a similar conic form are represented upon the colonial medals of Tyre, and called ambrosial stones; from which probably came the amberies so frequent all over the Northern Hemisphere. These, from the remains still extant, appear to have been composed of one of these cones let into the ground, with another stone placed upon the point of it, and so nicely balanced that the wind could move it, though so ponderous that no human force unaided by machinery can displace it: whence they are now called LOGGING ROCKS, and PENDRE STONES, as they were anciently LIVING STONES and STONES OF GOD; titles which differ but little in meaning from that on the Tyrian coins. Damascius saw several of them in the neighbourhood of Heliopolis or Baalbeck, in Syria; particularly one which was then moved by the wind; and they are equally found in the western extremities of Europe and the eastern extremities of Asia, in Britain, and in China. Probably the stone which the patriarch Jacob anointed with

oil according to a mode of worship once generally practised, as it still is by the Hindoos, was of this kind."—Sect. 197.

Why the stone which formed the pillow for Jacob's head should "probably" have been "of this kind," we are at a loss to conjecture, unless we could imagine the patriarch providing for future travellers being *rocked* to sleep. Neither would the process of setting "such a stone up for a pillar," which we are informed he did, have been an easy task even for Jacob, as in the foregoing description we are told the upper stone was "so ponderous that no human force unaided by machinery could displace it." The placing it we should have imagined to have been a somewhat more difficult undertaking. But arguments on such *probabilities* are thrown away, and we can only regret that a work so full of information and research should be defaced by so many absurd puerilities. We turn with pleasure from this subject to section 203, where the author says—

"This custom of canonizing or deifying men seems to have arisen from that general source of ancient rites and opinions, the system of emanations; according to which all were supposed to partake of the divine essence, but not in an equal degree; whence, while a few simple rites, faintly expressive of religious veneration were performed in honour of all the dead, a direct and explicit worship was paid to the shades of certain individuals, renowned for their great virtues or great vices, which if equally energetic, equally dazzle and overawe the gaping multitude."

We consider the following observations to be correct, while experience unfortunately tends to confirm the concluding probability.

"But what contributed most of all towards peopling the coasts and islands, both of the Mediterranean and adjoining ocean, with illustrious fugitives of that memorable period, was the practice of ancient navigators in giving the names of their gods and heroes to the lands which they discovered in the same manner as the moderns do those of their saints and martyrs; for in those early ages every name thus given became the subject of a fable, because the name continued when those who gave it were forgotten. In modern times every navigator keeps a journal, which, if it contains any new or important information, is printed and made public; so that when a succeeding navigator finds any traces of European language or manners in a remote country, he knows from whence they came; but had there been no narratives left by the first modern discoverers, and subsequent adventurers had found the

name of St. Francis or St. Anthony with some faint traces of Christianity in any of the islands of the Pacific Ocean, they might have concluded, or at least conjectured, that those saints had actually been there; whence the first convent of monks that arose in that colony would soon make a complete history of their arrival and abode there; the hardships which they endured, the miracles which they wrought, and the relics which they left for the edification of the faithful, and the emolument of their teachers."—Sect. 209.

In sect. 211. we have an attack upon (we presume) Mr. Bryant, "for entirely rejecting the testimony of Thucydides in his account of the ancient population of Greece, and receiving in its stead that of Cedrenus, Syncellus and other monkish writers of the lower ages, and other crimes of a like character." We will not interfere in this matter further than to show that there are two opinions of Mr. Bryant by quoting a few lines from Mushet's "Trinities of the Ancients."

"I cannot," (says that gentleman) "mention the name of Jacob Bryant without reverence and admiration. His love of truth; his profound and extensive learning; and his admirable judgment, constitute him a great authority in everything relative to antiquity;" and, again, "I am happy to say that I coincide in most of his conclusions, wrought out by unparalleled industry and surprising erudition. His great work on '*The Ancient Mythology*' must continue to be the wonder of posterity: it is honourable, as much to the country in which it was produced, as to the great and inestimable author himself."

In justice to Mr. Bryant we have given this quotation, and shall support it by another—"in medio tutissimus ibis." Thucydides undoubtedly revived and preserved the legends of the Greeks, but we are not aware that these were the earliest traditions. Till the Pelasgi can be traced are we not justified, with Bryant, in examining every relic of antiquity?

In sections 213, 214 and 215, we have a sweeping consecutive condemnation of Sanchoniatho, Eusebius, Alexander's Letter to his Mother, and Warburton, while the early Christian writers are not spared for countenancing the first; we will, however, quote the remarks on them and Eusebius, in order "that the urbanity and kindness with which he opened the treasury of his mind," as described by his editor, may be made evident.

"The early Christian writers, however, took it (Sanchoniatho) under their protection, because it favoured that system, which, by degrading the old, facilitated the progress

of the new religion; but in whatever else these writers may have excelled, they certainly had no claim to excellence in either moral sincerity or critical sagacity; and none less than Eusebius, who, though his authority has lately been preferred to that of Thucydides and Xenophon, was so differently thought of by ecclesiastical writers of the immediately subsequent ages, that he is one of those by whose example they justified the practice of holy lying, or asserting that which they knew to be false, in support of that which they believed to be true."—Sect. 214.

The only reference given in support of these allegations is of so general a kind as to contain no further direction than "pro libro adv. Jovinian." The characters of the early Christian writers and of Eusebius stand on too high a pinnacle to be touched by darts hurled by Mr. Knight. He and every other man has a perfect right to differ from preceding writers, whether dead or living; but there can be no necessity in that difference for wholesale abuse, or even the imputing improper motives to the opposite party. Eusebius' name stands high as an authority—late researches have tended to establish him—that he sometimes errs there can be no doubt, and what author ever existed whose works were perfect? but that he deceives intentionally we deny, while the result of our knowledge of his chronological inquiries speaks much for his general accuracy. A reference to Cory's Fragments,* and the recent Venetian edition of a similar work, amply establishes this fact. Our author, in common with Eusebius, has returned to his parent earth, and we should much regret writing a sentence that would cause an angry or unpleasant feeling in the minds of his friends; at the same time we cannot suffer posthumous works to disseminate error without notice; and in the present instance have felt compelled to animadvert upon such portions as we consider objectionable, while we have endeavoured to bestow our meed of praise upon other parts and upon the general learning and research displayed.

The following quotations we shall introduce without comment.

Sect. 220, (latter part.) "The Egyptians represented the sun in a boat instead of a chariot; from which boat being carried in procession upon men's shoulders, as it often appears in their sculptures, and being ornamented with symbols of Ammon taken from the ram, probably arose the fable of the Argonautic expedition; of which there is not a trace in the genuine parts of either of the

* What an admirable, concise, and invaluable supplement might be formed to this excellent work by references alone to similar passages in all the Greek writers.

Homeric poems. (Why should there ?) The Colchians indeed were supposed to be a colony of Egyptians, and it is possible that there might be so much truth in the story, as that a party of Greek pirates carried off a golden figure of the symbol of their god ; but had it been an expedition of any splendour or importance, it certainly would have been noticed in the repeated mention that is made of the heroes said to have been concerned in it."

We are informed, in Sect 225, that "the most common mode of signifying deification in a portrait, was representing the figure naked, or with the simple chlamys, or mantle, given to the statues of the gods."

In the latter part of the same Section we are told that "a deified or canonized Roman emperor was not called Deus, but Divus ; a title which the early Christians equally bestowed on the canonized champions of their faith." The grateful enthusiasm of Virgil, Ec. 1, bestowed the former appellation.

Sect. 231. "The only certain proof of plagiarism, or borrowing, is, where the animal or vegetable productions of one climate are employed as symbols by the inhabitants of another ; as the lion is in Tibet, and as the lotus and hooded snake were in Egypt, which make it probable that the religious symbols of both those countries came originally from the Hindoos. As commercial communications, however, became more free and intimate, particular symbols might have been adopted from one people by another, without any common origin, or even connection of general principles ; though between Egypt and Hindostan the general similarity is too great in points remote from common usage to have been spontaneous or accidental."

We have the following observations on India in Sect. 232.

"Should the pious labours of our missionaries succeed in diffusing among them a more pure and more moral, but less uniform and less energetic system of religion, they may improve and exalt the characters of individual men ; but they will for ever destroy the repose and tranquillity of the mass. The lights of European literature and philosophy will break in with the lights of the Gospel ; the spirit of controversy will accompany the spirit of devotion ; and it will soon be found that men who have learned to think themselves equal in the sight of God will assert their equality in the estimation of men. It requires therefore no spirit of prophecy, nor even any extraordinary degree of political sagacity, to fix the date of the fall of European domination in the East from the prevalence of European religion."

What results may lie in the womb of time we cannot say ; but the foregoing remark is well worthy of the most serious considera-

tion at the present moment, when so many concessions are making to the spirit of practical theorizing, without the slightest regard to the religious prejudices, and these are RIGHTS, of the natives of Hindostan.

ART. IV.—*Lettres inédites de Marie Stuart, accompagnées de diverses Dépêches et Instructions, 1558–1587. Publiées par le Prince Alex. Labanoff. 8vo. Paris, 1839.*

THE historical world, and the reading public of Europe, have long before now, we believe, made up their minds upon the oft-mooted question as to the guilt or innocence of Mary Stuart, and even, in great measure, as to the degree in which she was implicated in the plots of the times. Yet the subject will afford an eternal interest. It was not merely a question of dry historical fact, in which conflicting testimonies were to be examined and weighed together, and the value of each witness calmly ascertained ; it was not merely mixed up with a political question, nor complicated only by that most difficult of considerations, the tendency and collision of rival and hostile creeds. Yet this alone might suffice, for, in this case, the best and holiest feelings of our nature, enlisted in the worst of causes, are so liable to perversion and deterioration in themselves, and so easily warped to the vilest courses under the most sacred of sanctions, half hallowing even while it debases, that the severest scrutiny and soundest judgment of inquirers are continually misled in the examination of feelings and passions that continually deceived even those whom they actuated at the time.

These causes, however efficient to throw doubt over the subject, are not the sole complications. Historic certainties and sectarian violence do not always maintain their importance ; the struggle of a rising against a failing religion, even though its epoch was the era of emancipation from political through religious thralldom, is not always a matter of equal interest to all, even of the descendants of those who fought the great fight of its liberty. But in regarding the particular case before us, we find a deeper thread is interwoven throughout the web ; a softer pulse is awakened, and in the universal breast, that asks nothing from judgment or devotion. Apart from all other considerations, the difficulties of Mary's position, the passions, prejudices, ambition, the vices and violences of her masters and tyrants, whether followers

or enemies, stand out in fearful relief, and excuse, in spite of our judgments, her own unnumbered faults. We view her as the subject of Grecian tragedy, the single victim of unrelenting fates; and her youth, her rank, her sex, her isolation; her utter helplessness, and the unrivalled beauty that provoked and exaggerated, yet defied, sustained, and half atoned misfortune, all join to form the halo that sheds light on that corruption. We rise from the damning tale of evidence as from a painful romance, and drown unwilling censure in sad and sorrowing admiration. We feel by the head and think by the heart: the truth of history fixes the case in our minds, and imagination invests it with a constant though factitious charm. We read the facts and are convinced; yet turn to fancy, and prefer to doubt.

If anything, however, were wanting to complete the chain of evidence against the ill-judging and unfortunate Mary, it would be the letters published in the volume before us. Yet if they leave no doubt whatever of the reality of circumstances upon which she was condemned, we question much if they will in the least diminish the personal interest in her fate. Nothing but this could have stood out so long against the accumulated and daily increasing proofs of her guilt: but this, we conceive, will last as long as her name, and ever plead, and plead effectually, the many extenuating circumstances that excuse and perhaps justify her conduct, while they certainly demand sympathy for that hopeless woman, so unequal to the times in which she was placed; whose political guilt was but weakness; whose sin to heaven was only her religion; whose insincerity was adherence to her creed; while her very birth was treason, and her beauty the real crime that could look for no pardon from her triumphant and vindictive rival.

We need not enter more fully upon a subject so often discussed, but proceed to a general abstract of the volume before us.

Prince Labanoff informs us, that in making, about eight years since, various researches in a rich collection of MSS., which, however, circumstances forbid his naming at present, he met with various letters of the unfortunate Mary Stuart, and which he believed to be unedited. Unfortunately the copies made for him were found incorrect, and he has therefore now published only his previous collection, from the Bibliothèque Royale and the Archives of the Kingdom, at Paris. This consists of thirty-five letters of the Queen's, her testament, the warrant and report of her execution, together with sixteen diplomatic despatches and memoirs concerning especially the latter years of her life.

With the exception of the warrant and four of M. de Chateaufort's despatches, which have appeared in Lord Francis Egerton's *Life of Chancellor Egerton*, a rare book and unfinished, the prince conceives the rest to be unpublished; for so many and imperfect have been the collections already before the world, and so altered by translation from their original French into English, Scotch, and Latin, and then re-translation, that it is not easy to speak with certainty on the subject.

A fertile source of errors has also been found in the uncertainty of dates, into which two changes were introduced within eighteen years. First by the Edict of Roussillon, which, in 1564, altered the first day of the year from Easter eve to the 1st January; and, secondly, by Pope Gregory XIII's bull, reforming the calendar in Catholic countries, October 5, 1582; while it was not altered in England or Scotland till 1752. Mary Stuart continued, it seems, to date her letters by the old style, while the French king and his ambassadors adopted the new: and the difference of ten days is the exact difference in the two dates of the Queen's execution, the 8th and 18th February, 1587, as established by M. de Chateaufort's despatch of February 27th.

A chronology of Mary Stuart's history, compiled from Castelnau, Robertson, Lingard, Raumer, &c. assists the reader's memory in perusing the collection itself.

The contents of the first letter prove it to have been written 1558-9, shortly after the marriage with the Dauphin, and give a first indication of that injustice with which Mary was afterwards so lavishly treated in France, by an attempt in the former instance to deprive "her and her husband of what the king had given them." A subsequent letter dated Edinburgh 10th August, 1562, and addressed to M. de Gonnor, superintendent of finance, requests his assistance to recover the balance of her dowry and some compensation for other matters.

An instruction, July 11, 1566, from the King of France to Castelnau, on his journey to Scotland to congratulate Mary on the birth of her son, (James VI.) after complimenting Elizabeth on his way, recommends him to present letters of congratulation also to the king (Darnley,) but only in such a manner as shall be pleasing to Mary; and a similar reservation is placed upon the envoy's communications with the Scottish nobles. The same document, referring to the succours in men and money required by the queen, promises the former if the necessity should be found by the envoy to continue; and the passage regarding the money, so

difficult for the French treasury, we extract, as curious :

"And further, as the said Sr. de Mauvissière states that he thinks that the said Lady Queen of Scotland will inquire of him what assurance he brings her of the aid which the king wishes to afford her in her affairs, as well in men as in money, if the said lady speaks of it to him he will answer :

"That M. the Cardinal de Lorraine having made known to their Majesties that the said Lady was in want of money, and seeing that the King from the necessity of his affairs, could send her nothing from himself, prayed their Majesties to let him be supplied with the 60,000 livres which were due to him of his pensions, which their Majesties did willingly ; and because that there was not then enough ready money in the hands of the treasury of the Espargne to supply the said sum in deniers, they caused the said treasurer to engage in his own proper and private name to those from whom my said Lord the Cardinal should receive the said amount, which their Majesties conceive he will not have failed to send to the said Lady, knowing as he did the necessity for it. And this said Lady can entertain no doubt that if his Majesty had as much money (deniers) in his treasury as good will to supply the sum to the said Lady she would always find his purse open and at her service.

"As for sending her supplies of men, their Majesties have understood from various sources that the affairs of her kingdom are at this time in such peace and tranquillity, and she, to whom God has given so fine and desirable an heir, so revered and obeyed, that they confide that she has no desire but to reconcile her subjects with each other if there remains among them any enmity for the past, and to preserve her kingdom in peace and tranquillity, and this is why they have not thought it needful to give on this head any charge to the said M. de Mauvissière. But if matters are otherwise, which they cannot believe, and that the said Lady has need of assistance, she will let this be known, if she pleases, to the Sieur de Mauvissière, in order that at his return, he may report it to their said Majesties, who will always act in favour and for the aid of the said Lady, which she may promise herself and rely upon from princes the firmest and dearest friends to her in this world."—pp. 15—17.

The death of Darnley followed, and the fatal affair of Bothwell ; if disgraceful to the queen herself, assuredly far more disgraceful to the nation who suffered and their nobility who connived at, this insult to the royal dignity and their own. Prince Labanoff notices, 1567, the pregnancy of Mary by Bothwell, affirmed by Lingard, and her refusal to disavow him and illegitimatize his infant ; this was a daughter, born 1568 at Lochleven, and who took the veil at Notre Dame de Soissons. The fact is stated by

Le Laboureur in his *Memoirs of Castelnau*, and him the prince considers worthy of credit ; the more as his confidential situation at the French Court (he was Royal Almoner and Counsellor) allowed him access to state secrets, and to the registers of the Convent of Soissons.

Mary now surrendered herself to Elizabeth (16th May,) and the next letter in the collection, October 22, 1568, refers to the appointment of "Rosse, Hereis, and Kilvounin," as commissioners to York, where according to "Beton, Archbishop of Glasgow," nothing was done, though the Bastard of Scotland was present.

Two succeeding letters from Mary to the Duc de Nemours, May and October, 1570, evince her anxiety as to any efforts making in her favour by her family, owing to the difficulty of communicating with them ; the letters sent by M. de Pougny being now "old and still here" (Chatsworth.)

A letter, June, 1578, is to M. d'Humières, once in the service of Mary's first husband, and forwarding the expedition of some seignorial rights with many expressions of kind remembrance for his services : another letter, September, 1580, accompanies a present of two geldings for M. de Guise : and one from Sheffield, in February, 1581, also to Castelnau, and desiring some boxes of dresses to be sent speedily from her tailor, declares also her vexation at being "counteracted by those of her counsel" in the gift of a benefice to this faithful envoy ; "not choosing to suffer that her commands should be traversed as they have so often been, even in matters of her own." She owns her want of money for the payment of her attendants, and even for her own comfort :

"My malady has become much worse in the last four or five days, and though it has almost brought me to extremity, I have not been able to obtain any one thing necessary and requisite for my health. I am better now, but still feeble and attenuated. I could wish that the Queen of England, Madame my good sister, (!) would have some little regard to the things needful for the restoration and preservation of my health, and allow me to ride on horseback about this place when I recover. Request this, if you please, and send me an answer by the first opportunity."

Unfortunate queen ! Her next letter, September 2, 1582, declares that if some amelioration of her captivity does not take place she has little hope of surviving the winter.

The complaints of Elizabeth against the French King and Court occupy the next letter, a despatch from Castelnau to Henry

III; especially with regard to harbouring the traitors and rebels, "my lord Paget and his brother, Charles Arondel, and some others of their accomplices;" and to the communications maintained by the ambassador with various English nobles and others, and his interference with the affairs of the Queen of Scots. This produced a detailed recrimination on the ambassador's part.

"The said queen perceiving that I spoke in this fashion, and that I knew so much of her conduct by the allegation of infinite cases, she told me that she had thought she had reason to be angry with me, but that my complaints were the strongest. That she had trusted me as a brother in the affair of the marriage; but that now I had taken another course." * * *

The ambassador replied with firmness, alluding to the treatment of Mary in prison, and his duty to interfere.

"The queen, seeing that I spoke in this strain, and with so much truth and reasons so strong that she could not answer one of them, begged me to discontinue these remarks, and speak of something more agreeable: but I wished to obtain one conclusion, (namely) that she was greatly obliged to you and the queen your mother, in all cases, for the frank manner in which you acted towards her in general."

"Archubal Duglæ has requested me to lend him a thousand crowns. * * * The said Archubal, a man of quality and great merit, has refused a pension of two thousand crowns from the Queen of England."

We must pass over the letter of Henry III. to his sister and other passages, to extract one from Mary herself to Castelnau. Du Glas (Douglas) had not attended to her wish to remain out of Scotland.

"Especially do not let him know in any shape that you maintain the least secret communication in the world with me, for I perceive that the negotiations carried on by Walsingham between you and him are only to discover, by the replies made by you on my part, whether you have still any means of communicating with me in secret. * * * Let them fancy what they please as to the means by which you learn my intentions."

In another letter she says—

"Beale is gone from here; * * * the report he has made of my replies and negotiations with him, has been most maliciously perverted and interpreted by some of the council. He is no less angry than myself; for I have never said those things as they have been understood, and he has no way reported and related them thus. Walsingham has acted, I imagine, like his peers in matters of religion; he has cut and falsified the text."—p. 97.

On the 30th of October, 1584, she writes
VOL. XXIII.

to urge Castelnau, on her intended removal from the custody of Lord Shrewsbury, to insist upon a rigorous examination of the reports about that nobleman and herself, spread by the countess; also to procure that her next keeper shall not be one of the pretenders to her crown, as her life would not be safe; and that it should be a personage of sufficient power and authority to guard this in the possible case of the Queen of England's death, &c.

In a letter dated simply the same year, Mary informs the ambassador, in enclosure, of the discussions between the English deputies and herself, which they desired should be kept profoundly secret! She states also that she had written strongly to her son, whom Elizabeth wished to detach from the French league and join with one in England, against this course. She adds—

"Tell Archubal Du Glas from me that I know for certain that this Queen has no desire to send him to Scotland; and hereon, that my opinion is that he should accept from her any appointment he receives, labouring by every demonstration in his power to assure Walsingham of his true attachment to the Queen of England, in order if possible to discover her intention with regard to myself and my son. And henceforth require him, from me, to try in conferring with Walsingham, and casually leading to the question of my freedom, to sound his opinion: and what he discovers pray apprise me of, if you please, by the first occasion."

We pass over Leicester's suspicious protestations of good-will, and the jealousy of Elizabeth towards Talbot, Rutland, and others supposed to be interested in behalf of the imprisoned queen; and whose accord and friendship had thrown Elizabeth into such distrust and anger, that according to Castelnau, who relates all the foregoing, "if she could ruin them she would do it," (p. 113.) Mildmay and Revel, he adds, were to remove her to the castle of Harford; it was said they wished to be excused the task; but "the people here are all so double (faced) and false in every word, that one cannot place credit in them, nor assume any certainty."

The letters of the Queen of Scots to Mendoza, the Ambassador of Philip II., 30th of May, N. S. 1586, confirm the testament noticed by Robertson. Mary declares that in case her son, James, did not before her death embrace the Catholic faith, of which she saw little chance, she was determined to leave her right of succession to the king his master; as she felt a greater obligation to support the universal right of the Church

than the interests of her posterity. She begs the Ambassador Mendoça to keep this resolution a profound secret, as if betrayed, "it would cause in France the loss of her dowry, in Scotland a rupture with her son, and in this country her total ruin and destruction."

In a subsequent letter to the same, Mary rejoices in the rising spirit of the French king against Elizabeth, and proceeds thus:—

"You cannot conceive how the intelligence of the Earl of Leicester's exploits, and Drake's, have raised the spirit of the enemies of the said king throughout Christendom; and how his so long patience towards this Queen of England had lowered the confidence which all Catholics here have ever reposed in him. Myself, I will freely confess to you, was so disheartened from entering upon new pursuits, seeing the little effect of the past, that I have closed my ears to divers overtures and proposals of enterprizes, which have been made me these six months here by the said Catholics, having no means of giving them a satisfactory answer. But in what I have newly heard of the good intentions of the said King towards this quarter here, I have most amply detailed to the chiefs of the said Catholics a scheme which I have sent them with my opinion upon every point to determine on its execution conjointly; and to gain time I have directed them to send to you some one of them fully instructed, and with all diligence, to treat with you according to the general offers already made you, respecting all things which they will have to require in this affair from the said King your master, you can feel secure of them and their faith and word, which they have passed to me, that faithfully and sincerely they will accomplish at the hazard of their lives what they will promise by their deputy, and therefore I beg you to give them all credit in the matter, as if I myself had sent them; they will inform you of the means of my escape hence, which I shall take upon myself to effectuate provided I am beforehand assured of the recourse to arms (*des armes faictes*)."

This letter is dated Chartley, 27th July, 1586, and requests the twelve thousand crowns for her deliverance to be procured from the king, regretting that the last twelve thousand had profited her so little. The postscript is marked, Aug. 2.

It was about April, 1586, that Gifford and Maude obtained the confidence of Ballard and Morgan; and being thus connected with Mendoça, the Spanish Ambassador in France, and later, with Savage and Babington; so soon as the Queen of Scots had fairly committed herself by writing the above letter, Ballard was arrested by Walsingham's orders, August 4; and four days

afterwards Mary was transferred to Tixal, and all her papers and jewels seized.

M. de Bellièvre set out from Paris, November 17, and arrived on the 27th at Calais, where he received despatches from M. de Chateaufort, praying him to use all speed, as Elizabeth was urging on the trial of the unfortunate Mary. The wind, being contrary, detained him two or three days, but on the 28th he embarked, at midnight, and reached Dover at nine the next morning. Remaining there one day, to recover such of his suite as had suffered from sea-sickness, he reached London, then a two-days' journey, on Sunday, 1st of December, at noon. The next day he sent one of his gentlemen to the queen at Richmond, to request an audience. "As the malice of the queen was infinite," this was delayed, though the trial was pressed with activity; and a rumour, first of the plague at Calais, then of an apprehended attempt on Elizabeth's life, afforded the pretext for deferring the ambassador till the 7th of December.

When MM. Bellièvre and de Chateaufort came into the presence, they delivered the remonstrances of the French king; to this Elizabeth replied by declaring that her own life had been thrice endangered by the attempts of Mary, and that these had cost her more tears than the loss of all her relatives. To the examples in history cited by the ambassadors, she answered, (and with characteristic vanity,) that she had seen and read more books in her life than a thousand others of her sex and quality, but had never met with so cruel an attempt as that made against herself by her kinswoman. She added, that she had found treason where she had placed confidence, and ingratitude for benefits conferred; and that she should shortly forward the proofs to the king and queen of France for them to judge. After expressing her regret to M. Bellièvre that the object of his mission was not more auspicious, she retired to her chamber.

The promised explanations being withheld, the ambassador had audience of leave the 15th of December; and on the 16th the sentence of Mary was pronounced; the city bells were rung for twenty-four hours, and the inhabitants were commanded to light fires before their doors as on festivals. The rest is well-known.

We translate verbatim the farewell letter of the doomed and unfortunate queen to the Duke of Guise; its sad and earnest solemnity is well maintained by the Christian patience of insult recorded at its close.

MARY STUART TO THE DUKE OF GUISE.

24 November, O. S. (4 Dec'r, N. S.) 1586.
My good Cousin, he whom I hold dear-

est in the world, I bid you adieu, being by unjust judgment on the point of being put to death so as none of our race before God has ever suffered, and least one of my station; but, my good Cousin, praise God for it, for I was useless to the world in the cause of God and his Church, being in the state I was, and hope that my death will testify my constancy in the faith, and readiness to die for the maintenance and restoration of the Catholic Church in this unfortunate island; and though never has executioner dipped hand in our blood, be not ashamed of it, my friend, for the judgment of heretics and enemies of the Church, and who have no jurisdiction over me, a free Queen, is profitable in the sight of God to the children of his Church. If I adhered to them I should not suffer this blow. All those of our house have all been persecuted by this sect, witness your good father, with whom I hope to be received into the mercy of the just judge. I recommend to you therefore my poor attendants, the discharge of my debts, and to cause some annual dirge (obit) to be founded for my soul, not at your cost, but to make solicitation and ordinance as shall be requisite, and you will understand my wishes by these my poor helpless attendants, ocular witnesses of this my last tragedy. May God prosper you, your wife, children, and brothers, and cousins, and especially our head, my good brother and cousin, and all his; the blessing of God, and that which I should give to my children, may it be on yours; whom I recommend no less to God than my ill-fortuned and abused (one). You will receive some tokens (rings) from me, in order to remind you to cause prayers for the soul of your poor cousin, devoid of all aid and counsel but that of God, who gives me strength and courage singly to resist so many wolves howling against me, to God be the glory. Believe in particular what will be told you by a person who will give you a ruby ring from me, for I take it on my conscience that you will be told the truth of what I have directed, especially of what concerns my poor attendants, and the share of each. I recommend to you this person for her simple sincerity and honesty, that she may be placed in some good situation. I have chosen her as the least partial and who most simply will report my orders. I pray you that she be not known to have told you any thing in private, as jealousy might injure her. I have suffered much for two years and more, and could not let you know it for an important reason. God be praised for all, and give you the grace to persevere in the service of his Church so long as you live, and never may this glory depart from our race, that men as well as women we be ready to shed our blood to maintain the cause of the faith, all other worldly considerations thrown aside; and for myself, I hold myself born on the paternal and maternal side, to offer my blood thus, and

have no intention to degenerate. Jesus crucified for us, and all the holy martyrs render us, by their intercession, worthy the voluntary offering of our bodies to his glory. From Fotheringay, this Thursday, 24 November.

"They had, to degrade me, caused my days (dais) to be pulled down, and then my keeper came to me offering to write to their Queen, saying not to have done this act by her command, but by the advice of some of her council. I showed them instead of my arms on the said dais, the cross of my Saviour. You will understand all the conversation: they have been more kind since.

"Your affectionate Cousin and perfect friend,

"MARY, Q. of Scotland, D. of France."

The volume before us contains, beyond the Testament of the unfortunate Mary, a Memoir from M. Bellièvre's departure till the 25th of February. Also, a letter from M. de Chateaufort to Henry III. on the 27th, wherein he excuses his silence from the fact of the ports being so strictly guarded that he could not contrive to send off a messenger; a passport which he had obtained in a false name having only procured the arrest of the bearer at Dover, where he had been then detained from the 19th to the 27th of February. This document likewise contains the account of Mary's execution. A report of the same follows, and some letters detailing subsequent events bring us to the decree of the parliament of Paris, which concludes the volume, except a few papers of minor importance contained in the supplement, and found during the process of printing the work.

A repertory of such papers and documents as were known to the Prince de Labanoff is given at the end, though this does not include the letters said to have been written by the unfortunate queen in July, 1536; to Mendoza and Paget on the 6th, to Babington on the 17th and 25th, and on the 27th of that month to Paget; her supposed love-letters also are omitted. It is, however, the Editor's intention to publish all these, as a supplement, in a complete collection.

Of the 352 pieces that form this Repertory, 164 have been already published; 35 are contained in the present volume, the remainder are believed by the prince to be inedited. The collection, too, to which we have alluded in the outset of this article is not included in the enumeration.

ART. V.—*The Agra Ukhbar, for 1838.*
The Calcutta Englishman.

DURING the latter part of the past session, the attention of the Parliament was repeatedly directed to the late succession to the throne of Oude; a subject of no small importance, connected as it is with innumerable other interests in the affairs of the East, whether we view it as a matter of simple right or wrong, or as deeply involving the honour, the integrity, the honesty of those who control the East India Company, and the character of the British nation.

It is a subject for very grave consideration on the part of the British nation, the vast extent of dominion which they possess in Asia, and the means by which they hope to preserve it; whether it is to be by rapine, injustice, fraud, and violence, or by the goodwill and affections of the population. The only permanent security must be in the latter, and no temporary advantage which can be obtained without it, will counterbalance the evils which the former course must ensure; and which ultimately and inevitably will, as it ought to do, lead to our expulsion from the soil of Asia.

It is certainly not a very pleasing task at the present moment to contemplate the precarious state in which our interests in India are reduced, from a variety of external as well as internal causes. The supineness, and even apathy of the British public to these interests, and also to the welfare of our oriental empire, is an evil of the greatest magnitude, since it has sanctioned an accumulation of wrongs and injuries, as ruinous to our character and to the stability of our eastern sway, as they are destructive to the peace and welfare of the Indian community.

But for the presence of the Prince of Oude, Ekbal-ood Dowlah, in London, the recent session would have passed over, and those most extraordinary scenes and proceedings which had so lately taken place at Lucknow, and are thereby obtruded upon our notice, would have been buried in oblivion; and, like innumerable other instances of injustice and oppression, have increased the doleful catalogue of Indian crime, perpetrated by our governors, which, sooner or later, must inevitably lead to resistance. It is quite out of the order of things to suppose that a community of one hundred and twenty millions of people, who are every day becoming more and more enlightened, will submit much longer to a tyrannical sway. The germs of internal discontent are numerous and powerful; so much so, that if once put in action, the united efforts of the Bri-

tish nation never could repress the inevitable consequences. It must be recollected, that besides the natives themselves, who as a nation dislike us, there has sprung up a tolerably numerous population, the offspring of British subjects, amounting now to little short of a million of people, who from their cradles have been the object of contempt to Englishmen, and even to the upper classes of natives, and the victims to an unnatural, cruel, and unnational policy. By birth and education Christians; by the neglect, if not indirect persecution, of the government, thousands of them have been driven to embrace heathenism. They have been subjected to all the rigour of Mahomedan laws, and denied the benefit of British institutions. In these ill-used and persecuted individuals, the time may come when Great Britain may have sincerely to deplore the not having alleviated their condition in society, and cultivated their affections; instead of holding them up, as they have ever done, to the native population as beyond the pale of British society. Of this subject we may speak more fully at a future period; but we have considered it requisite to say this much now, by way of illustrating some one of the actual and positive dangers with which our eastern empire is beset. We do not do this as a matter of complaint; for it has too long ceased to be considered, even by the aggrieved party, as worthy of further appeal to the mother country: nor as having any hope of amelioration or redress, until those revolutions take place in the mental and physical powers of the Indian community, which will induce them to assume as a right that which has been constantly denied them as a matter of justice, not to say favour.

Our Eastern empire has latterly presented a most calamitous picture of famine, disease, pestilence, and death. Thousands of human beings have fallen victims to these; the rivers in some places being literally blocked up with the dead, and in many towns no hands to bury them. In this dreadful state of affairs the utmost alarm was excited by apprehensions of internal commotion in our north-west frontier territories, from the violent and most extraordinary measures which had been pursued, on the death of the late King of Oude, with regard to the appointment of a successor.

It is in vain we look to our external position for an alleviation of our troubles. For some time past the government of India has been making preparations of a defensive character against an approaching second war with the Burmese; and in which the latter have threatened to become the aggressors. In Assam, one of the provinces con-

quered from the Burmese, some conflicts had actually taken place between the troops of the two nations. The Nepaulese, again, who flank or skirt our provinces of Bengal for a space of 600 miles, have been placing the whole chain of these interminable mountains, covered with forests, in a state of defence, avowedly for the purpose of taking the part of the Burmese, in the event of war with the latter.

What consequences such a combination of interests on the part of the Burmese and Nepaulese might produce, it is not difficult to conjecture. The whole line of our frontier, from the point of Teck-Nauff, the southern extremity of the province of Chittagong, in the bay of Bengal, to the provinces of Oude, which are also partially skirted by Nepal, would be exposed to the attack of those hardy mountaineers, whom neither toil nor danger appears to daunt. However softened or concealed for political purposes, the defeat of the British troops by the Burmese in 1824, on the plains of Ramoo, must be fresh in the recollection of the public, and their occupation of the lower part of the province of Chittagong for six months in defiance of the British power: from this they afterwards withdrew, only to meet the war we had commenced in Ava. The desperate and arduous contest we there entered upon, occasioned not only a most deplorable loss of human life, but a sacrifice of twelve millions and a half of English money. The sanguinary conflicts between the British troops and the Nepaulese in 1813 and 1814 cannot be forgotten, nor the extreme difficulty with which we maintained our footing in the country we had invaded. The affair of Kallunga, where General Gillespie fell; the defeat and retreat of General Sullivan Wood with dreadful loss, from before the stockade at Bootwah; the massacre of Captain Blackney and his detachment of 300 men at Summonpore; the murderous attack upon Captain Sibley at Pursa Gurry, when he was killed, and his detachment of about 400 men nearly annihilated; are so many instances in proof of what the Nepaulese are competent to do, and may be received as no slight evidence of the probable effects of combinations such as that to which we refer.

Looking to the north-west of Hindostan, we find every indication, at no very distant day, of conflicts which our friend and ally, Runjeet Sing, whose dominions skirt our frontiers, will be engaged in with the northern part of India, threatening the most disastrous consequences, and to lead in all probability to an extensive invasion of our possessions; an invasion, the results of which

must be considered very doubtful, encouraged, as it is believed to be, if not positively supported, by Russia. Certain it is, that Russia, in 1819, sent an expedition *en route* to India, to see if it were practicable for an army, conducted upon the principles of modern warfare, to cross the Indian Caucasus, or the great range of northern mountains. The report was favourable to the enterprise. At the present moment there has been another Russian expedition sent to Khiva and Bokhara, with the possible object of surveying the territories comprised between the Oxus and the Caspian Sea.

At the fair of Niznei Novogorod, where the Emperor of Russia was present, his majesty "summoned many of the chiefs from eastern countries, and those from Cabool, Candahar, &c., were treated with great honour." Now we find also by the Delhi Gazette, that Dost Mahommed Khan, the chief of Cabool, was making every preparation for carrying on a war against Runjeet Sing, and of which he had given due notice to the Nazims of Peshawar. It appears that Dost Mahommed Khan, very recently, with a naked sword in his left hand, and the Koran in his right, had walked into the Choke Bazar of Cabool, where all the principal inhabitants were assembled, and declared to them with tears in his eyes, that "formerly he fought with Runjeet Sing for the sake of his country; but now he must fight for religion; therefore, if he failed in the war, their religion would be polluted by Kaffirs (Christians)." It seems that the multitude in reply told him, to "take the field against Runjeet Sing, and they were all ready to follow him."

It would by this appear that it was a religious crusade these barbarians were about to wage against Runjeet Sing, with whom it is more than probable the British will be obliged constantly to unite in offensive operations, to prevent, if possible, the evils from extending into their own dominions.

It is with very great reluctance that we refer to these events; but it is only by an exposure of the truth that we can hope for remedies to be applied to the evils. We must, however, reluctantly confess, that we look with despair for any such effort from the present ministers of the crown. Ever since the Whigs have been in power, our Asiatic dominions have been placed in great jeopardy by mal-administration. The only rule and order, as far as we have been enabled to trace their deeds, has been a total disregard of the civil rights of the community, and a callous infringement upon the rights of our neighbours, with an indifference absolutely monstrous, for solemn and

heretofore binding treaties. Of the former we have a conclusive sample in what is called Mr. Babington Macauley's 'Black Act,' which, Sir John Cam Hobhouse says, "had not been adopted by the Governor-General of India,—but circulated through the Presidencies in order to obtain the opinion upon it of those functionaries who were best able to judge of its merits."

This is certainly one of the many strange and incomprehensible official declarations of her majesty's present ministers, which really makes honest men blush at the apparent total disregard of truth.

Just so, also, Sir John Hobhouse with regard to his declaration, that the *Black Act* "had not been adopted," while we have the astounding fact that it was published in "*The Calcutta Gazette*," as to be in full force "*from the 15th day of November, 1837*;" and after which day it was ordained "*that no native of India shall quit the territories under British rule without an order from the government.*"

The ministers of the crown might well be ashamed to avow giving countenance to this atrocious "*New Penal Code*," which goes to make virtual prisoners of one million and twenty thousand of British subjects in Asia, as well as to subject Europeans all over the country, to be tried by black judges, without a jury, for all sorts of offences,—and according to their caprice or judgment, the former may be imprisoned for years or transported to a penal settlement, or even banished for ever from India. They are, it is true, to be tried by British law, but this is a mockery; for of the elements of it, or of the law itself, neither the black judge, nor the black counsel, know any thing. We may analyse this law at a future period, and endeavour to expose some of its most monstrous absurdities and oppressions.

To revert to the subject from which we have digressed, the Oude affairs;—and in which the conduct of her Majesty's ministers, as far as we can judge from the documents which Sir John Hobhouse, most reluctantly, consented to lay upon the table of the House of Commons, appears in a very exceptionable light. Instead of manfully avowing the orders and instructions which were sent out by the Board of Control to regulate the succession to the throne of Oude, and also for the seizure upon the remaining territories of that king, guaranteed to him under a solemn treaty in 1801, when the reigning sovereign ceded one half of his dominions as the condition upon which himself and his heirs should be secured in their possession of the remainder, Sir John Hobhouse has produced a variety of papers which go to implicate the

British residents at Lucknow, and also the Governor-General, in transactions of a remarkable and suspicious character; and which, if the documents that have been withheld were produced, might be traced perhaps to a higher quarter. Orders were sent to India authorizing the seizure of the territories of Oude; the production of those orders has been declined by Sir John Hobhouse; and through fear and shame the Board of Control have refused to ratify the treaty concluded under them with the new King of Oude, by the Governor-General of India, and acted upon by the latter. If the Board of Control were really free from all participation in the terms of the treaty with which they repudiate all connection, why have they not instantly recalled Lord Auckland from the seat of power? Why allow him to continue to discharge the functions of so high and important a trust after he stands so lowered, if not debased, in the minds of the Indians by the act of his own servant?

With the question as to who is the legal heir, whether as regards the succession according to Mohammed or English law, we need not enter upon it now. But we must direct the attention of our readers to the monstrous fact, that the present reigning sovereign of Oude was dragged out of his bed in the middle of the night, and compelled, as the terms upon which he should ascend the throne, to sign a "deed of engagement," in which he says, "*I hereby declare, that in the event of my being placed upon the throne, I will agree to sign any new treaty that the Governor-General may dictate.*"

Probably the history of the world cannot produce so remarkable an event upon the succession of a sovereign to a throne, or one that has been in its execution, so replete with calamity as this most atrocious proceeding.

We need not enter into details of a transaction that has so justly created astonishment in the mind of every one acquainted with the circumstances even as detailed in the statements made by Colonel Low, the acting resident in this business. The sudden death of Nusseer-ood-deen-Hyder induced an attempt, on the part of his widow, to seize the crown for an adopted grandchild. Colonel Low, informed of the circumstance, instantly determined upon placing the present occupant on the throne of Oude; and we give merely the extract from the parliamentary papers of the unconditional terms.

"*Translation of a Deed of Engagement, executed by Nawaub Nusseer-ood-Dowlah, on the Night of the 7th July, 1837.*"

"Lieutenant-Colonel John Low, the resident, has apprised me through Lieutenant Shakspeare, his second assistant, of the

death of Nusseer-ood-deen-Hyder, King of Oude. The resident has also communicated to me the substance of the orders of the Government of India, respecting the necessity of new engagements on the part of the Company's Government with the Oude state; and I hereby declare, that in the event of my being placed on the throne, I will agree to sign any new treaty that the Governor-General may dictate.

(True translation.)

(Signed) *J. Low, Resident.*

N. B.—At the foot of the Persian paper the present king wrote the words 'Cabool wo Munzoorust,' and affixed the impression of his seal.

(Signed) *J. Low, Resident."*

The minute of the Governor-General Lord Auckland while approving the promptitude and decision evinced by the resident generally throughout this affair, and the violent proceedings that ensued, yet has expressed doubts as to the propriety of the particular act of requiring the engagement. We quote the passages from his lordship's minute.

"I would not, without further consideration, and on the very brief notices which we at present possess, venture to express any final opinion on the important events which have taken place at Lucknow; but I am prepared at once to approve and sanction the general policy which Colonel Low has followed in admitting the claims of Nusseer-ood Dowlah to the throne of Oude. The title of that prince to the sovereignty appears, according to the most established rule of succession in the Mahomedan law, to be indisputable, and by those rules it is most fitting that we should, in the present instance, be guided.

"I will take an early opportunity of submitting to the Council the ulterior measures which in my opinion should be adopted. For any criticism in detail on the measures adopted by Colonel Low, we must wait for further accounts, but I may now say that I should undoubtedly have been better pleased if he had not, in this moment of exigency, accepted the unconditional engagement of submissiveness which the new king has signed. This document may be liable to misconstruction, and it was not warranted by any thing contained in the instructions issued to Colonel Low. The views of his government, as but recently expressed to that officer, are defined and moderate, and from this circumstance, as well as from the new king's character and position, there could in any case have been little doubt of his willingness to adapt his conduct to those views."

The death of the late king was sudden, it appears, but he had long been ailing; and it does seem not a little singular that no preparation for the event, so momentous as it proved, should have been made in the councils of the Governor-General; for had such

been the case, Colonel Low would not have been driven to the fatal expedient of treating in the name of Great Britain a friendly sovereign as a mere slave, glad to obtain promotion on any terms required by his masters. If the engagement was in truth not warranted by the instructions, as Lord Auckland specially declares, and if the views of his government are so "defined and moderate," as stated, it seems strange that Colonel Low should neither have understood their definiteness nor suspected their moderation, though he was the person principally concerned in keeping these points in view. Was that otherwise able and meritorious officer unapprised of these official facts? Was he led by previous experience to imagine and attribute very different views to the Indian government? Or did he, which is scarcely possible, choose to fly in the face of ALL instructions.

If the latter, by any strange hallucination, was really the case, we would fain ask whether sufficient time had not elapsed since July 11, 1837, if not before it, for Lord Auckland to have expressed something more than the hypothetical feeling of being better pleased if an act contrary to all "defined and moderate views" had not taken place? And here we would inquire, has so flagrant a breach of affirmed instructions been repudiated on his lordship's part? Lord Auckland's personal character and amiability are well known, but it is not a case of mere feelings; his public duty to the government and the country, whose fame is tarnished by so flagitious a precedent in political affairs, required a far stronger mark of disapprobation than his Minute, referred to, contains; the more since, as he observes, the new king's character and position left little doubt of his willingness to accede to moderate views, if required of him.

But the proceeding so gently and gracefully censured by his lordship is nevertheless accepted by him also. Yes, the Governor-General of England in India, declaring a proceeding suspicious and unwarranted (it must be allowed this is done most delicately) yet makes himself a partner to that suspicious and unwarranted step in preference to the "defined and moderate views" he had entertained, and with such singular, disinterested felicity, until the moment arrived for gaining more by the contrary course. "Fortunate senex! ergo tua rura manebunt."

It is, or at least used to be, generally considered that the higher, as well as the inferior, appointments of the British government imposed as the first necessity the maintenance of the metropolitan country's honour:—we have recently, however, been blessed with an example or two of the freedom of great

functionaries abroad from the responsibilities of abusing or deserting their trust. Consequently, in the instance before us, not only is the actor in this asserted unwarranted course retained in full favour in his office, but the very superior who first saw and pointed out the dishonour and disobedience of the act, and then abetted it, retains also his appointment by the favour of the ministry at home.

"Forgad—this is a better song than the other!"

It is assuredly far from our wish to ask any unpleasant questions, and we shall carefully avoid them; we therefore entirely repress our curiosity to know,

1st. How the resident, evidently an able man, came to misunderstand or defy his instructions.

2d. How the Governor-General could at once censure and adopt the engagement.

3d. Why the ministry at home should acquiesce in these two extraordinary and contradictory acts—and not recall the self-condemned Governor-General.

More than all, we should like to be informed who issued the aforesaid recent instructions, and whether any others, of a different tendency, had been given out from any quarter. In fact, whether the views so happily emphasised as "but recently expressed" had been preceded by any thing less "defined and moderate."

We abstain, however, from all interrogatories, because any thing like an opposition between public orders and declarations and secret dispatches is not to be thought of, unless in the case of Jesuits, or of the Russian government: and our admiration at the magnanimity wherewith the poco-curante and poco-sapiente ministry behold the injury inflicted on the national reputation by such deeds, is equalled only by our reverence of the resignation with which they submit to receive every advantage that can be obtained by any means. With so acquiescent a disposition on their parts it may be pleasant for the new King of Oude to know that—

"It will be matter for our consideration, in what manner some modifications of the existing treaty shall be framed, under which the British Government might have more power to prevent or remedy mal-administration, and by withdrawing from the obligation, still existing in terms, although it has long ceased to be recognised as binding in practice, of exercising a complete and minute interference by means of its own troops, in defence of the Oude government, be less liable to responsibility for all its acts, and the ordinary course of its internal policy, and this with increase of ad-

vantage, rather than injury, in rendering disposable our own military means, and without admitting, on the other hand, the formidable growth of an armed and unchecked independence.

"The occasion for some modifications of the existing treaty is most favourable; the late treaty has been too constantly disregarded by the sovereigns of Oude, in their continued and most embarrassing rejection or evasion of all our advice for the good government of their country, not to justify us, if it should seem expedient, in insisting upon our placing the right of acquitting ourselves of our responsibility upon a clear and admitted basis, and we may avail ourselves of the opportunity offered without reproach or suspicion, provided that our efforts are faithfully directed only to objects of security, and tranquillity, and good government, and are without the taint which schemes of acquisition in money and in land would give them; schemes as repugnant to my own designs and feelings, as they have been ever disavowed by the honourable Court, and by each successive Governor-General, in discussing the grave question of the position in which events have placed us, both towards the Oude ruler and people.

11 July, 1837. (signed) *Auckland.*"

This reluctance to interfere upon "our responsibility," the determination "of acquitting ourselves of it," and this horror of the "taint which schemes of acquisition in money and in land" inspire into each successive Governor-General is easily intelligible. The repudiated act of Colonel Low renders the "scheme of acquisition," of the latter superfluous; and the "repugnance of Governors-General" to schemes of acquisition of the former is really touching; and considering the state of that unhappy treasury of Oude, it was also well-timed: though after reading the following extracts from older documents we ought, but for this avowal, to have suspected that the real repugnance had previously been to leave any thing in it.

The Oriental Herald, a publication of extraordinary talent and interest, in a notice of a recently published work contains this passage:—

"In the private letter of Colonel Baillie* to Mr. Edmonstone, dated 19th October, 1814, which from its contents was evidently never intended for publicity, and which never would have met the public eye had not dissension appeared in the camp, are to be found the following words, and they are a text on which much might be preached:—'I was desired to propose to the Nawaub that his Excellency should propose to Lord Moira to make a voluntary loan to the Company, of a sum of a crore of rupees.

* English resident at Oude.

This having been done, his lordship, in a letter to the Vice President in Council, dated 29th October, says, 'At a subsequent conference, his Excellency *solicited* my acceptance of the sum as a free gift;' and again in the same letter, 'His Excellency the Vizier tendered to me as a proof of his friendship, and the cordial interest which he feels in the prosperity of the Honourable Company, an accommodation of a crore of rupees.' These are the secrets of the prison-house and with a vengeance, and a fine specimen of the voluntary principle they are. Du Val, the highwayman, was a joke to the most noble the Marquis of Hastings, though his words may bear something of the same sort of interpretation."—*Or. Herald for October*, p. 329.

This, be it observed, occurred in October, 1814, and we extract the fitting sequel from the book itself under review, the work of Captain White, who has the merit of bringing these singularly honourable proceedings before the public at present. Quoting from a letter referred to, the author observes, speaking of the then Vizier Sovereign of Oude—

"Saadut Alie, having been '*driven*,' as Lord Hastings says, to '*actual desperation*' by his lordship's letter, had been soothed down by private communications, that the loan of a million and a quarter sterling would make him good friends with his lordship. His lordship, no doubt, was well pleased with this, as it avoided his '*being forced in self-defence to possess himself of Saadut Alie's dominions and riches*.' The English of which is, that as there was no money in Calcutta, or in any of the local treasuries, he must have it wherever it was to be found, either by stratagem, fraud, or force.

"It is rather important here to show how these far-famed '*voluntary loans*' of Lord Hastings were obtained. We have already seen how the first million and a quarter was obtained; let us take a slight glance at the manner in which the second was procured, as well as how the first was disposed of the moment it was obtained. Upon the latter point his lordship, being upon remarkable good terms with himself, says—

"My surprise is not to be expressed when I was shortly after informed, from Calcutta, that it had been deemed expedient to employ fifty-four lacs of the sum obtained by me in discharging an eight per cent loan; that the remainder was indispensable for current purposes; and that it was hoped I should be able to procure from the Nawaub Vizier a further aid for the objects of the war. This took place early in autumn (1814), and the operations against Nepaul could not commence until the middle of November, on which account the council did not apprehend my being subject to any sudden inconvenience through its disposal of the first sum. Luckily I was upon such *frank* terms with Nawaub Vizier,

that I could explain to him freely my circumstances. He agreed to furnish another crore of rupees; so that the Honourable Company was accommodated with two millions and a half sterling upon my simple receipt.'

"By this it is clear that the Council of Calcutta, as well as his lordship, were determined to plunder the Nawaub of every shilling he had." p. 70—72.

The Whig statesman who procured so much money, if not to the honour at least to the *credit* of the British name in India, had not concluded his manœuvring.

"Mr. Rickets, in December, 1814, writes to Major Baillie to inform the Nawaub of 'the high gratification which his lordship would experience, were the Nawaub to prove his anxiety for the British welfare by the tender of another loan to Government,' of a second crore of rupees. Upon the 18th of February he again writes—

"His Lordship is most anxious to hear the result of your negotiation with the Nawaub for further pecuniary aid, as without another crore (£1,250,000) Government may experience the most serious embarrassment.'

"Upon the 19th Major Baillie replies—

"I have at length obtained from his Excellency a direct offer of fifty lacs of rupees, in a letter addressed to Lord Moira; and I assure you, with great truth, that this offer had been obtained with a difficulty which induced me more than once to despair of the smallest success to my labours. His Excellency has been led to entertain notions of our Government very opposite to the professions of disinterestedness which I was in the* *habit of conveying* to him about the time of his accession to the musnud."

This, as our readers will perceive, was not only unfortunate but unreasonable; though appearances might perhaps have been deemed somewhat suspicious: the good major, however, indignantly proceeds—

"Some miscreants have endeavoured to persuade him, that the object of all our proceedings is to plunder him of his wealth, and, when he has no more money, to take his country; and that his minister is in league with us to this end."—p. 72.

Captain White's narrative thus proceeds—

"The offer of fifty lacs was promptly refused by Lord Hastings. Major Baillie was directed to try again his '*admirable skill*,' to state any thing and every thing he could think of to induce the usurper, as '*his tendering further pecuniary assistance to his lordship at that juncture would be most thankfully received by his lordship*;' and that '*the money would be merely wanted to meet the present exigency*;' and he was

* These italics are ours.

instructed to state, that he knew 'his lordship would only accept it on the condition of its being received as a temporary loan, payable, with interest, by kists (instalments) in two, three, or four years.' 'The times are, in truth,' says Mr. Rickets, 'most critical. There is no hope of subscriptions to a six-per-cent loan; and to open a public loan on higher terms would be a most unjust and unwarrantable procedure towards the six-per-cent creditors; and yet, according to a statement just received by his lordship from Mr. Edmonstone, nearly three crore of rupees, in addition to our surplus revenues, will be required to meet the war extraordinaries up to the 30th of April, 1816.' 'Therefore,' says Mr. Rickets, 'unless you can enable me to rejoice his lordship by informing him that you have succeeded in getting another crore of rupees from the vizier, fifty lacs from the Begum, and fifty lacs from your monied men, we shall be in a very deplorable state.'—pp. 72—73.

We find further—

"Major Baillie, in reply to Mr. Rickets' demand, stated it 'to be expedient, if not indispensable, that a letter from Lord Moira to the Vizier, in answer to that which had made the offer of the crore of rupees, should be written to enable him to commence the negotiation for another crore.' Major Baillie then suggests a variety of excuses for his lordship to make; and he says—

"A letter of this kind, I am certain, would have a much greater effect on his Excellency than any representation on my part without such introduction on the subject. It would show his Excellency at once that the obligation which he has the means of conferring is to be conferred upon the Governor-General, and it would frustrate the mischievous designs of his Excellency's enemies and ours, who are strenuously labouring to convince him that it is the minister who, supported by me, is gradually robbing him of his money, with the view of obtaining for himself the approbation and support of Lord Moira, and of exhausting his Excellency's sources of independence and power, which those miscreants represent to him as consisting exclusively of his wealth.'

"Mr. Rickets instantly replied, 'His lordship is so sensible of your thorough knowledge of the Nawaub's character, and so confident in your judgment, that he has no hesitation in adopting the opinions which you may form of the mode best calculated to secure the object in view.' A letter was accordingly written; but what the contents were we know not; it does not appear upon record. It is sufficient that, in a few days, Major Baillie wrote, 'At length, my dear Adam, this most arduous and vexatious negotiation is brought to a happy conclusion; a complete crore of rupees is secured by the letter this instant received.' 'My dear

Baillie,' says Adam, 'I have little time to write; but I must congratulate you on the success of your efforts to get another crore from his Excellency. *It must have been a most ungracious* task.*'—pp. 74—75.

A somewhat similar repugnance to supplies from the treasury of the Nawaub Vizier of Oude was manifested more delicately by one of the "successive Governors-General," who, however, satisfied himself, among other schemes of praiseworthy economy, with merely quartering upon Nusseer-ood-deen Hyder any person whose claims might be inconvenient, or whose residence expensive at the Court of Calcutta. The enlarged intellect and commensurate wants of the Marquis of Hastings could act only upon a scale of grandeur: the peddling and narrow spirit of his successor lived to display itself only in minor cases and with a sedulous addiction to political economy. Painters, artists, and even publications of serious expense were recommended from time to time to the munificence of the native prince; and not to particularize the former, we shall merely allude to the edition of the great Persian historical poem of Ferdousi, which after thirty years, labour on the part of its learned and sagacious editor, Major Macan, saw the light only through the liberality or weakness of the King of Oude, when the Anglo-Indian government had refused to incur the expense!

The magnificent disclaimer of the present Governor-General, above cited, does not quite agree with all the facts, either preceding or subsequent to its publication. We refer to the order put forth by the British resident at Lucknow and published in the Delhi Gazette, February 21, 1838, as quoted by Captain White (Prince of Oude, p. 158, 159), respecting the levy of the auxiliary force in the dominions of that prince: the English thus are absolute masters of the country, though in the treaty signed by the Marquis Wellesley, 1801, it was definitively stated that, upon certain concessions then made, the British should advance no further claims whatever upon those dominions.

Lord Auckland is particularly unfortunate in his public documents, when he so loftily disclaims on the part of successive Governors-General any desire of aggrandizement. His lordship could not have had the following document before his eyes. It speaks for itself of the treachery we denounced in a preceding number (October, 1838), on the conduct of the Marquis of Hastings: and

* These italics are ours.

be it observed that this is the latter's own statement of his own conduct.

"There is, however, in India, a principle capable of superseding the most thorough conviction of interest, or even the strongest personal wishes. Certain acknowledged public obligations are held by the Native Princes so binding on what they call their Hormut, or plighted honour to society, that no consideration can induce them to palter with the constructive pledge. Among these were the professed, though antiquated dependencies on the house of Timour: the Sovereign of Oude was the nominal Vizier of the Mogul Empire. Perhaps the only pretence which any forecasting enemy can have imagined likely to awaken sensation would be the restoration of efficient rule to the house of Timour. While such a war-cry would have been a call on the fealty of the Sovereign of Oude as professedly Vizier of the Empire, the claim upon him would have had the additional force of an ostensible Mahomedan cause. To break ties which might eventually be so injurious to us, appeared to me to be of the highest importance. * * * * I had often ruminated on that chance. I thence eagerly availed myself of a mortification, which I could perceive the Nawaub Vizier felt acutely from its having occurred within my sight. Two brothers of the King of Delhi resided at Lucknow, supported by allowances granted partly by the Honourable Company, partly by the Nawaub Vizier; notwithstanding their partial dependence on the latter for subsistence, etiquette assigned to them in the street, [*sic*] it was incumbent that the elephant on which he was riding should be made to kneel, in token of homage. It was to an occasion of this sort that I have just alluded; I caught the opportunity of saying to the Nawaub Vizier, that to continue such demonstration of inferiority must rest with himself alone, for the British Government did not require the manifestation of such submission to the Delhi family, and *had itself dropped those servile forms*, with which it had heretofore *unbecomingly* complied. Having reason to think that this *instigation* would work upon the Nawaub Vizier's reflection, I directed the resident (Colonel Baillie) to watch and encourage any apparent disposition in that Prince to emancipate himself. The mode which would naturally suggest itself to the Nawaub Vizier, as being the only one sufficient to account satisfactorily to India at large for his rejection of future prostration to the house of Timour, was his assumption of the Kingly title. It was likely that he would distantly sound the Resident on the subject. I therefore instructed the latter, that were any supposition of the sort hypothetically thrown out, he should seize it, and bring it immediately to a distinct understanding; intimating his persuasion that the British Government would readily recognize such a title, if assumed by the Sovereign of Oude, provided it made no change in the

relations and formularies between the two states, or altered the manner in which British subjects, permitted by our Government to visit Lucknow, had hitherto been received. The expected procedure took place. The Sovereign of Oude's assumption of the title of King, was treated by the Court of Delhi with undisguised indignation. The offensive animadversions were keenly resented by the Court of Lucknow, and an irreparable breach between those two Mahomedan States is avowed."—*Pr. of Oude*. pp. 115—117.

We think nothing attributed to Russia or to France can equal, certainly exceed, this course of treachery and treason to an ancient and helpless ally, the Mogul Emperor: comment is superfluous.

Having been careful to select only such facts as are borne out by the confession of the parties themselves, or by official documents, we are the less disposed to concur with Captain White in the censures passed without such precaution. Thus, for instance, his allusion to the conduct of the late Sir John Shore (Lord Teignmouth) is more than open to question, since at the time it occurred it was fresh upon the public mind; an attempt to throw a slur upon that conscientious functionary was preparing, but was met with so much promptitude of explanation and defiance that even the puny adversaries whose ignorance was equalled only by their malice, durst not bring forward the question. We need not therefore recur to it further than to wish that Captain White had used more caution in this case. We have in our hands the memorandum of a gentleman long since deceased, whose residence for twenty-seven years in India enabled him to judge, and whose own honour and integrity, acknowledged by the offer of three successive re-appointments after his retirement from thence by the East India Company in England, and still more unquestionably by the native as well as British residents in his own neighbourhood, and where he held one of the highest offices in the company's gift, is the surest guarantee, if any such could by possibility be needed, for the perfect blamelessness, the high worth, and anxious and pains-taking integrity of that nobleman. It was written long after interest could possibly actuate; long after the testimony could ever come to the ears of the exemplary deceased. It runs thus:—

"These gentlemen (the accusers) are anxious only to prove they know nothing whatever about what they are cavilling at. There never was a more honest, just, impartial, and strictly conscientious man than Sir John Shore; and the pains he took to

sift the question showed him desirous only to do justice to every-body."

We shall notice only, in favour of our argument respecting the flagitiousness of the proceeding, not yet, so far as we know, explained by Lord Auckland or the ministry to the British parliament, three opinions expressed by gentlemen in situations *subordinate* to the Governor-General, and guarded accordingly.

"MINUTE.

"I concur with the right honourable the Governor-General in the views stated in the foregoing minute, with exception of that part of it which disapproves of Lieutenant Colonel Low having taken the agreement (of which he has sent a copy) from the new King of Oude. The moderation which it will, *I have no doubt*, be the object of Government to observe, in any new arrangement with that state, will only be the more conspicuous after this occurrence, which I think calculated to prevent much intrigue, and perhaps painful discussion. It is also in my mind a matter deserving of high praise that the resident at such a moment should have shown himself so fully alive to the public interests; besides Colonel Low seems to have followed the rule similar to that which was ordered by Government on a former occasion; see Colonel Baillie's despatch of the 12th July, 1814, announcing the demise of the Vizier.

11 July, 1837. (signed) W. Morison."

Copies of the Minutes of the Governor-General, &c. ordered by the House of Commons to be printed, 17 July, 1838.—p. 14.

As this Colonel Baillie has already figured in our article, our readers may fairly suspect the value of his example; if indeed the allusion be not a covert satire upon his imitators, in the shape of special pleading.

"MINUTE.

"I concur in the sentiments expressed by Colonel Morison. Every allowance must be made for the hurry and confusion which prevented any deliberation as to the nature of the engagement required from the king; the more general the terms, the more was left for the Government to deal with the question according to its own views, while any specific conditions might have led to embarrassment.

11 July, 1837. (signed)
Idem, Ib. H. Shakspeare."

If the terms were so general that the Governor could deal with the question just according to his own views, we know nothing more illustrative of our opinions. A third minute is still more decisive, if possible.

"MINUTE.

"I do not feel prepared to give a decided opinion as to the policy of placing Nusseerood-Dowlah on the throne of Oude. If,

being the paramount power in India, we are responsible for protecting the people of Oude from the evils of bad government, the policy of the measure may be very questionable.

11 July, 1837.

(signed)

Idem, Ib.

A. Ross."

For the various particulars of the question of succession we refer our readers to Captain White's volume and to the able and judicious article in the very valuable periodical* we have quoted, displaying a sound acquaintance with the particulars and general principles of the case, and of Indian affairs at large.

Our remarks have run to so great a length that we regret that we have so little space to spare for the notice of a work of first rate importance to all who would wish to understand the real state of India. The character of the natives, of the English government, its political and judicial administration, its assumption of unjust powers and constant interference in the domestic concerns as well as the public sway of the native princes; the value of the territories held by the latter, the mode of their rule, and the oppressions they suffer, under the name of support, from the British government; in short every detail of any importance in the political system of Hindostan is here laid down with a bold and vigorous hand. The author, a younger son of the late Lord Teignmouth, and himself unfortunately removed by death from a sphere where his talents and hereditary judgment, his clear-sightedness and freedom of thought and language rendered him invaluable as a firm and resolute foe to abuse, has yet left to his native country a noble legacy in the work before us.† Amongst the advantages of high birth and station it is not the least that it creates a factitious feeling to aid and support the moral elevation of the mind, and if it does not altogether bestow, it at least cherishes this in the earliest stage of its existence: it is the very poetry of caste: not pride, but a nobler sentiment, a sense of in-born superiority to the sordid and grovelling portion of our nature, to the baser suggestions of want and accident, to the tortuous windings of sinister interests, to all that in the intercourse of life perverts and pollutes the fountain of Being, from its very source through every channel that might otherwise purify society. In some instances, it is true, it suffers deterioration, but not so frequently

* Oriental Herald for October, 1833.

† Notes on Indian Affairs. By the Hon. Frederick John Shore, Judge of the Civil Court and Criminal Sessions of the District of Furrukhabad. In two volumes. London: Parker, West Strand. 1837.

as the envious would imply. In spite of the vulgar outcry against rank and title, against an exclusive race, and hereditary honours, these enshrine a spirit that cannot all mingle itself with earth; and dull and blind as utilitarianism can make it, must be the eye that cannot recognise in such distinctions a tendency of the mind, in even the rudest ages of society, to preserve its own aspirations undebased in the spirit of its children, through eternal generations.

The advantage strikes us with peculiar force in the present instance. The faults of the Indian system of government had been often railed at by those who were really, or were liable to the suspicion of being, prejudiced by accidental circumstances; and the very violence and often the hollowness of those complaints had induced a reluctance to give them any credit at all. But the writer before us was liable to no suspicion of low and interested motives; and the frank and polished tone of his animadversions has everywhere produced an effect that was, and would have been denied to angry vehemence. He was certainly one of those to whose efforts was due the praise of rendering the Anglo-Indian government amenable to reason; and though from our preceding strictures it will be seen that the change, even now, has not produced an Utopia, and under existing auspices may still be open to improvement, yet it is much to find with the author that

"A new era seems at length to have dawned upon this interesting country. Public attention has been much more directed, of late years, both in England and in India, to its concerns than formerly. The dislike of our rulers to have matters connected with the subject discussed, appears to have considerably lessened, and it seems to be the general opinion that the publication of temperate remarks, unexaggerated facts, and moderate suggestions of improvements, will be approved of by the public, and meet with attention from the constituted authorities."—*Notes on Indian Affairs*, vol. i. p. 1.

"Ten or twelve years since, had any man in India ventured to publish such strictures on the Indian administration, he would most undoubtedly have been banished the country; and even as it is, the cautious and guarded tone in which the first papers were written, displays a strong contrast to the openness and freedom of those which follow."—*Ibid. Introduction*, pp. vii. viii.

The sound knowledge of, and thorough acquaintance with the subject possessed by the writer are obvious in every page. He seems never to have dreamed, like some sages nearer home, that practice and expe-

rience are derived by intuition; and as his strictures, unlike the generality who have touched upon the subject, were evidently dictated by an honest dislike of measures alone, the very men who originated these were half disarmed of their resentment. We cannot, with our limited space and information, pretend to discuss any one of the questions started by so competent a judge, and on the spot, and we therefore confine ourselves to simple extracts such as may best illustrate the subject of this article.

"Notwithstanding the numerous proofs that have been, and can still be, produced to the contrary, the dissatisfaction of the natives with their own governments, and their confidence in, and approbation of ours, is still maintained. The expedition to Rangoon, during the Burmese war, was undertaken in the full conviction of the existence of this feeling among the Burmese. It was anticipated that no sooner should our troops be landed there, than the people would flock to their liberators, and supply them with boats, provisions, and other necessities, which would at once enable them to proceed to the capital. Yet what was the real state of the case? That to the last moment of our occupation of the enemy's territory, not until driven to it by starvation, did a single Burman hold any communication with our forces. The simple fact that they preferred their own government to ours, was too plain, and too mortifying to be admitted. It was necessary to soothe our vanity, and this was done by asserting that the whole population was driven off by the Burmese troops."—*Notes on Indian Affairs*, vol. i. pp. 150, 151.

"Nor are the Burmese by any means a singular instance in this respect. I have travelled in several independent native states; and I do most confidently assert, that the mass of the people deprecate above all things, their subjection to the British authority."—*Ibid.* p. 151.

"But it will be said, 'Oude is notoriously ill-governed; robberies and dacoities are of daily occurrence; troops are necessary to the collection of the revenue; and, in short, the people are groaning with oppression.' This is the point; by the help of the word 'notoriously,' the question is begged throughout. Let an impartial inquiry be made before it is pronounced that the frequency of crime is greater than in our own adjoining provinces. The fact may be strongly doubted. On the second point, is our assessment so light that no force is necessary for its collection?"—*Ibid.* pp. 154, 155.

"I will conclude by reminding my readers of the answer mentioned by Heber to have been received, by the British resident, from an inhabitant of Oude, whose opinion was asked as to the benefit they might expect from the occupation of the country by the British: 'Miserable as we are, of all miseries keep us from that.'"—*Ibid.* p. 157.

"The prospect of a Russian invasion has been so often ridiculed as a bugbear, that few now allude to it. We boast of the strength and efficiency of our army, and triumphantly ask, What can Russia hope to be able to bring into the field to cope with it at such a distance from her own territory and resources? Were this the only question, we might safely treat with contempt any effort of Russia. Were we safe from internal commotion, we might indeed bid defiance to any external enemy. But this is *not* the only question; many other points are to be considered. What portion of our numerically large army could be concentrated on our north-western frontier? How many of our districts could we venture to leave without troops? What cavalry could we bring forward to keep in check the thousands of Persian and Cabul horse, whom the hope of plunder would induce to accompany them, and who, with a disciplined army to serve as a nucleus, would scour the country in every direction, destroying what they could not carry off, cutting off stragglers and foraging-parties, and intercepting convoys of provisions? Lastly, what force would be required to keep down the disaffected in our own provinces, who would be hovering round every detachment, killing every man who strayed beyond his pickets? Thousands and thousands of our own subjects would be employed in this way, and I have heard many intelligent men assert that, were a body of thirty thousand disciplined Russians to reach the Sutledge, and avoid an immediate conflict, we should not call a foot of ground in Upper India our own, but that on which our army stood; and that our troops would starve in their camps, or be destroyed in detail in attempting to procure provisions, or be driven by necessity to desert our standards; and that in a very short time the British power would no longer be known in India. I think there is ample ground to justify this opinion. The disaffection to the English government I know to be at a most alarming height; and with any prospect of success from external assistance, it would rise up with an overwhelming force."—*Notes on Indian Affairs*, vol. i. pp. 166, 167.

The half-exploded system of the Turkish Pachas has been carried on to great extent in India.

"Here every district (out of the limits of the permanent settlement) has been like an apple in a cider-press, while the collector turns the screw; and, when he has squeezed it to the extent of his power, makes over the handle to another; and he to a third; and so on. A collector is in various ways made to feel that his reputation and prospects depend upon his realizing a large revenue; and that a recommendation for a reduction in the amount of the assessment is only considered in the light of a register of his own inefficiency."—*Ibid.* vol. i. p. 171.

The sagacity that introduced the use of Persian in the law-courts and now would substitute English for it amongst the natives is satisfactorily disposed of.

"For what is proposed? Actually to attempt to teach a hundred millions of illiterate people (the greater part of whom are so poor, that labouring, as they do, from morning till night, a bare subsistence is all they are able to procure,) to acquire a foreign language; instead of obliging a handful of foreigners, all of whom more or less are men of education, and who, at the commencement of their career, have considerable leisure at their disposal, to learn that of the country under their authority."—*Ibid.* vol. i. p. 211.

The similar wisdom that would fain invent a European character for Asiatic language is no less fairly put down.

"They quite forget to take into consideration the inconvenience to which so many millions of natives would be subject, in being obliged to learn a strange character."—*Ibid.* vol. i. p. 216.

"What would an Englishman do in France, Germany, Russia, or any other country in which he had engaged in mercantile affairs? He might as well complain of the hardship of being obliged to transact his business in the language of those countries. It is the same in India. The number of English merchants and tradesmen (and there are no others) all over the country, out of Calcutta, amounts to a few hundreds. Who obliged them to come here? What brought them here?"—*Ibid.* vol. i. p. 217.

The activity of justice under the old system is thus exemplified.

"From Almorah a case of murder was once referred to Government, for orders, and no answer was received for two years. The same occurred under a similar reference, at Assam, in which the answer was not received for three years. In October, 1829, two cases of murder were tried by the commissioner of the Furruckabad division, and referred to the Sudder Nizamut, from which court, up to the end of 1832, no orders had been received. It is often that several months, or even a year elapse before any orders are received in criminal trials referred to the Chief Court: indeed, it would appear, from their own proceedings, that such delay is not uncommon. In 1816, a circular order was issued to the circuit judges, directing them, whenever six months had elapsed without any orders being received, upon trials referred, to report the circumstances, and refresh the memory of the superior court. The same order was repeated in 1827. During all these delays, the *prisoners remain in gaol*. Since the establishment of the branch court, at Allahabad, however, a great improvement for the better has

taken place on this head.”—*Notes on Indian Affairs*, vol. i. p. 256.

“In an official letter, already once quoted, Mr. E. Strachey, among other reasons for not writing a detailed report, mentions that he had 400 prisoners untried, and 1700 witnesses in attendance, whom he could not keep any longer from their homes.”—*Ibid.* vol. i. p. 496.

Upon the constant and erroneous assumptions of ignorant persons we have the following, which may serve as a hint not to credit too lightly errors of higher importance than those as to usage.

“The constant misapprehensions and mistakes which are made by the English, from mere want of observation, are astonishing. For instance, the majority of the inhabitants of Bengal and Orissa do not eat meat. This has been ascribed to a religious precept against destroying animal life, and they have received abundance of praise from their admirers for their humanity. Yet almost all, of whatever caste, constantly eat fish. The probability is, that the custom of not eating meat had its origin in poverty, and has been confirmed by habit; which is by no means a far-fetched supposition. Many of their most rooted customs have no better foundation, or have arisen from accident. Many of the highest Rajpoots and Brahmins in northern and western India will eat goats, venison, and wild hog’s flesh, while they abhor that of sheep, or domestic swine. Some will eat the jungle fowl, (which in appearance is little different from a gamecock, except in size) who would think the touch of a domestic fowl pollution. Most castes will eat some particular kind of food, but refuse others; for which it is impossible to assign a rational cause. At Bickaneer, all Hindus profess a whimsical abhorrence of fish. In Kumaon, they will eat the short-tailed sheep of the hills, but will not touch one with a long tail. Many classes will eat bread baked by the people, who would lose caste if they were to touch boiled rice dressed by the same hands. Many tribes will allow a man to smoke through his hands from the bowl (chillum) which contains the tobacco, who would not allow the same person to touch that part of the hookah which contains the water. An earthen pot is polluted beyond redemption, by being touched by an inferior caste; a metal one suffers no such deterioration.”—*Ibid.* pp. 532—533.

The remarks on the subject of our interference with the native governments are, however, more germane to our immediate purpose.

“In India we claim to be the paramount power, and to exercise the authority which is usually conceived to be attached to it.

The maxim alluded to is the only possible plea on which we can found such a claim; for no one who has the least acquaintance with the feelings of the people, either of our own territories, or of the neighbouring states, can for a moment suppose that they would willingly submit to our assumption of such authority. Whatever may have been the notions formerly prevalent, late discussions have tended to bring to light the truth; and however unpalatable to our self-love such a conclusion may be, we have been compelled to own that we hold our own possessions not by the good-will or affections of the people, but by an overwhelming military force, which renders resistance hopeless.”—*Notes on Indian Affairs*, vol. ii. p. 71.

“I cannot help here alluding to the feelings which seem to prevail in our view of the conduct of Russia towards Turkey and Persia. The ambitious projects and insidious proceedings of the former power form a theme for eloquent declamation among the English. It is strange that we should be so very sensible to the faults of others, and so blind to our own. The game which Russia has, for a series of years, been playing towards Turkey, is a precise counterpart of that which we have so long pursued in India.”—*Ibid.* vol. ii. p. 72.

“The following summary is quoted from an official memoir drawn up by Major Sutherland, and printed, but not published, by Government, in 1833:—‘There is no state in India with whose government we have interfered so systematically, and so uselessly, as with that of Oude. But this interference has been more in favour of men than of measures; and has apparently been utterly useless for the purpose of securing to the people of Oude any improvement in their institutions, or in the form of administering them. We at one time sent our officers and troops to enforce the payment of the revenue claimed by the Oude government from its subjects, without having the means of judging whether that claim were just or unjust; and we have lent our troops almost for the performance of the ordinary duties of police. We at another time supported a minister in his office, and, during our support of him, borrowed money from the treasury of the state, the interest of which we guaranteed in perpetuity to him and his family, though in lending it he was guilty of betraying the interests of his sovereign. We have at another time withdrawn our troops from the support of the minister, and left him to his own resources. We have on several occasions placed ourselves in the humiliating condition of debtors to the Oude government; we have shut our eyes to the extortions and oppressions which have driven its subjects into rebellion, and then we have lent our army to punish, and reduce them to obedience. But in the whole history of our interfer-

ence, there does not seem to be one measure calculated to produce any lasting benefit to the people of Oude."—*Ibid.* vol. ii. pp. 79, 80.

A note on this point further informs us that

"The right to interfere in the appointment of minister is openly assumed in a letter from the chief secretary to the resident at Hyderabad, dated 31st December, 1809."—*Ibid.* vol. ii. p. 81.

"It has since appeared, by the publication of the minutes in council, that Sir Charles Metcalfe was the advocate of a free press, which he established as soon as he came into power; and that Lord William Bentinck was secretly proposing to keep it under the control of Government, while he was making speeches, and writing letters, professing to be a friend of freedom of discussion."—*Notes*, vol. ii. p. 83.

We find a strong corroboration of an assertion made in the course of this article by ourselves.

"In minor points, who does not recollect the member of our civil service who, after having been dismissed for malpractices, with a positive order from the Court of Directors against his future employment, was sent up to Lucknow with a recommendation from the Governor-General to the king, which the latter considered in the light of a command to give him an official post? Who does not remember the same influence exerted to procure employment, or, in plain English, a pension, for an English singer and his wife, from the unfortunate king of Lucknow? I have myself seen the influence of the resident at Lucknow exerted to induce the king to buy a French toy at a most exorbitant price. The resident himself exhibited the toy, and recommended the purchase; and when we consider the complete thralldom in which the government of Oude was then held by the resident, if this be not direct influence, I know not what is. The same authority has been exerted to induce the king to entertain English coachmen, gardeners, musicians, and all sorts of people whom he had no wish to employ. It is probable, that the convenience which has in this way resulted to men in authority—not even excluding the head of the Government—has been one cause that Oude has so long been suffered to remain an independent kingdom. Had it been annexed to the Company's dominions, all these sort of proceedings would have been annihilated; and whatever surplus existed, after paying the expenses of its management, must have been carried to the Government treasury."—*Ibid.* vol. ii. pp. 83, 84.

Is not this honourable to our forbearance? But the "auri sacra fames" is uni-

versal, from the Government to the revenue collector.

"When a defaulter has a daughter, a person of much lower caste than her family is selected as her husband, provided he be willing to pay a large price. The defaulter is forced to give his daughter's hand to this person, and the money realized from him is immediately seized on account of Government! Any overplus that may remain, after liquidating the demand, becomes generally the perquisite of the revenue officer (tuhseeldar) for his good offices. Such have been the modes in which the Government taxes have been collected in the upper provinces for the two last years."—*Ibid.* vol. ii. pp. 85, 86.

Speaking of the profligate folly of the late king of Oude, Mr. Shore well observes:

"The English government are mainly to blame for this state of things. How is it possible that native princes, who are kept in a state of pupillage, and almost treated like school-boys, should have any self-respect or proper independence of feeling? This has been the case with Oude for the last forty years. Had the British Government turned their supremacy to good account, by insisting on the education of the native chiefs, so as to qualify them for the art of government, this would have been a measure entitled to the highest praise; but so far from it, the interference of the residents has been almost always exerted for evil; indeed, so extremely difficult is it to discover the slightest benefit arising to any class of people from the establishment of residents at the native courts, that there is even ground for the supposition that the measure has been adopted and maintained for the express purpose of promoting misgovernment and confusion in the different principalities, so as to afford plausible excuses and opportunity for our taking possession of them. A species of interference such as that suggested in No. xxxix, would be a real benefit. Lucknow has not, at most, above three or four years longer to remain as an independent kingdom. By that time, the king, if he live so long, will have spent the remnant of his treasure; and as he will not have the sense to reform his conduct, borrowing and exactions will become the order of the day: disturbances will ensue; and the British will settle the matter by taking possession of the country."—*Notes on Indian Affairs*, vol. ii. p. 276.

It is time for the parliament of Great Britain to look to this disgraceful proceeding, and probe it to the bottom if they mean to guard the national fame committed to them. What can other countries think of us, so loud in condemning, if we profit by this act?

"Heaven cannot abide it,
Earth will not hide it."

It would seem by these concluding remarks, that this fearless writer and independent functionary had the sagacity to perceive from afar the coming fortunes of Oude, which took Lord Auckland, or his superiors at home, so strangely by surprise. Mr. Shore, indeed, devotes a portion of his work to discuss the means of benefiting that country, when in British possession. He seems to have appreciated, no less correctly than Colonel Low himself, the exact degree of confidence due to "the defined and moderate views of the government." That two men so different as the Honourable Civilian and the *unwarranted* Colonel should both have so interpreted these views, and interpreted them wrongly, is a coincidence extremely singular, and unfortunate for the character of Britain; and the more so as it shows that the two extremes of opinion, the perpetrator as well as the reprobator of wrong, did, in common as we happen to know with all India, conceive the moderate views of the British Government, when defined at last, to signify simply, TREACHERY and USURPATION.

ART. VI.—*Histoire de la Littérature Allemande, d'après la cinquième édition de Heinsius.* Par MM. Henry et Apffel, avec une Préface de M. Matter. 8vo. Paris, 1839.

It is not very long since, in our 39th number, we noticed with approbation a work similar to the present in its subject and treatment; but the topic is so generally interesting, and the taste for German literature, as it exists at this day, is so widely spread and spreading, throughout our own land and through all Europe, that every notice of its progress in other countries, becomes more and more acceptable to the readers of our journal.

It can scarcely be surprising that the peculiar system of thought and study pursued in Germany should make but a gradual progress amongst the French, their very antipodes in almost every thing, but position. Yet it was the eager curiosity of our more lively neighbours for all that bears the stamp or even semblance of novelty, that at length produced the first overt act of acquaintance with German literature, and its first general introduction, through Madame de Staël, to

the notice of Europe. The beams of the rising sun had, however, penetrated long before through the misty atmosphere that envelops our own insulated comprehensions, when the Sorrows of Werter, the Robbers, and the criticisms of Heyne, excited so strong a sensation, and so much stronger a doubt as to the quantity and quality of reason as developed in the German mind. The rays that reached us were, to return to metaphor, deemed promising in themselves and indicative of considerable power in the planet that scattered them so far; but some doubts were entertained, and not altogether unreasonably, that the mists through which they struggled were not entirely those of English mental obscurity; and that a haze of no ordinary intensity dimmed and concealed the far greater portion of the rising orb of glory in its native land.

We are far from considering this suspicion erroneous; and however long and successfully we ourselves have toiled, with an almost German devotion, for the object of rendering German literature popular here, and transplanting to the best of our means the strongest shoots and fairest flowers of that soil, and importing the lavish wealth of its opened mines of learning to adorn and improve our national mind, we yet are tempted at times to think that the general feeling, and certainly on some points, has run of late too violently into this very extreme; that led and seduced by the labours and talents of some of our own most eminent writers and poets, we have given without due reflection into a species of Germano-mania, and transferred the praise due undoubtedly to their erudition and scholarship, into an indiscriminating admiration for every thing that bears the impress of Teutonic peculiarity of any kind.

That such a state of feeling is a serious error, we do not hesitate distinctly to pronounce. However profound or important a course of abstract thought or inquiry may be in itself, it cannot from its very nature be adapted to the general mass of mankind. It is no answer to say that this mass are not the parties for whose immediate benefit it is intended; and that the stream must first flow through the usual narrow channels of more cultivated intellects, before it can be made available for the world at large. A mental system which requires a long, so to say, chemical process of precipitation, sublimation, and combination with foreign properties before it can be turned to general account, must of necessity be generated by certain peculiarities of home growth: as shadowy, subtle, and meditative, it answers admirably for inhaling in the calm repose and contemplative philosophy of German universities and

abstract speculations ; but brought into contact with the coarser and bolder practicality of every-day life and action in England and the rest of the world, its very subtlety marks a degree of rarefaction unfit for common purposes.

The care that analyzes mental properties into hypothetical classifications and contrasts purely speculative and metaphysical, as if spirit were capable of being fully comprehended by human nature ; and indeed as if mind were utterly independent of matter, and did not exist except by combination with it ; is clearly a labour of excess : the linguist, the man of science who dives into the secrets of nature and the arcana of the past, and is satisfied to live for these alone, must also be satisfied to remain as the miner, the mere pioneer of a more popular and superficial research ; and the poet and the popular writer who constantly chronicles every act and idea that visits him in the retirement of his study and the unvarying routine of domestic life and intercourse, is apt, and with justice, to be regarded by the public at large as tedious or trifling and overlaid with puerilities. It is these qualities in excess that deteriorate the literature of Germany. Her writers are not satisfied unless their readers know all they have done and dreamed in the progress of their labours towards any one point : every portion of their course is held to be of equal importance ; every turn and gesture of the inner and the outward man equally deserving the reader's most anxious admiration : and thus the secluded sage, the man of the closet, comes forth before the world, and begs in the unsuspecting innocence of his literary vanity, that all shall respect his shuffling gait and his night-cap, the slippers and morning-gown he wears in public, because in his study they have been associated with the pen that has wrought so many marvels of intellect.

With these amusing peculiarities and positive drawbacks upon the real value of their elaborate researches, it will scarcely be expected by any but the most enthusiastic admirers of German authorship, that such can escape that strong turn for the ludicrous inherent in the mind of our Gallic neighbours, and not to a certain extent act as a preventive upon the continuous adoption and imitation of German habits of thinking and writing among them. With our own less mercurial and more kindred temperament these habits have largely affected a considerable portion of our writers ; and the very faults and excrescences of German taste have been urged as beauties, and expatiated and insisted upon to the utmost limit of our own reason and forbearance.

In thus unequivocally expressing our opinion as to the absolute defects of the German writers, we must distinctly repudiate any the slightest intention of depreciating the real value of a literature that has made such rapid progress in so short a period, and is daily becoming more important to Europe, having already possessed itself in undisputed sovereignty of the highest classic ground. The very faults indeed of German authorship spring, like all others, from the same source as their excellences ; namely, the peculiarities of their position, political and individual. The abstraction from practical life, that renders them ignorant of how much that each man considers to be his own immediate discovery, is, and has long been, thoroughly known to the world ; so much so, indeed, as to be always taken for granted and to require no announcement ; and the utter unconsciousness of the ridicule that, in more active states of society, follows the minute chronicler of intermediate shades of thought and infinitesimal puerilities of action or emotion, these practical defects also, and at the same time, engender, and are fed by, that insatiable hunger for knowledge, that unwearied labour of examining and exhausting every store of information, which amasses every heap of learning into one huge memorial, as mighty perhaps and scientific as a pyramid, but almost equally hopeless, isolate, and obscure. Digestion sinks in the universality of appetite.

This, the great error of German learning, is nourished by the more natural error of foreign ignorance. We wish to cast no slur upon the former, and little upon the latter ; and therefore, conversing the sarcasm, would say—

Un savant trouve toujours un moins savant qui l'admire,

and to this subject must address a few words.

The German language is in itself difficult, far more so than the French or Southern European tongues ; and its terminology is so various, so compound, and consequently so full of epithets conjoined, that it acts upon the mind through the ear somewhat as the Chinese does through the eye, forming at once in each combination a picture to the sense. But between these two modes a great difference exists : that which is actually pictured in lines acts directly, that which is expressed in words indirectly and through the understanding, upon the senses. The second, then, is a less simple process than the former. A language which admits these combinations of terms, admits also their production to excess ; and in all these the process of the thought that frames them is more

strongly displayed to the reader than the result of that process; as in English. The German gives all the parts, the English the undivided whole. And we cannot wonder at the partiality of learners and students for the former course in preference to the latter, for it brings the reader into the workshop of the writer's mind, not merely into his show-rooms, and has precisely the same effect that he who enjoys the landscape along the road feels, and advantageously, over him who merely travels it. But which more directly reaches the end? He whose mind is, however slightly, yet incessantly and eternally diverted from the right line, or he who proceeds in this simple sense?

It continually happens, too, that this very facility of hinting, rather than speaking out, of intimating imperfectly rather than being bound to definition, prevents the writer from closely attending to the accuracy of the thought, since he can dispense with the precision of the term. The former, in truth, he has only shadowed out, not determined; and hence, as in the Shemitic writing, there is always, doubtless, a meaning, but there is always also a doubt; and when a first-rate metaphysician or poet has written a word, each of his admirers writes a book to inquire what it means. Owing to the different formation of men's minds, every angle from which it is viewed affords a somewhat different combination; it is gold or silver for the tilting knights, and must be settled by the point of the lance; and Goethe himself was puzzled when his commentators proved to him how much he had intended which he never imagined.

This peculiarity of thought and words acts of necessity upon mind and language. The end is lost in the means in both cases: instead of a common tongue, each writer has his own secret alphabet; instead of seizing a thought, and stamping it into a perfect idea, a solid form of judgment obtained from casting down the previous fusion of fancy, we are presented but with the components: it is the analysis given for the result; the anatomy of the body, not the body itself, produced. And in proportion as the plastic power is imperfectly used, the results are likewise imperfect. Like the intellect, too, the language gains nothing definite; no new word, but fresh combinations only of the old: but this is less an advantage than a defect: it may remain essentially German, it never can become universal. It may be less profound than it seems, and it certainly becomes more difficult.

Yet it is this very difficulty that has, in our opinion, obtained for the tongue itself and the writers in it so ample a share of

admiration. Men do not like to throw away their labour; they do not like it to appear thrown away; and when the scholar of German, as of Sanscrit, feels that he has mastered the tremendous difficulties of its highest range, he is not only capable of an enjoyment denied to the many, but he is apt to overrate the new world into which he has entered, and which is the more enticing as it is more subtle and imaginative; ideality rather than substance. The basis of reason upon which life reposes, the practicality, that tests all things in the material world, are left behind him as he enters this dreamy sphere; and he takes the Mephistopheles of subtlety at his elbow for a judge, and the Will-o'-the-Wisp for his guide, and dances through the May-day night of the mountains with the rocky Hartz for the green-sward, and every mocking phantasy for his partner in the maze.

Now there is no occasion for all this: it may be very well for a pastime of the sage; and if our English literary Fausts are determined to do it seriously, let them remember where their prototype finally went, as Marlow and Goethe inform us. There, they may rely upon it, they themselves will follow, so far as this country at least is concerned. England is too practical in all her habits, too constantly kept by her insular position and political system in straightforward vigilance and bold existence, to allow time to any extent for metaphysical niceties. In her constant collision, forcible or friendly, with the whole world, all the currents of thought, all the fancies, cravings, desires, all the elements of material life and action are so unceasingly whirled together, combining and conflicting in the crucible of a positive chemistry, that the lighter vapours, the sublimations and sublimities of alchemical expectations float away into air, the caput mortuum is left at the bottom, and the general extract alone retained for practical purposes.

Nearly the same effect, though from widely different causes, obtains in France; and has prevented, and will probably prevent anything more than a passing mania for German and exotic mystification. It is to this and this alone we refer in our remarks, for it is simply the prevailing tendency to this in German feeling that robs its literature of the due consideration it deserves on many points. The genius of Germany is too vast to be exhibited by the microscope of one portion of its admirers, or puffed by the bellows of another into ballooning it through the clouds: it wants no mists and haze to exaggerate its dimensions; and if it means to meet the sympathies of

man, it must be not ideal but positive ; not confined to its own country by narrow peculiarities, but universal as the globe over which it would range.

The truth of our remarks is borne out in great degree, not only by the fate of those eager enthusiasts of German literature in England, whose praises are heard and suffered to sink in the mysticism that envelopes them ; but also among the Germans themselves. Their warm aspirations for political institutions after the fashion of England or France was the first symptom of the taste for the practical ; and when the leaven is once introduced, even if ill-judgingly at first, it gradually corrects and leavens the whole. An adoption of foreign terms, however few, and a disposition to act upon reasonings instead of abstracting them, is rapidly producing a change in the spirit of the Germans ; whose authorship we trust will soon, as its progress seems to announce, hold another empire than the air, and take its place in the field with England and France for all active purposes, as it has done in speculation.

With this distinct avowal of our opinions, and which if at all novel in print are more especially so in this journal, and yet, so far as we can see, they are fully borne out by, with some few exceptions, the general sense in England ; with this avowal, we repeat, we must couple a reservation in favour of some of the highest names in Germany. The question of classical or scientific literature, we do not touch upon in this paper. Our remarks in truth refer less at the moment to the range of intellect than to the medium of communication ; bearing in mind, however, the connection between the two, and which is so close that the one materially affects the other. Clearness and simplicity of thought will always induce with the least practice a corresponding clearness and simplicity of diction ; and according to the imperfections of the latter we can determine with sufficient accuracy whether the mind that puts it forth is turgid or verbose, confused, multifarious, and indefinite ; inert from indigestion of over-crowded reading, or thinking, or smoking ; elaborately heavy or elaborately light, pompous, dictatory, or finical : the merely superficial seems unknown in Germany ; but this we ourselves can amply supply. The froth and scum of English literature is easily thrown aside, but we cannot so willingly, or so lightly, dispense with the mass of information buried in German scholarship. But the last should bear in mind that all complication is coun-

teractive, and all simplicity energetic in its kind : the five hundred mirrors of the French mechanical experiment could not set fire to a boat at one tenth the distance effected by the single machine of Archimedes.

M. Matter remarks the fact that the southern languages of Europe came into notice long before those of the north. This circumstance was fortunate and was also necessary, as the result, if so alone, of geographical position. Wherever they spread, the northern nations were in earlier ages the predominating race ; and thus they preserved in so great a degree not only their original customs and feelings, but were also enabled to engraft, upon otherwise unvitiated modes of thought, in themselves simple, original, and forcible, the dark, wild, and gloomy grandeur of fearful superstitions, rugged manners, and solitary and undivided thought ; a fount of masculine and perennial freshness that at a late period invigorated and supplied with novel energies the exhausted and stagnating currents of literatures more feeble but more refined.

In France this error of weakness has been long apparent, and universally felt of late years, if not confessed, by the nation itself. To England, that had so often borrowed from her, France applied in her turn, and admitted with secret pleasure and obvious reluctance the gleam of "barbarian genius" that in Shakspeare and his descendants was enlightening the wakening intellect of the nation. That the first dislike was converted at length into an absolute mania, was no more than could be expected in the nature of things, and the nature, more especially, of French constitutions. But every passion exhausts itself ; every novelty tires at length ; and now the current has set in the direction of Germany ; though not yet with the impetus characteristic of Gallic emotions. It is, however, a movement not of whim but necessity ; an absolute want of oxygen in the exhaustion of the literary atmosphere of both countries ; M. Matter well observes :

"Yet the progress we ourselves have made has probably approximated us to the north as much as this has approximated towards us. In truth if our literary desires turn now to England and Germany, it is not a mere caprice of taste but a movement of intelligence. In these two countries moral and political studies have assumed so glorious a course, and we ourselves are in a social condition so analogous to that of our neighbours, and so different from the past, that our literary

sympathies are established by the force of circumstances, the community of wishes, the fraternity of all thought.

"With England we have been for more than a century united by the noblest labours of the human mind, those of legislation, philosophy, and general politics."

After remarking that for a long time these subjects were merely matters of speculation in France and are now become practical, and that her institutions and views of the social future are absolutely at present those of England, M. Matter observes that the difference now consists in forms and manners, and that these will be permanent, though the principles are the same.

With regard to the German, he notices and with justice, that it does not possess for his countrymen the same claims to attention, and is not for them in the same degree an object of study, though it offers for many classes of society a powerful interest. It presents to all advantages and inducements which the English has lost by having become familiar in France.

The German is not only the language of erudition and metaphysics, it is particularly the language of the moral sciences, the study of which is so important for us in the social state wherein we are placed by so many revolutions of manners and ideas. It is in fine the language of a million of Frenchmen.

"The German has also points connected with higher considerations. It is a language of astonishing variety. The English is bounded; the French can in future but exhaust itself. The German since it has become classical, is in its third phase, and seems susceptible of still farther transformations.

"Thus does the German daily gain ground amongst us."

And the writer conceives that it is destined to play a great part in the new epoch into which the French tongue is about to enter; that is, its struggle with the northern idioms, after having so gloriously sustained a contest with the languages of the south, and after profiting so well by the education bestowed on it by the ancient tongues.

From the language to its literature the transition is easy; and in regard to the German, a phrase of very common acceptance, namely, that its literature is but very modern, and of to-day, seems to require some explanation. It is not in truth very clear what is the received sense of this saying, at least if we are to view it in a different light from that of the literature of any other nation of Europe. All differ essentially in their modern from their ancient phases; and yet Herder, if we remember

rightly, seems to countenance the general opinion just alluded to, though only in part, when he speaks of the youth of the German muse in her race with that of Britain.

The writers of the volume before us do not appear to uphold the opinion in question in their general estimate; for they affirm of the German,

"This literature is, without question, one, of those deserving the most to be studied. It is ancient, it is original, it is rich, and little known out of Germany. Its especial distinction is great vigour of conception, a high degree of ideality, a sort of worship of nature imposed by profound sentiments of religion. Like the country which produces it, it forms a real transition between the literature of the east, of which it possesses all the gravity and mysticism, and the literature of Scandinavia, more pompous, more dry, and more severe."

According to the same authorities, its poetry, like its prose, has fused several kinds into one to form a novel style, commonly termed the romantic. This we are strongly tempted to question, though it is the general opinion; for did the romantic originate in Germany? Are not the ballads of the South a sufficient answer, and were not they the progeny of the proper East, and marked more distinctly with their present characteristics than imbued with the tints of the North? Germany has a rightful claim undoubtedly to her own peculiar romance, and this we would especially reserve; but for the epithet itself it is perhaps too general and indiscriminating to be referred so freely as by our authors to that one sole source. "It is thus," they tell us, "that in appreciating this literature we see combined at one time and confounded in mutual embarrassment, the devout and gallant spirit of the Provençal troubadours, the dreamy and mystical imagination of the Oriental poets with its pomp and dazzling splendour, and the sombre genius of the North, that lives in the tempests and presides at those gigantic battles where the bravest of warriors fight hand to hand with the gods themselves." Our readers are, however, aware that this form of romance is to be found, though in more polished shape, in the ancient pages of Hesiod and Homer, and the more modern tales of Ariosto. Whence then came all these? From the earliest East undoubtedly; and they are only modified, not created, by Scandinavian or Teutonic genius; more severe, more stern, more simple, and more shadowy in the latter; a different species, though the genus is the same: the drapery of classic grace or Oriental effeminacy was unknown or despised, and the genius of

the north robed his form but in the clouds of his own domain, or presented it, ample and bare, in the sole might of its colossal dimensions.

The History of German literature is divided by our Author into seven periods.

1st. The Gothic, from the earliest times when barbarism dispersed the remains of Roman civilisation, down to the reign of Charlemagne (768.)

2d. The Frank, or period before the Hohenstaufen, 768—1137, when the light thrown by Charlemagne sank in the obscurity of his successors.

3d. The Suabian; from the rise of the Hohenstaufen race to the origin of the German Universities, 1137—1348; the time of the Crusades, Troubadours, and Minnesangers.

4th. The Rhenane, lasting till the Reformation, 1348—1534; when science raised her head above literature; when the tourney and chivalrous combats disappeared, and Cologne, Erfurt, Leipsic, Rostock, Basle, Treves, Mayence, Wittemburg, &c. successively rose in imitation of Italian institutions; when Guttenberg invented printing at Strasburg; when knowledge became popular; and when, finally, Luther appeared on the scene.

The 5th, or Saxon period, embraces the school of Luther to that of Spitz, 1534—1625; the most important portion of the 16th century—the epoch of regeneration, of religious wars, of conquests in America and Asia. Literature flourished by the religious controversies; poets and men of genius cultivated science and the belles-lettres, or refined the Minnesanger lays into the strains of the Master Singers, amongst whom was the celebrated Hans Sachs. Luther, reforming religion, reformed also the language; by fusing, we should say, like Homer under a somewhat similar change, the two principal dialects in use into the type of the modern German languages.

The 6th period, Silesian and Swiss, comes down to Klopstock, including the interval from 1625 to 1750. Spitz, the founder of the Silesian school of classicists, then opened the way for foreign literature. France inundated the soil with new ideas and fashions of thinking and writing, literary societies were formed every where to assist or oppose the innovations, and from this conflict of principles sprung the new work of German classical literature.

The 7th period reaches from Klopstock down to our days; i. e. 1750—1838; when, as our author somewhat fancifully remarks, “the most illustrious pleiad that ever shone on ancient Germany appeared in Klopstock, Schiller, Goethe, Engel, Bur-

ger, Wieland, and so many others.” These last, unnamed, being too many for the constellation in question, form, we presume, the Milky-way; and it must be owned that some of them have supplied the world with that nutritive diet in rather larger quantities than accords with the matured state of European development; and, we speak it reverently, aided by one at least of the labours of Goethe himself, have raised a sort of bread and butter school, greatly relished in our infancy throughout the nurseries of Europe.

We turn from the Volume before us to notice with our warmest commendations, a work on the actual state of Germany by an English Scholar of deserved reputation. To those who seek to know more of that remarkable, and rising, but half undeveloped land than can be learned in a hurried tour, or inferred from the passing notices of newspapers, we would earnestly recommend this book,* where may be found the real position of Germany, its resources, political and industrial relations, its progress in the sciences and arts, and in literature, with all the details that are necessary for a thorough comprehension of the subject, and of the great political and moral question that is to be solved perhaps in our own days, by the prodigious advances of the German every way. To the work itself generally we can confidently refer our readers, but our more immediate business is with the literary portion of it; and the opinions in this department are so fair and so candid, that they give, better than anything we have seen, an idea of German literature as it really is.

We select amply from this part of the work.

“The early literature of Germany did not represent the national mind, nor did it tend much to enlighten nor to move it. It principally consists in treatises, more or less elaborate, on matters of theology, jurisprudence, natural history, physics and medicine, with no small sprinkling of alchemy, astrology, and metaphysics. These were almost all written in Latin, which appears to have been almost a second tongue, used familiarly in conversation, and still more familiarly in composition.

“The modern literature of Germany may be said to commence with Gottsched, who was born in the year 1700, and who died in 1766. He was educated at Königsberg, where he took the degree of Master of Philosophy in 1723. He was shortly afterwards

* Germany; the Spirit of her History, Literature, Social Condition, and National Economy; illustrated by reference to her Physical, Moral, and Political Statistics, and by comparison with other Countries. By Bissett Hawkins, M. D. Oxon, F. R. S., London, 1838.

obliged to quit Prussia, where his stature exposed him to the risk of being forced to enter the ranks of the king of Prussia's giant-grenadiers. He took refuge at Leipsic, and was elected professor at the university there, in the year 1730. Gottsched claimed the character of an universal genius, which he was far from being able to support. He attempted to play at once the philosopher, the grammarian, the critic, and the poet. But he survived his own fame, and is now consigned to a degree of oblivion which he certainly does not deserve.

"He did not occupy himself with style and form exclusively; he may be said to have founded the periodical literature: he encouraged numerous young authors, and placed the learned world on a better footing with the booksellers. With the assistance of a number of scholars, whom he had gradually gathered round him, he published a translation of Bayle, whose work, from its free and novel cast, produced a great sensation in Germany. Though a grave professor, he did not disdain to interfere with the theatre, and his criticism succeeded in driving away the Merry-Andrew (Hanswurst) from the stage. A Leipsic lady assisted his reforming career by the introduction of feeble translations from the French. The influence of the pseudo-classic rules of France on the German drama lasted till the criticism of Lessing demolished it at a blow, and rushed unfortunately to an opposite extreme. The period of Gottsched's glory was between the twentieth and fortieth years of the last century. He legislated for the literary world with a dictatorial air; but into the nature of man, where alone the laws of criticism are seated, he never deigned to cast a glance. Aristotle he misunderstood, and his imitation of the French was clumsy and imperfect. Goethe has left us a highly amusing account of the first visit which he paid to Gottsched. By mistake he was ushered into the dressing-room of the Professor, who, as he entered, clapped on his wig with great dispatch, then boxed his blundering valet's ear with one hand, and received his guest with the other. Gottsched's system of criticism is particularly open to the charge of superficiality and weakness.

Hagedorn and Haller were eight years younger than Gottsched; they were both born in 1708. In classing, then, these poets together, we only refer to some similar points in the character and tendency of their works. They commenced an indirect opposition to Gottsched, and as they overthrew him, without expressly aiming at him, they rendered his overthrow the more complete. The criticism of the Leipsic Professor was entirely negative. He had prescribed only sobriety of expression, and such poetical enthusiasm as could help itself just as well with prose as verse. Haller introduced the freedom of English literature into Germany. He, at first, took Pope for his model; but if

he excels him in depth and solidity, he is his inferior in point of style. Haller deserted poetry for physiology at thirty, and would fain apologize afterwards, for having devoted so much time to the Muses. It is a common prejudice that a man cannot distinguish himself eminently in two departments. The philosophic reputation of Haller has injured his fame as a poet. To his scientific eminence, he owed his professorship at the university of Gottingen. Here he was an active contributor to *Der Gelehrte Anzeiger*, at that time the most famous periodical in Germany. In estimating the comparative worth of Haller's works, we must never forget that he was without German models. He had the classics certainly, but their sphere is too remote for the imitation of a genial poet, who feels the necessity of giving expression to life as he breathes and feels it. Haller wrote odes, but in imitation of the French—of Bap-tiste Rousseau, for instance. These compositions instead of being poetical, are a collection of rhetorical rhymes. The criticism of our poet-philosopher is not of much value; for to criticise a literature which is without models is to thrash empty straw.

"Notwithstanding the exertions of the Swiss school, Leipsic continued, even after the expiration of Gottsched's popularity, to be the metropolis of literary Germany. In the middle of the last century, it was the residence of Gellert and Klopstock, of Kramer, Rabener, and several others, whom we shall not have space to dilate upon. But somewhat earlier than these, flourished J. E. Schlegel, who was born in 1718, and who died in Denmark, in 1749. He was the first who gave a character to the German theatre, and is, therefore, in his relation to German dramatic literature, especially worthy of notice. He commenced his career by translating some tragedies of Sophocles and Euripides into German rhyme. Though he abandoned the French school of tragedy, he was not quite free from its influence. The favourite plays of the æra we are now considering, were of the kind technically called characteristic, in which a character made up of extremes, whose vices might be either moral or mental, was put to all sorts of trials, through five tedious acts. Schlegel brought on the Copenhagen stage, 'The Dumb Beauty,' a rhymed comedy in one act, which is admirable of its kind. From this author, the influence of French taste on the German drama dates its decline; all subsequent attempts to modify French plays for that stage have been decided failures. If these productions are of any worth, it lies in their consistency and unity, which are destroyed as soon as they are altered."—pp. 78—85.

The fame of Shakspeare renders the following interesting.

"For some time after the period of which we are now treating, Shakspeare seems to have been unknown in Germany. Bodmer quotes him under the name of Sasper, and a

bibliopolist of those days tells us that he had heard a great deal about him, but that he had been unable to obtain any of his works."—p. 86.

We need only select a few passages in passing for our readers.

"Gellert is one of those authors, who by a prudent management of very little talent, earn considerable fame. The public has confounded the man with the poet; and his literary insignificance was forgotten by those who admired the goodness of his heart. Fame, however, seems now determined to vindicate its impartiality, and is consigning poor Gellert to undeserved neglect. His comedies are the weakest of his works; one finishes perusing them really without knowing what all the five acts have been about. His tales and fables are much too similar; he seems to have confounded the species. The 'Letters' of Gellert were received with great applause, and have survived, in general estimation, many of his works. But it is impossible that a book, the interest of which is but local and temporary, should take its stand amongst the classics of a nation.

"Klopstock came to Leipsic in the year 1746, when he had already commenced his great poem, 'The Messiah,' and was full of plans for its completion. It would be useless to deny, that in some parts of it he has imitated Milton, but on the whole he pursued an original path.

"Klopstock had no ability in rhyming; his muse was neither docile nor pliant. On this score, he was at first considerably embarrassed, being far from decided as to what measure he should choose for his verse. He intended, at first, to write in rhymeless Alexandrines—the worst form he could possibly have chosen. Fortunately, he hit upon the hexameter, in which his success was signal and complete. The first cantos of the Messiah were published, 1748, in a periodical which issued from the Leipsic press. The effect which it produced upon the public cannot be measured, even by the greatest possible sensation which a work can now create.

"In speaking of the Wieland of this period, we must not confound him with the Wieland who dazzled Germany in the year 1763. They are one person, it is true; but the one person underwent a complete metamorphosis. At this period, he espoused the cause of Plato against that of Epicurus, and wrote a poem to refute the "De rerum Natura," of Lucretius. Besides this, he composed Scriptural epics, in unwieldy verse; as, for instance, *Der geporfte Abraham*. Sulzer was the scholar of Bodmer in poetry, and of Leibnitz in philosophy. Or, rather, the creed which he professed, and which was very popular just at that period, was an amalgamation of all possible systems.

"Kleist's 'Spring,' is an imitation of the 'Seasons' of Thomson, which is composed of a series of pictures drawn with truth and feeling, but in no definite form, and with no

general spirit pervading the whole. He has all the faults, and, it cannot be denied, all the beauties of his model; but poetry is not entirely a descriptive art. The works of Kleist were disfigured by the corrections of Ramler; and it is only lately that they have been published from the original manuscripts. Ramler has the credit of having tamed whatever was original and energetic in the poetry of his period down to his own standard of correct mediocrity. In his old age he versified the Idylls of Gesner, which had never possessed great merit, but which he deprived of all they had. Gesner, after having been educated in the principles of the Swiss school, came to Berlin about the year 1750, to learn the trade of a bookseller. Disgusted, however, with this occupation, he took to painting, for which nature seems to have intended him. He had received no instruction in the art, and he painted, at first, a number of landscapes with common oil, so that they would not dry. It was his distress on this account, which led him to seek and ask the advice of the Professor of Painting. The talent of Gesner was now soon recognised, and his landscapes have always been very justly praised. Unfortunately, we cannot say as much for his literary publications. His Idylls are landscapes, as far as he could make them such with pen, ink and paper. His characters are like those of Ossian,—speaking spirits and shadows, drawn on a coloured horizon, and sweeping along luxuriant ground."—pp. 86—90.

We cannot, we confess, discover the similarity or aptitude of the last illustration.

"Herder was a critic, and in the best sense of the word,—one who was fonder of dwelling upon beauties, than of searching out defects. He was of a pliable, plastic, susceptible nature; at last, perhaps, he verged towards the undecided and indefinite; and even in his best years, we too often miss in him the strength and acuteness of a master-mind. He first gave to German literature that cosmopolitical tendency, which has increased since his time to such a degree, as to have become its peculiar boast. Herder was a poet, but not a philosopher;—rather a literary than a learned man. He had the faculty of happily divining where he could not see very clearly. Though acquainted with many languages, he had not a thorough knowledge of one. His researches on the subject of popular and legendary poetry seem to have led him to the conclusion, that the Muses can only be successfully cultivated by their rudest votaries. But this is a grand mistake; Art is natural to man, who cannot, even in his wildest state, be lost to a love of it; and why should poetry be deprived of its aid? We do not disgrace the heavenly guest by clothing her in a costly dress; we rather heighten the variety of her beauties, and of our own enjoyment."—p. 103.

We take some portions of the remarks on Goethe.

"In his first works, Goethe was the advocate of that which he felt to be Nature, against that which he thought to be Art. His 'Götz von Berlichingen' was written in defiance of all the old dramatic laws; and in 'Werter' he would seem to have aimed at the abolition of the conventional and artificial, and at the recognition of what was called the voice of nature in their stead.

"A year after Götz, appeared 'The Sorrows of Werter,' which produced an incalculable effect upon the public, by whom it was tumultuously received. This book is a singular mixture of truth and fiction; to a certain extent the author identified himself with his hero, and then superadded the misfortunes of a young man named Jerusalem, whose suicide, the consequence of an unfortunate passion, made at that time considerable sensation. As far as the sentiments and feelings of Werter are concerned, we may take the identification to be complete; though how far the author was conscious of it at the time of writing is uncertain.

"Of the attacks which this work met with at the hands of the critics, Goethe took no notice; but he subsequently added one to their number, in his 'Triumph of Sentimentality.' With this latter word, 'Werter' was the first to make us acquainted; great as is the part which it has played in our time, we may search for it in vain before the days of Goethe. The feeling, though now naturalised in Germany, is of foreign origin. The *Nouvelle Heloise* of Rousseau first perfectly incorporated it, and is composed of little else; it is more artificial, but less morally objectionable than 'Werter.' In England, Sterne had touched the same chord, but with a steadier hand and healthier result. The work, however, which mainly contributed to establish the fashionable feeling in Germany, was the 'Ossian' of Macpherson, in which the morbid refinement of the moderns is pictured to have existed at an age, and amongst a people, where no refinement whatever was known.

"'Stella' he entitled a tragedy for lovers, but a good tragedy cannot be usurped by any class; it addresses itself to mankind at large. The hero is a worthless character, who is subject to every feeling, and faithful to none. Discontented with ordinary felicity he sets out in search of something more than happiness. After deserting his wife and daughter, and uniting himself to the innocent and lovely heroine, without any diminution of his passion for the latter, remorse seizes him on account of his treatment of the former, and he hits upon the convenient idea of arranging the matter so as to be able to live with both, in a way of his own, somewhat repugnant to conjugal institutions. In these plays, Goethe allows all emotions and feelings to have their course, without disturbing them by even the mention of morality; but such a system undermines all strength of mind, all dignity of character, and instead of having a right to our sympathy, it demands our contempt.

"Shortly after the publication of these dramas, a metamorphosis began to take place in the literary character of Goethe; he recognised his errors, and was one of the few men of his time who rescued himself from the influence of his works; he withdrew to study and self-examination, and all that was heard of him for some years, was an indefinite report of his being engaged in the composition of 'Faust.' In 1785, he published 'Egmont,' the most theatrical of his tragedies, in which he is no longer true to his theory of the natural, for the language, instead of being the prose of common life, rises often to the poetical.

"At this period Goethe made a deep study of the Greek tragedy, and recognised the poetical foundation on which Shakspeare's world is built; the result of this is to be traced in his 'Iphigenia in Tauris;' and 'Egmont' is a sufficient proof of the progress he had made in the comprehension of the English dramatist. The idea of making Tasso the hero of a play, occurred to Goethe during a journey through Italy. His drama of this name has a certain incidental interest, inasmuch as it doubtless, to a certain extent, describes his own situation. The love of a poet for a princess, and the embarrassing circumstances with which it is accompanied, were subjects with which he was not unacquainted. The elegance and correctness of diction in this poem, cannot be surpassed; but it had faults which no one had anticipated in Goethe: it was too cold, too artificial. He had not only undergone a change, but he had passed to the opposite of his former self.

"In 1794, Goethe published his 'Wilhelm Meister,' which was received by the public with indifference; the literary world, however, prepared its ultimate success by enthusiastic laudation. The style of this work is admirable; the clearness and depth of thought it displays, are alike remarkable, but it has the one great fault of its great author—it is an imperfect whole. It does not solve the problem which forms its foundation; it is but an introduction, a beginning without an end.

"During the early part of his career, Goethe had paid but little attention to versification, though some of his most durable fame rests on the versified productions of his youth—his ballads and songs, which for melody and depth of feeling, are truly singular. He now, to exercise himself in the composition of hexameters, composed an excellent version of Reynard the Fox, in that form, of which he shortly afterwards showed himself a master, in his 'Hermann and Dorothea.' This work regained for him, in a great measure, the favour of the public; its genuine warmth of feeling, and poetic truth, were universally applauded.

"The tragedy of 'Faust,' was one of Goethe's earliest and latest labours; the first part was published in 1790, and it was not finished till 1831. This is one of the most genial works of the greatest German poet, but it is not a philosophic whole. It displays dramatic talent, but its different scenes, the

force and beauty of some of which are perhaps unequalled, were nevertheless not composed with any determinate view of their ultimate position. The idea of finding a philosophical system in this poem is ludicrous, and the volumes which have been published with that intention are only valuable as curiosities.

"Goethe did not shine in a critical capacity; he prescribed to all artists a strict imitation of the ancients; but this is at once a narrow-minded and discouraging doctrine, for every age, unless it be worthless, must have a character of its own.

"Goethe has almost invariably been described in the language of unqualified panegyric, and his character as a man is little known to foreigners. Menzel, in his '*Deutsche Literatur*,' has done some service in probing thoroughly the pretensions of Goethe; perhaps he has been somewhat rough in his manipulation. Genius is a gift of nature, but the use which we make of it is our own, and for this we may justly be brought to judgment. Goethe possessed more *influence* than any writer ever enjoyed; idolised by his countrymen, caressed in palaces, and sung in the cottage, he might have done something more than amuse. No one was ever improved by his works, none ever became less sensual, less worldly, less intriguing, less profane. Although he has touched every string of literature, nowhere does he rouse to patriotism, to religious reverence, to the domestic duties: one almost confounds the notion of right and wrong in reading his works, all seems blended and confused—amusement and the fine arts, theatres and critics, the passions and the cleverest modes of gratifying them, appear the great object of life. Let one short trait suffice: when Napoleon entered Berlin in triumph, Müller wrote a Discourse in French (*De la Gloire de Frederic*), in which he compared the Conqueror to the old Prussian hero; Goethe translated it into German; and at another time, wrote an Epithalamium for this evil genius of his country."—pp. 104—109.

Of Schiller we learn with much fairness,

"Nothing could possibly be more galling to a mind like his than the arbitrary regulations of the military institution at Stuttgart, in which he was educated. Here he wrote his Titanic poem, '*The Robbers*,' which indicates sufficiently the wild force of his character, and the despotism of the circumstances which had almost driven him to madness. This work is worse than '*Werter*,' because more unnatural: with loud pretensions to originality, it bears prominent marks of imitation.

"Francis Moor is a prosaic Richard III., exciting equal hatred, but demanding no admiration. The fame which this play obtained for him freed Schiller from the shackles of his situation, and he now was appointed to a post in connection with the theatre, at Mannheim, where he published his '*Fiesco*' and his '*Cabal and Love*.' Perhaps the peculi-

ar feature of the former is its political bearing; which forms its chief claim to originality. '*Cabal and Love*,' abounds in convulsive demonstrations of passion. To his first career of enthusiasm succeeded, with Schiller as well as with Goethe, a period of self-examination and study. His next production was '*Don Carlos*,' of which the outline is good, the plot powerful, and the execution a manifest improvement on his former works. Its versification, however, is indifferent throughout: the style keeps a middle course between his former extravagance and the lofty rhetoric of the French; the political philosophy which pervades it, is as foreign to the century which it represents, as it would be to the most distant we can imagine. It professes to be an historical picture, but it is, in fact, a work of invention; and the rude features of the poet's former muse, break everywhere through the more civilized mask he had now attempted to assume. A year after the appearance of '*Don Carlos*,' Schiller published his fragment on the history of the insurrection of the Netherlands; a subject which he had not studied very profoundly, and which he did not know how properly to treat. The duty of the true historian is, if the expression may be used, to reflect events, and not to reflect upon them. Our author now essayed the '*History of the Thirty Years' War*,' and showed that he had made considerable improvement as a historical writer; indeed his whole life was a series of improvements.

In 1798, appeared '*Wallenstein*,' a play in three parts, of which the first is not connected with the others, of which the second has no end, and the third no beginning. About this time, Schiller avowed himself a disciple of Kant, whose terminology imposed on the public to such an extent, that it was thought that he had found a key to all the difficulties in the arts and sciences. Our author's philosophical disquisitions were more than ordinarily successful, because he was, at any rate, either intelligible or elegantly obscure; but he was too abstract and refined to produce any more than a temporary impression. The negative axioms of Kant's philosophy were true, though the positive were shadowy and unsatisfactory; indeed, his whole system was sceptical, though his followers long persisted in boasting of its constructive powers.

"After the publication of '*Wallenstein*,' which was enthusiastically received both by the reading and the theatrical public, Schiller devoted himself more exclusively to the drama; and he now struck into a path which was to be intermediate between the classic and the romantic, though, in fact, it was only situated between both without being allied to either. Of his subsequent plays, '*Mary Stuart*' is one of the best; its representation is very effective, though partly at the expense of historical truth. In his '*Maid of Orleans*,' considering the romantic view which he took of the character of his heroine, the colouring of the execution was too

faint; for Schiller, though of a bold and uncompromising nature, was timid and misgiving as an artist.

"The 'Bride of Messina,' and its preface, may be looked upon as a confession which Schiller was at the trouble of making of his own imperfection; and from the latter, which betrays a complete confusion in his ideas respecting the theory of the drama, we may gather that he understood the classic principle which he sought to imitate, no better than the romantic which he wished to avoid. It is impossible to imagine a costume for this play. The chorus differs from that of the Greeks, in being divided into two interested parties, who do every thing but come to blows for their leaders. But the Greek chorus is essentially an impartial whole; and represents the ideal, contemplative spectator of the drama.

"Even the last and best play of Schiller, *William Tell*, is not free from a trace of his love of tragic antithesis; the murder of the emperor Albert is something quite foreign to the liberation of Switzerland; and it is evident that the murderer is merely introduced for the purpose of being contrasted with Tell. The local truth of this drama is extraordinary, particularly when we recollect that Schiller had never been in Switzerland: he was indebted for it, in a great measure, doubtless, to the admirable history of John von Müller.

"The lyrical poetry of Schiller has been eminently successful, both at home and abroad; and his ballads have been held up as perfect models. But in truth, this is his weakest side, and his ballads are among the worst which we possess. All his works are more or less imperfect, but these are glaringly faulty; for everywhere, even in the simple legends of old which they profess to revivify, we are troubled with his philosophic reflections and the discord of a modern nature. Had he lived longer, it is uncertain how far he might have been successful in correcting all his faults; some of them appear too deeply rooted to have been ever thoroughly eradicated. But let us conclude justly, by remembering to praise the candour which rendered him alive to his defects, and the genuine modesty which always restrained him from great pretensions."—pp. 111—114.

We cannot conclude our notice of this part of the subject, and of men so celebrated as the writers before us without entering our protest against the excessive exaggeration of praise that has followed the name of Goethe wherever it has been pronounced. If encomium from all quarters is a proof of excellence it must be a free and unbiassed encomium; but we deny that such has been the case in this instance. Of the plaudits of Germany there can be no question; and as a German writer we are happy to allow Goethe all the praise he can obtain at home. As a delineator of nature, manners, senti-

ments, opinions; as the first great reformer of the rugged style of the older poetry; as a man of vast acquirements in any or all departments of knowledge, even as a man of very high genius, we concede him every possible admiration. But we must be distinctly understood to refer to these, and any other points on which he really merits our sympathies, with a positive reservation. He is national, not universal; exquisitely elaborate rather than overflowing, the trace of study appears in every step: a giant perhaps, but in national peculiarities; a genius certainly, but of artificial life; an artist of nature, not her worshipper, that must make and fashion her image before he could adore it.

We pass over the dull, unsympathizing obscenities that disgrace some of his works, written it would seem, for their especial display: we pass over, and with sorrow and shame, the utter inability, incapacity to comprehend one single trait of delicacy, decency, and morality, that is obvious to every eye but his own. In manners and morals every nation has in its writers occasionally violated the proprieties; but all these, all worth noticing at least, were conscious of the wrong: when they lead astray their reader it is by turning him out of his direct course, into some nook or corner, and raising the veil that covers for him and them the form of corruption: the light they throw is artificial, and passes through a medium coloured by the passions, in order that he may not by the presence of purity be reminded of grossest impurity, by unsophisticated calmness of feelings of their most atrocious perversions: the pulse of shame is not extinct in their breasts, that they can rely upon the reader's callousness as confidently as on their own. We would ask, is this so with Goethe? Is not the very basis of some of his works the very theme most avoided by other writers? Does he ever hesitate to picture depravity? Has he ever shown that in painting it he was aware that the picture could not be hung up in open day, nor exposed to the public eye? What maid, what wife, what woman of all the sex could be so lost to even conventional forms as to hear the outline even of these elaborated infamies? What man, deserving the name, does not feel his judgment insulted and his pride of honour debased by being asked to dwell upon these loathsome carcasses of putrifying abomination, these nauseous public gloatings and laboured delineations of vice, so fondly dwelt upon by this spiritual dotard of sensuality.

We must avow with sincere satisfaction that the first blow has been struck at this system by a periodical of the highest rank in

England. The notice there given of the "Elective Affinities" may be fairly extended, and we have the less occasion to pollute our pages with reference to them. But if we do not envy the intellectual construction of those who can wade through the degrading mixture of filth and sluggishness, insipidity and grossness, that in such works debases the name of one born, we could have hoped, for better things; and if we are to excuse them, as alone we can, by libelling his whole nation in supposing they could possibly afford him prototypes for such displays, what are we to think of those who, in evil hour for their own name, have sought to pander to England and Europe by praising and translating those works?

And what is the atonement for these! In what does Goethe so far excel the world as to claim from them its worship for him who could "call evil good and good evil?" If the obliquity of his moral sense was such as to turn early puling into matured abomination; if seduction through the medium of the senses was his desire in youth, could the sentimental sage find a happier parallel in warping feelings into crime than by converting pathos into puerility? his love of another's wife shared with love of bread-and-butter, while the tragic muse weeps over an out-of-elbows' coat! glories shared with our own Liston in his personation of Werther.

But we are reminded of FAUST.

In what does the marvel of this consist? In what is Goethe's claim borne out to the title of the German Shakspeare? We utterly deny the epithet's correctness in the usual sense, unless the term German is to be understood as a modification. Shakspeare ruled the heart and swayed the sympathies of mankind. His thoughts lay open the intellectual world of man; his aspirations ennoble the mind. The most that Goethe does is to surprise: where he talks of feeling, it is to drone or to sneer; his powers

are fantastical, his imagination half cold. The scenes of nature, actual or imaginative, the pulse of the heart, the yearnings of emotion, all are merely elaborately beautiful; all are perverted from simplicity to artificial life.

We are far from denying a high degree of merit to this poem; but we contend it is not so pre-eminent as it has been made to appear by injudicious praise on the one hand, and weak consenting credulity on the other. We are well aware of the praise of real judges as bestowed on this performance, and of none more than Mr. Hayward, a scholar, a critic, a man of unquestioned taste and genius. But though our Journal has been warm in commendation of the Faust, we must admit that there are material drawbacks; to the eulogiums we ourselves would bestow much has been added by others, and much too that requires serious modification. We have already stated that artificiality is Goethe's forte; and however repugnant we must feel to strip, even if able, one leaf of laurel from the Mighty Dead, and such in truth he is, our task, since we have undertaken it, must be done, so far as our space will allow in the present paper.

We shall take, too, our own version, since the close and spirited translation of Blackie is not before us, and that of Tracey is at times, though not often, an improvement, may we say it, on particular passages. As to Anster's, so constantly praised, it is one half at least the translator's own; an absolute paraphrase, and a very excellent one in general, but still a paraphrase of the original; some of its passages running to nearly, and sometimes more than to, double the length of the German. Thus substituting beauty for conciseness.

Nothing can well be more beautiful than the original dedication. The man of genius and the artist are both at the summit of their craft in this.

DEDICATION.

"Again ye swarm around me, shadowy train!
Once wont in youth this sorrowing gaze to meet;
And will ye now, for my behest, remain?
Still shall my heart's forgotten pulses beat?
Ye throng me round—well, rule me once again,
Since thus thro' mist and gloom my soul ye greet:
While drinks my breast again, with youthful bound,
The magic breath your presence breathes around.

"Ye bring with ye the forms of other days
Where many a cherished image glads my eyes:
And still, like faded, half-remember'd lays
Past memories of love and friendships rise.
Each pang renewed, each plaint recalled, betrays
What labyrinths wandering life supplies;
And mourns the loved of brighter hours, o'ercast
And shorn of bliss, who leave me, here, the last.

" They hear no more these closing notes of song,
 The hearts for whom I waked its earlier lay ;
 For ever cold that sympathizing throng,
 And ah ! th' applauding echoes died away.
 My sorrows mourn a stranger-crowd among,
 Whose very praises sadden and o'erweigh ;
 And all to which my strains had gladness borne
 If yet surviving, far asunder torn.

" And now my soul unwonted yearning owns
 For that still calm, the spirit's phantom-reign :
 And float and fall in undetermined tones
 My feeble numbers, like th' Æolian strain.
 A cloud comes o'er me ; tear on tear bemoans,
 And yielding manhood's pride of soul is vain.
 All that is left me, distant seems to be,
 And all I've lost,—my sole reality."

We take the next passage as an instance of the artificial : the Poet here speaking is not, we should say, a Poet in the best sense of the word. He speaks artistically, and beautifully doubtless, but he is the mere craftsman throughout the speech : a sense of nature pervades the whole ; but the er-

ror, and this reigns in every line, is that, unlike the real poet, the true man of genius, he converses the order of things and perverts the real feeling ; for he everywhere turns nature into the artificial, while true passion and genius turn the artificial itself into nature.

THE POET.

" Oh tell me not of that detested throng,
 The scattered senses flee their very gaze :
 But hide me from the crowd, that bear along
 The soul reluctant in unending maze.
 No, bear me where beneath unchanging Heaven
 Untainted joys alone the Poet sate :
 Where love and friendship to the heart have given
 The Godhead's power—to summon and create.
 Ah ! all that gushes from the spirit's deeps ;
 All that the lip's low-murmured ordeal tries ;
 All it rejects perchance, and all it keeps,
 Too oft in some unguarded moment dies.
 Oft too for years th' unformed conception sleeps,
 Then waked to full perfection meets the eyes.
 The brilliant for the passing hour is made :
 The pure remains, thro' ages undecayed."

This, it may be answered, is in character ; it is so, but this is our proposition ; it is too much in character for the truth of genius : and it is the mere artist alone that looks on Nature only with an eye to art.

The next extract is liable to precisely the same objection. Again the glory of nature sinks down after the tenth line to the pathos of art ; and though the skill of the writer elevates the subject to the close of the specimen, it is only to the praise of THE ART.

Nor can it be efficiently objected to us, we conceive, that it represents art as triumphing over nature : because the former is ever compelled to work by means of the latter ; its only power is to detect the powers of the last, and to bring at best one of its forces to direct another. As a whole, nature must be more grand than art, for it includes art. To pass from the first, then, to the second, is to lower the tone.

THE POET.

" Begone and seek thee out another slave—
 What, shall the Bard his proudest duty wave !
 The sacred right of man, by nature lent,
 Resigning basely to thy will's control !
 How rules he every subject soul ?
 How does he govern every element ?
 Is't not that harmonies, his breast o'erflowing,
 Sweep the world back with them when homeward showing ?
 When nature her eternal length of thread
 Spins heedless on, to keep the spindle going :
 When Being's inharmonious mass is spread
 Confused, rude discords only throwing ;

Who portions out the ever-flowing strain,
 Infusing soul, with rhythmic art restored ?
 Who bids each bosom own the general reign
 Of consecration, in one proud accord ?
 Who bids the storm with mortal passions rave,
 The sun-set dyes in sacred feelings glow ?
 Or heaps the lovely flowers spring largely gave
 But in the loved-one's path to throw ?
 Who from the green unmeaning leaves has given
 A wreath that every merit well repays ?
 Who grasps Olympus ? who unites with Heaven ?
 'Tis Man—whose might the Poet's soul displays."

Our next extract is far more strongly illustrative of the same tendency. The Poet does not feel as other men would : it is again not nature that swells in his bosom, but the sacrifice of this to his craft. Every man but Goethe would have made the native feelings the first and leading object : with him it is the second. He is the mere artist and forgets the "celare artem," the concealment of his object. The man would have recalled the crowd of pulses, the artist only could have talked of them as a crowd of songs. The burst of youth would never have done this ; still less the remembered enthusiasm of after-life, that would have felt how poor and cold and vain and artificial were even the most impassioned themes, in comparison of the overflowing gush of feelings that struggled, and how vainly do they struggle ! for utterance even then. The close is far superior, and confessedly so, for it returns to the one mighty impulse.

THE POET.

"Oh ! give me now once more the days,
 Th' enlarging senses youth bestowed ;
 When from their fount th' o'ercrowding lays
 In one unbroken freshness flowed.
 When the world lay in mist concealed ;
 Each bud with marvel-promise sheening ;
 And I the thousand flow'rets gleaning
 So richly decking every field.
 Nought then was mine ; I wanted nought ;
 Truth my sole wish, a dream in every
 thought !
 Give all th' unbounded pulse to rove ;
 The ecstasy, o'erwrought to pain :
 The strength of Hate—the might of Love—
 Oh, give me now my youth again !

Of the charm of these passages in the original, (any more than of our own feebleness in rendering them) we can entertain no doubt ; they are beautiful, they are artistical, but to the breast of man they should have been UNIVERSAL.

The next passage is elaborately gorgeous : but if the wonders of Creation were the theme, why confine it to the mere terrestrial phenomena ? The opening would indicate the necessity of more : but it opens so only to disappoint us. The planetary and other

systems were known fully at the time this was written, yet they are not referred to.

RAPHAEL.

"The sun prolongs, with wonted force,
 Thro' sister-spheres the choral song ;
 And, circling his appointed course,
 He rolls in thunder-sweep along :
 The angels hail th' inspiring sight,
 Nor strive to scan unfathomed sway ;
 Thy mystic works proceed in might
 Supreme, as in their earliest day."

GABRIEL.

"And swift, beyond conception's range,
 Swift-circling whirls the glorious earth ;
 And paradisaal splendours change
 To night's deep glooms and phantom-birth.
 The foaming ocean's boundless flow
 Heaves the fixed rock and depths profound :
 Yet rock and ocean onward go,
 Borne on the sphere's eternal round."

MICHAEL.

"And rival storms, from earth to main
 From main to earth contending hurled,
 Weave, in confounding strife, a chain
 Of giant ferment o'er the world—
 And devastating lightnings glow
 Before the thunder's fated way ;
 But, Lord ! with Thee thy servants know
 Alone the calm of changeless day !

ALL.

"The angels hail th' inspiring sight
 Tho' none shall scan thy viewless sway ;
 And all thy works proceed in might
 Supreme, as on their earliest day !"

There is nothing here like the grandeur of

"The cloud-capped towers, the gorgeous palaces,"
 even of Shakspeare's age, and still less of his genius.

We have only room for Margaret's song, exquisite in its simplicity, elaborate, and perfect throughout. We will not ask, Is simplicity so simple as never to rise in the breast of enthusiastic devotion to anything beyond the idiomatic phrases, matchless as they are of the kind, which Goethe has selected ?

MARGARET — alone.

"My peace is gone
 My heart weighs o'er ;

I regain it never,
Never more.

When he is not near
My grave seems here :
And Earth, and all
It offers, gall.

My wretched head
Is agony :
My drooping spirit
Sinks in me.

My peace is gone ;
My heart weighs o'er ;
I regain it never,
Never more !

From the casement sole
My glance would greet him :
And out I wander
But to meet him.

His stately tread ;
His bearing high ;
His mouth of smiles ;
His might of eye ;—

His voice, entoning
Music's bliss ;
His hands' soft touch ;
And oh ! his kiss !

My peace is gone ;
My heart weighs o'er ;
I regain it never,
Never more.

For him my bosom
Will fondly glow :
Then could I clasp him,
Embracing him so ;

Still kissing him
How fain would I,
Lost in his kisses
Die, oh die !"

We cannot go further now. But the distinction between Shakspeare and Goethe is boundless. Great as he was in art, great in German niceties and peculiarities of feeling, Goethe was the great artist after all: his very May-day night contains nothing beyond this; it refers to life rather than to nature, and by preference. His simplicity, delicacy, and skill are wonderful, and his sweetness and mastery over his own language perhaps unsurpassable: but his various studies, niceties, and affectations of universal learning, and of universal wisdom dropping hourly from his mouth, overlaid the real powers of the German. He could not contain every thing in one. Goethe was only the Shakspeare of artificial life; and Germany we think will surpass him yet.

THE recent treaty between England and Austria as concerns the commerce and navigation of both countries is one of the few recent political measures which bear in themselves the germ of happy consequences. It places the vessels of both countries on a perfectly reciprocal footing. All Austrian trade-ships coming from the ports of the Danube, are admitted into British ports on the same footing as British vessels, as regards their cargo; and, on the other hand all English vessels, arriving in Austrian ports are exactly on the same footing with Austrian ships, the same privileges from all foreign countries being accorded to them; so that our merchants are allowed to transport the produce of foreign countries and colonies direct from the native country of the produce to Austria. England has at all times derived the most important advantages from her commercial treaties; and we are glad to perceive in this case, as well as by the treaty recently concluded between England and Turkey, that the maxims by which we attained to our national greatness are not altogether neglected and forgotten.—We would not withhold this frank approval of a measure effected by those whose political opinions are opposed to our own; nor are we by any means inclined to deny the prosperous consequences derivable from the Austrian treaty; though we cannot consider that treaty as a full compensation for the numerous failures and losses suffered both commercially and politically during the administration of our present ministers. We cannot, in truth, regard it as a sufficient compensation for the series of disgraces and disappointments brought upon us by the constant labours of French and other diplomacy, which has succeeded in continually duping the English cabinet for years, and rendering it a kind of political Georges Dandin, contributing to his own disgraces and applauding those who degrade him.—Further, we cannot see in the Austrian treaty a sufficient compensation for the important losses which have been inflicted on our eastern trade, especially since England has so much neglected her interests as to permit a misunderstanding with the Shah of

Persia to grow up into complete defiance and prohibitions of the produce of our industry in the Persian dominions; for they are virtually prohibited, whatever may be asserted to the contrary.

The Austrian treaty is not more efficient, as we noticed before, to compensate for the losses we have experienced by the commercial league of Germany: and as the organs of the ministry have often boastfully inquired, "What will the vaunted commercial league do now?" we shall endeavour in the course of the present article to give a sufficient answer to the question. We need not abuse the patience of our readers with enumerating the voluminous register of mistakes and failures committed in the course of a few years, and for which the Austrian treaty is to prove a compensation; in avoiding this we but imitate the discreet silence of its noble author upon those questions, when, himself stooping to imitate the greatest orator of Rome upon his return from his Sicilian proconsulship, he praises his own merits with becoming eloquence through his own honoured organs of the ministerial press. We do not object to this; for, undoubtedly, the best applause a man can receive is from his own conscience, *i. e.* himself.—Still greater praise is due to the noble secretary for doing good in secret by adopting, without acknowledgment, the regulations of his predecessors as the general ground of the treaty—a proof of political sagacity, too, fully borne out by the fact that the only material deviation from preceding conventions, the only thing new and original, is a clause that savours of impracticability at the moment. In truth the principle which prevails in this last treaty was established between England and Austria in that of December 21, 1829. There are, however, in the present treaty some new points introduced, concerning especially the introduction of products from countries which belong neither to the Austrian nor the British dominion. The reader may best judge of these by the text of the whole treaty, as follows.

"ART. I.—From the date of the ratification of this present treaty, British vessels arriving in, or departing from, the ports of the Emperor of Austria, and Austrian vessels arriving, or departing from, the ports of Great Britain and Ireland, and those of all the possessions of Her Britannic Majesty, shall be subject to no other or higher duties or charges of whatsoever nature they may be, than those which are actually or may hereafter be, imposed on national vessels, on their entering into, or departing from such ports respectively.

"ART. II.—All productions of Austria, in-

cluding the said productions which may be exported through the northern outlet of the Elbe and the eastern outlet of the Danube, and which may be imported into the ports of the United Kingdom and the possessions of her Britannic Majesty; and also all the productions of the United Kingdom and possessions of her Britannic Majesty which may be imported into the ports of Austria, shall enjoy reciprocally, in all respects, the same privileges and immunities and may be imported and exported exactly in the same manner, in vessels of the one as in vessels of the other of the high contracting parties.

"ART. III.—All commodities not the productions of the two respective states, or their possessions, and which may be legally imported from the ports of Austria, including those of the Danube, into the ports of Great Britain and Ireland, of Malta and Gibraltar, and other possessions of her Britannic Majesty, in Austrian vessels, shall be subject to the same duties only which would be paid on these same articles if they were imported in British vessels.

"Her Britannic Majesty extends, by this treaty, to Austrian navigation and trade the full benefits of the two British acts of Parliament passed on the 28th August, 1833, regulating the trade and navigation of the United Kingdom and British possessions, as well as all other privileges of commerce and navigation now enjoyed, or to be hereafter granted, by existing laws, by orders in council, or by treaties to the most favoured nations.

"ART. IV.—All Austrian vessels arriving from the ports of the Danube as far as Galacz inclusively, shall, together with their cargoes, be admitted into the ports of the United Kingdom of Great Britain and Ireland, and of all the possessions of her Britannic Majesty, exactly in the same manner as if such vessels came direct from Austrian ports, with all the privileges and immunities stipulated by the present treaty of navigation and commerce. In like manner, all British vessels, with their cargoes, shall continue to be placed upon the same footing as Austrian vessels, whenever such British vessels shall enter into or depart from the same ports.

"ART. V.—In consideration of British vessels arriving direct from other countries than those belonging to the high contracting parties, being admitted with their cargoes into Austrian ports, without paying any other duties whatever than those paid by Austrian vessels, so also the productions of the soil and industry of the parts of Asia or Africa situated within the straits of Gibraltar, which shall have been brought into the ports of Austria, may be re-exported from thence in Austrian vessels directly into British ports, in the same manner, and with the same privileges as to all manner of duties and immunities, as if these productions were imported from Austrian ports in British vessels.

"ART. VI.—All commodities and articles of commerce which, according to the stipulations of the present treaty, or by the existing laws and ordinances of the respective

states, may be legally imported into or exported from the states and possessions of the two high contracting parties, whether under the British or the Austrian flag, shall, in like manner, be subject to the same duties, whether imported by national vessels or by those of the other state; and upon all commodities and articles of commerce which may be legally exported from the ports of either state, the same premiums, drawbacks, and advantages shall be accorded, whether they are exported by the vessels of the one or by those of the other state.

“Art. VII.—All commodities and articles of commerce, which shall be imported, placed in depôt, or warehoused in the ports of the states and possessions of the two high contracting parties, so long as they shall remain in depôt or warehouse, and shall not be used for internal consumption, shall be subject, upon re-exportation, to the same treatment and duties, whether that re-exportation shall be made in the vessels of the one or those of the other state.

“Art. VIII.—No priority or preference shall be given, directly or indirectly, by the government of either country, or by any company, or corporation, or agent acting on its behalf, or under its authority, in the purchase of any article the production of the soil, industry, or art of either of the two states and their possessions imported into the ports of the other, on account of the nationality of the vessel in which such articles may be imported, it being the true intent and meaning of the high contracting parties that no difference or distinction whatever shall be made in this respect.

“Art. IX.—Grants the privileges of the most favoured nations to Austrian vessels trading with the East Indies.

“Art. X.—Restricts the coasting trade of both states to national vessels.

“Art. XI.—Confers on the commerce and navigation of the two states the privileges enjoyed by the most favoured nations, and provides that neither power shall ‘grant any favours, privileges, or immunities whatsoever, in matters of commerce and navigation, to the subjects of any other state, which shall not be also at the same time extended to the subjects of the one or of the other of the high contracting parties,’ on the same terms.

“Art. XII.—Confirms Article VII. of the convention of Paris relating to the commerce of the Ionian Islands.

“Art. XIII.—Provides that this treaty shall remain in force for ten years, till the 31st December, 1848.

“Art. XIV.—This treaty to be ratified.”

With regard to the condition of our national trade and commerce, we do not believe that this treaty will exercise any material influence upon it. No doubt it will give new life to our intercourse with the Austrian provinces, and direct attention towards the branches of commerce peculiarly connected

with that intercourse; but such changes happen very often in the commercial world, and they are often modified by circumstances of a very inferior description: so that the Austrian treaty, however deserving our acknowledgment, offers, in this point of view, nothing very remarkable. A very different effect, however, presents itself with regard to the influence of the treaty on the *Austrian* trade, and on the *continental* commerce at large. All vessels under the Austrian flag, coming from the ports of the Danube down to Galacz, are to be admitted with their cargoes into our ports on an equal footing with British vessels. This stipulation, if ever it becomes practicable, will give a novel and most important character to the navigation of the Danube. This newly-found commercial road, extending almost 2000 miles in length, (from Ulm to the Black Sea,) is of high importance to the *Eastern trade generally*, and becomes, with regard to that great division of commerce, what the Rhine is now for Western Germany. The privileges bestowed by the treaty on the ports of the Danube will prove a sufficient impulse. Austria will contribute, by all means in her power, to favour the navigation of that river, for the benefit of her industry in general, and for the purpose of promoting the trade of Hungary in particular. Hungary is the most precious jewel of the Austrian crown. The extreme fertility of her soil and the abundant variety of her produce; the advantages of her numerous rivers and lakes, forming natural canals from all parts of the country to the Danube; and, above all, her geographical position, as intermediate between the European and Eastern nations; all these qualifications of the kingdom of Hungary render her highly deserving the efforts made by Austria to rouse the slumbering powers of her industry, and to raise her to that distinguished place in the mercantile world which she ought to hold, for her own interest and the advantage of Europe. The free admission of vessels coming from the Hungarian ports of the Danube into British ports opens the market of the world to the produce of Hungary; and this circumstance will be sufficient to call forth the industrious spirit of that country, which, possessing the most ample resources, has wanted nothing but such an impulse to begin a new era of social existence.

It is of little consequence that the Hungarian territory does not immediately border on the sea; for the opportunity afforded to navigation of the lower part of the Danube renders the countries situated on its banks as open to maritime intercourse as if they were on the sea; and the ports of the Da-

nube, (*Donau-Häfen*;) from Vienna, or rather from *Ofen* down to the Black Sea, (as *Pezth*, *Temeswar*, *Peterwaradin*, *Senlin*;) may be regarded as *really* sea ports. It is true that Hungarian industry, in agriculture as well as in manufactures, occupies still a very subordinate degree; it is, however, well known that the culture of grapes and tobacco, the manufactories for furriery and colouring materials, (crap,) and those of fire-arms, (in *Ofen*, *Pezth*, and *Temeswar*,) are marked points, and will go far to establish the prosperity of that country. We do not say that this prosperity will be an immediate result of the treaty; but it will result in time from the impulse given by that treaty to the intercourse on the Danube.

Austria has extended, with our consent, the reciprocal advantages of the treaty likewise to those ports of the Danube which are below her own territory, and belong to the dominion of *souzerain* princes, tributaries indeed to the Ottoman empire, but who govern their own provinces with sovereign authority. The Austrian government has, doubtless, previously satisfied itself with regard to the ratification of these princes; but there is little fear of contradiction on their part, since they are all acutely aware of their own interests, as connected with their share in the conditions. Austria has, however, given a proof of her sagacity and foresight, in stipulating that the Danube ports, down to *Galacz*, (*i. e.* to the Russian frontiers,) shall be included in the treaty; for by this stipulation she has foreseen and provided for a future connection of the commercial relations founded upon her own treaty with England, and those resulting from the recent treaty between England and Turkey. She has, at the same time, attained another object, in imposing upon the above mentioned *souzerain* princes of the Sultan a certain obligation which hereafter will become the link of a closer intercourse. Among those princes may be specified Prince *Milosch* of *Servia*, who wants nothing but a more extended dominion to approach nearer to a comparison with the *Czar Peter*. He has created the nucleus of a future state, which may, perhaps, rise to unexpected greatness, should circumstances favour its intended development. The prince's efforts to civilize his people and prepare them for future prosperity deserve the highest praise.

Servia, a *terra incognita*, is growing up with silent but astonishing rapidity, and, with *Dalmatia*, into high political importance. *Servia*, which, twenty years ago, was, with regard to its intellectual and industrial culture almost barbarous, has made immense progress in public instruction, administrative

order, and industrious activity. Doctor *Münster*, of *Augsburg*, has been engaged to come to *Servia*, in order to establish schools and other institutions for public instruction. The administration of justice has been highly improved by dividing the country into districts, and providing each with an administrative and judicial tribunal, controlled by a central authority. Encouragement has been given to commerce and industry: and Prince *Milosch* has sent agents to the different continental capitals, and likewise to *London*, in order to establish commercial connections between *Servia* and other countries; a considerable transaction, for instance, took place a year ago, between a *Servian* agent and a *London* company, concerning a quantity of materials for ship-building.

If the results of these efforts have not yet been sufficient to place *Servia* high in the political and commercial world, they have nevertheless deserved and obtained the attention of several cabinets of Europe. *Russia* and *Austria* have struggled for the prevailing influence with Prince *Milosch*; but it would appear he has succeeded in maintaining his independence, and enters into no special obligation with either of these powers. But however he may have been induced to favour *Russia* in particular cases, in order to avoid dangerous collisions, the interests of *Servia* are rather connected with *Austria*. The aim of the former must be to obtain an independent position as regards the Ottoman empire, and to become, with the aid of time and circumstances, of some, though but minor importance, in the diplomacy of Europe; this can only be obtained by the aid of *Austria*.

The position of the other principalities, *souzerains* to Turkey, is very similar to that of *Servia*; they are all in a state of semi-barbarism, and in their political and social infancy; they all aspire to a higher degree of civilisation and political emancipation from Turkey. But though *Servia* is one of the smallest of these states, and less important with regard to her actual forces, she is the only one that makes visible and consistent efforts towards her objects, and it is for that reason we have mentioned her above the other, more extended, and with regard to their present state more important principalities. The latter offer few substantive features, and we need only add that all these last principalities are in a condition which renders the epoch of the Austrian treaty a regenerative moment in their social life; as, in virtue of Art. 4 of that treaty, they are for the first time concerned in a formal commercial transaction, which turns the attention and the interest of England—the queen of commerce—towards them.

Undoubtedly so shrewd and active a politician as Prince Milosch will do all in his power for the purpose of attracting the mercantile navy of Austria and obtaining his share of the advantages resulting from Art. 4 of the treaty; a share which, with time and opportunity, may become very material. The importance of Servia will strongly affect Greece. But the encouragement of the navigation of the Danube, resulting from the Austrian treaty, will exercise its principal influence upon the condition of German commerce and industry. The dominion of the Danube and its dependent streams comprises the most industrious provinces of Germany; Suabia, a part of Franconia, Bavaria, Tyrol, Steyermark, Carinthia, and the Archduchy of Austria.

We trust to explain in the course of this article the actual views of Austria, to unite the commercial interests of all these countries and direct their intercourse towards her own dominions. The fact that many of the countries bordering on the Danube are now bound by the Prussian League, cannot form an obstacle to her views; for the advantages which she will be enabled to offer them are far more important than those resulting from the League, and they will in consequence probably withdraw from it at the earliest opportunity: this is not far distant, as the first term of its existence is at hand. It is evident that all the efforts of that Union to become an independent power in the commercial world, and to satisfy the industrious wishes and wants of its members, will be vain and unsuccessful so long as the League cannot succeed in uniting with its territory the countries which border immediately on the sea-coast. The Prussian ports on the Baltic are so far distant from the commercial and industrious movement of Germany that they by no means obviate the want of an immediate contact with seafaring nations. The League remains therefore in a state of dependency upon those countries which have the advantage of immediate communication with the sea; and these last, standing in no want of the services of the League, whilst this needs their concurrence for admission to the sea-ports, are entitled to prescribe the conditions of that admission, to which the League is obliged to yield. The principal ports of the German Ocean, Hamburgh, Bremen, the whole coast of Hanover, have to this day resisted the Union; and they will always resist, because their dominions possess such great advantages over those of the latter. It is only with their permission that the League can take a share in the maritime and universal trade, and without

their assistance it would be confined almost to its own frontiers. This is indeed but a state of half-existence for a commercial institution; and the industrious countries which have formed the League are so fully aware of this great advantage, that they are above all desirous of an opportunity to obtain a free admission to the sea, and, consequently, to universal commerce.

We may notice, by the way, that these remarks tend to illustrate the double position in our last number; namely, that the commercial policy of Prussia in the case of the League, was essentially erroneous and selfish; and that though it did for a time, as we noticed, aid the commerce of a part of Germany, yet that commerce was artificial in its origin, and therefore probably will be contracted in duration. Our own opinion of the countries in question seeking to share in the bolder scheme presented under Austrian auspices is shared by the able correspondent of a morning paper high in the confidence of government, who, however, assails our last article with no measured warmth of language: *tantæne animis celestibus iræ?*

But whether the League be dissolved, or permanent, hereafter, we would observe that neither case affects the question of arresting in the outset the acknowledged injuries it has done to our commerce hitherto.

To return: Austria having established, by the treaty in question, her intercourse with the country which presides over the navigation of all nations, can offer to the states alluded to advantages which they have looked for in vain from the League. She can open to them the Mediterranean through the port of Trieste; she can open to them the Black Sea through the Danube; and the ports of the latter being entitled, in virtue of the treaty, to a free and unrestrained intercourse with the ports of Great Britain, are for the German States gates opening into the domain of universal commerce; the more so, as the water-road of the Danube is accessible for almost all Germany; the range of the Danube and its dependent streams being not only extremely extensive in itself, but comprising also the countries situated in the neighbourhood of the Elbe; since a railroad from Budweis to Linz has brought these two rivers into intimate connection.

Such are the general and principal views which the Austrian Treaty opens to the continental trade. We shall have an opportunity of developing some of these more particularly in the course of our article; but we repeat that the treaty, however advantageous in itself, will not exercise a *great*

and *immediate* influence on the commercial and industrious state of England.

The ministerial organs in truth have not only much exaggerated the commercial and industrial importance of the treaty itself, but they have endeavoured to present it in a point of view which utterly misstates the political condition of Austria. It has been boldly and broadly intimated that the treaty is the result of a victory won by Whig policy in its conflict with the conservative spirit prevailing in Austria; and that the latter, filled with panic terror by the revolutionary events in France, Belgium, and the Peninsula, and by our own former liberal tendency, had now been *reassured*; nay, that she has been converted to somewhat of Radicalism by the able diplomacy of our agents! "Our own liberal policy and reforms (these are the authentic words of a semi-official periodical,) had alarmed Austria and thrown her altogether into the arms of Russia; but now Austria having recovered from that panic-horror of revolution into which the events of the last ten years had thrown her, Prince Metternich and his sovereign have both become alive to the encroachments of Russia beyond the Danube, and our diplomatists have taken the earliest and best advantage of their feelings to conclude a treaty defending the joint interests of Austria and England."

These words, apparently trivial, are no less extravagant than unjust. They are intended to exaggerate, at the expense of Austria and her ministers, the talents and merits of our own; but this language serves only to compromise our national dignity and provokes ridicule in the continental cabinets. We have always regarded Austria as the most solid and estimable of the continental powers; and a close and intimate alliance with her has ever been considered the most powerful basis for maintaining the political and social interests of England. But there is little hope that such an alliance between England and Austria as now formed can be permanent. A deadly contradiction and discordance exists between the leading principles of Whig government and the political system of Austria; and the great statesman whose genius rules the Austrian empire will never consent to compromise his *conservative* principles.

Nothing in truth can be more false or erroneous than the impression indirectly sought to be introduced into the official interpretations of the treaty; namely, that the Austrian government in concluding it had made some concessions to the political opinions of our diplomatists, or that it had in the slightest degree relinquished its ancient

maxims of conservative policy. Those maxims have been for several generations the basis of her governmental system, and to them she owes her greatness; with them, as with a spiritual tie, she has linked together the various nations and countries forming her empire, uniting them in one powerful organic system, by which she has become the arbiter of European politics. The Austrian treaty might indeed have been, under different circumstances, the first step towards the future establishment of an intimate and more important alliance of the political as well as commercial interests of both countries.

But in considering the real nature and origin of the treaty before us, a single glance on the political position of Austria will be sufficient to show the error of representing her as agitated by panic-terror during a period when she most strikingly displayed her superiority to such emotions. Far from trembling or throwing herself, as pretended, into the arms of Russia or any other protecting power, she has continually exhibited, during the agitations of Europe, a dignity and moderation inseparable from the consciousness of real power and greatness. The behaviour of the Austrian cabinet with regard to the political agitations which since 1830 have taken place in Germany, is in itself sufficiently interesting to deserve a careful consideration.

Many circumstances then contributed to complicate the task of the Austrian government in the case of the political convulsions of Germany: she had not merely to resist the anarchical efforts of the German demagogues;—this was indeed comparatively easy,—for German spirit is always adverse to the naturalization of that exotic poison, denominated revolutionary propagandism. The Germans are essentially gifted with a methodical and reflecting disposition, which unfits them for becoming tools to the ambitious schemes of demagogues. Those who had been infected by the revolutionary contagion remained isolate; and as their projects found no sympathy with the people, the little chance they had of success could create no serious uneasiness in the mind of Austria. But much more difficult and delicate was the position of this power with regard to her ambiguous ally and rival Prussia. The cabinet of Berlin, far from assisting the efforts of Austria for pacifying the territory of the German confederation, did, on the contrary, all it could to raise difficulties in the way of that pacification; and whilst Prussia dissembling in the German Diet as well as in her conferences with the Austrian cabinet, pretended great zeal for

the maintenance of the Austrian system in Germany, she was actually endeavouring on the other hand, to flatter the adversaries of that system by a display of mock liberalism, and by the arts of political coquetry towards the spirit of innovation rising in Southern Germany. Besides these difficulties, from a quarter from whence she ought to have experienced the promptest assistance, Austria was obliged to deal with the whims of the king of Bavaria, who, having been formerly deeply compromised in the political intrigues that tended to overthrow the confederative constitution of Germany, still retained many reminiscences and connections of that period; and, jealous in maintaining the show of sovereignty, often crossed the most important measures for the mere purpose of satisfying his vanity. The most difficult part, however, of the obligations of Austria during the period in question was, the maintenance of her political system in the legislation of the German confederacy, which was exposed to continual attacks and threatened with mortal encroachments on the part of the legislative chambers of Southern Germany, where the spirit of unprincipled innovation, and a wild tendency to destroy the ancient foundations of social and political organization prevailed. Austria obtained success without any display; she protected her own territory and the dominion of the German confederacy against the revolutionary contagion by moderation, prevention, and energetic resolution. Public opinion in Germany has judged with equity between the conduct of other governments and that of Austria. The discontent and disaffection created by the interference of governmental authority with the anarchical or innovating tendencies of political parties have manifested themselves exclusively against those, whilst the Austrian cabinet, having always maintained its dignity, is regarded with esteem and even affection; for the ancient ties of loyalty and mutual regard, which, during the period of the German empire, linked the interests of the House of Austria with those of the German nation at large, are not yet forgotten; that feeling of ancient fidelity, with which they regarded the emperor as their feudal sovereign and supreme chief, still lives in the hearts of the German princes and nobles; and neither the machinations of scheming rivals, nor the mania of innovation in the democratic parties, can eradicate it; thus the interests of Germany at large are intimately connected with those of Austria. By her influence also several new institutions have been introduced into the German confederacy, and all of them have the

unquestionable tendency of doing justice towards all classes and parties. We take as an instance, the Arbitrary Court of the German Confederacy. This was created, October, 1834, in order to give to the subjects of the constitutional states protection against every abuse of governmental power, and to settle lawfully and peaceably any difficulty arising between the governments and the legislative chambers.

By a system of equal policy and moderation Italy has been to some considerable degree reconciled to Austrian supremacy, especially by the temperate conduct of the latter power in the last revolutionary movements subsequent to 1830. The states more immediately under her sway thus conciliated, and particularly by the well-judged amnesty of the present emperor, the neighbouring countries also have been satisfied to consider the Austrian power as the arbiter of their differences and difficulties.

Such is Austria, uniting under her immediate dominion some of the most flourishing countries of Europe, with a population of more than thirty millions, and ruling over the destinies of two great nations besides her own proper dominion; her dignity and influential authority established and maintained in every cabinet of the world, her alliance solicited even by those who cannot conceal their dislike, and her power feared by her enemies. Such is Austria, the chief and foremost of that political system which is called conservative, because it aims at preserving the natural and organic development of the life and of the destiny of nations and countries.

Prince Metternich manifested his opinions concerning commercial leagues in general, even at the time of the conferences at Vienna in 1820; and especially explained himself most decidedly with regard to the project of Prussia, as to a commercial league between the members of the German confederacy; declaring without any ambiguity, that he considered it by no means advantageous to the confederated states. The Austrian cabinet has always remained adverse to that union; for it has ever been the prevailing opinion at Vienna, that Prussia has created it for the purpose of increasing her influence in the interior affairs of the smaller states of Germany, and of counterbalancing, by cunning and intrigues, the open prevalence of Austria.

It is in the most complete accordance with our convictions concerning the Austrian policy, to consider the treaty as concluded on the part of Austria in order to oppose to the system of commercial leagues or unions, such as it has been established in

Germany, a system of commercial *treaties*. The most striking difference exists between these two. The former (that of leagues) is founded upon the principle of ruling, by confederative laws, all the commercial affairs of every country comprised in the league; it binds all the members of the league, with regard to their national intercourse, and obliges them to confine their commerce and industry within the bounds of the confederated legislation; it compels them also to bar, by duties and difficulties, the produces of other countries from their frontiers. But the worst consequence of the system is, that it aims unavoidably at ruling, besides the commercial affairs, the politics also of the members; commerce and politics are in a necessary and natural reciprocity; and as the more powerful member of every union has always the advantage over the weaker, the commercial leagues tend directly towards a system of commercial and political tutorship, exercised by the more powerful over the rest. It is quite otherwise with the system of commercial treaties, which, founded on the principle of leaving to every country the free and independent management of its own affairs in commerce and politics; and exacting only a reciprocity of free intercourse between the contracting nations; it remains at the disposition of each of these to conclude with foreign countries as many similar or other treaties as they find convenient. Whilst commercial leagues are only conducive to emulation, jealousy, and discord, commercial treaties are to be regarded as the direct steps towards universal intercourse.

It was not, however, our own intention to intimate that the conduct of Prussia had politically no tendencies whatever to the general benefit of Europe. Anxious always to increase her influence, so cruelly crushed for a time, she took advantage of the treaty that had wrested from Austria the actual sovereignty of Germany, and as the states previously under the influence of the latter grew and strengthened in their novel independence, Prussia, by adroitly seizing the new-born desire for commerce and manufactures, has certainly converted the league, not only into a commercial but a political engine also to aid her resolves of emancipation from Russian influence; and, as we have already stated in a previous Number (Oct., 1838,) her policy has been completely successful. She has on all occasions resisted the attempted encroachments of Russia, whether to steal into the German confederacy as sovereign of Courland, or to extend her already enormous and ill-gotten

sway over Poland; as she formerly refused, in spite of the family connection, to assist Russia in the campaigns against Turkey. "The emperor relies on your majesty's support," said the Russian intriguer, "because he is your son-in-law." "That is true," replied Frederick William, "but I do not give it because I am his imperial majesty's father-in-law."

The object of Prince Metternich in the renewal or formation of the treaty, is doubtless in part to strike a blow at the union itself.

A more than sufficient compensation would be found for several of the states included in it if they could be included in the Austrian treaty with England. Such is especially the case with Bavaria, the most powerful of the German states after Prussia. Every one at all acquainted with the trade and commerce in Eastern Germany, and especially with the particular nature of the Bavarian industry, will perceive at a single glance how seductive such a temptation must appear to Bavaria. The advantages she derives from the union are not to be compared with the important consequences obtainable if she could send her produce through Tyrol and the Adriatic seaports (Triest, Venice, &c.) to every country which wants them. The example of Bavaria would be in itself an inducement for the smaller states; the latter could be induced to prefer a treaty with Austria and England to their union; especially those smaller countries which are bordering on the Baltic and the German Ocean.

We regard the approaching term of the Prussian union as affording ourselves the opportunity of forming a treaty with Prussia upon equal terms. We can never too strongly reprobate the fatuity that, under the enlightening influence of liberalism, induced the whig government of a former day, under the inauspicious theories of Mr. Huskisson, to open our colonial ports to the nations of the continent unreservedly. The consequence has been that Prussian vessels have imported into them the cottons and tobacco of America and their own manufactured goods, at little cost, to the injury and destruction of the colonial interests of Great Britain. In Wurtemberg, where ten years since the natives were emigrating in crowds, the manufactures are now flourishing and all hands busily employed at home. Bavaria is similarly advantaged by the same cause: and while the genius of universal philanthropy, whatever that may be, rejoices in the improvement so effected, she (or he, for we know nothing of the existence of this

very sympathetic personage,) must not be allowed to forget that it is effected at the expense of our own suffering countrymen.

So long indeed as this unlimited freedom is given her, Prussia may safely smile at the treaty of England with Austria as regards herself. The inconveniences of secession from the League would be visited by her upon the seceding states, and a permission to import her corn from the Polish provinces would far outweigh any loss that could accrue to her from the treaty in question.

Her anxiety indeed upon this last question is great, and there is in it one material consideration ; namely the opening, though indirectly, the interior of Poland to English trade, and consequently inducing a tolerably close connection of interests between the latter country and Great Britain ; but this is a purely political question.

On the mooted point, whether the abolition of our corn laws would be fatal to the agricultural and manufacturing interests of Prussia, as asserted by one party, who are desirous of the continuance of those laws, considering the high price here to be favourable to the development of Prussian industry ; while their opponents contend that a moderate price would become permanent by the abolition demanded, and benefit industry proportionately by bringing more money than at present into the market, since consumption would rise in proportion ;—we need not dwell at any length here, as the question is settled for a time. But with regard to Germany it has been said, if we allow a free importation of corn, the Germans will be able to take more of our manufactures in return. They may undoubtedly be able, but the difficulty is, will they be willing, and with the asserted hostility as regards Prussia, will they be permitted ? Our own opinion is, that if the Germans were enabled, by obtaining a larger profit from their corn, to expend more money in the purchase of manufactured goods, they would purchase those of their own country in preference to those of England and Scotland, the cheapness of which no longer allures them as it used, now that they are aware of their want of durability, of the deceitfulness of the gay colour, which disappears at the first washing, and of the fraudulent practices employed to give them an appearance of value which they do not intrinsically possess.

Our Glasgow merchants could doubtless explain all this, if they would.

Brunswick and Hanover, boasting little beyond the produce of the Harz mountains, and too poor for a port, yet rely upon the

single support of Hamburg, itself an eyesore to Prussian combinations, and threatened with extinction by Prussian jealousy. The two countries first named, though they would most unquestionably be great gainers by joining the Confederation of the League, have yet stood firm to the interests of Great Britain ; the latter too, fortunately, under a sovereign connected so closely with the British crown, and indured from infancy by birth and station with British patriotism. The attempts that have been made, therefore, in certain quarters, to sever the connection of the two states, might, if successful, have had the effect only of injuring ourselves.

France also, and with reason, complains against the German Commercial League ; for by its influence she greatly suffers in commerce and manufactures. From 1828 to 1832, (previous to the establishment of that system) her exports to Germany increased from 36 to 49,000,000 francs ; but subsequently, that is to say in the year 1837, they fell to 36,000,000 frs., according to the latest published result of that year. The transit-trade of produce or manufactured goods through French ports and by land carriage amounted in 1834, to 4,000,000 frs., and was reduced in 1837 to 3,000,000 frs. Her uneasiness, therefore, cannot be wondered at. Meantime, the commerce of Holland with Germany by the Rhine has increased so much, that it now employs 82,000 tons of craft.

With regard to France, we cannot but consider the conclusion of the Austrian Treaty as in some degree a mark of English feeling, roused at length with our ministry, at her eternal evasions and insincerity on every point, and, not least of all, her conduct in the affair of the Quadruple Alliance. We should also throw out a hint upon a matter well deserving the most serious consideration, and far more important than it seems to have been hitherto considered. We mean the competition existing between France and Austria respecting the transit of English steam communications. Austria is by nature and position our ally, and still more firmly than ever under existing circumstances, now that she perceives the good sense of the nation exerted to stop the progress of those baneful measures that since the unhappy era of the Reform Bill, have offered a means of turning England, and through her, half Europe, into anarchy and republicanism. Austria is now reassured ; and her own necessities and those of England in the Eastern question link the interests of the two countries into one permanent bond. The outcry raised formerly, by Whigs

and Revolutionists equally, in England against Austria seems to have subsided the instant the policy of her able statesman became known. His extraordinary talents and profound caution have saved his country from a formidable revolutionary crisis, and preserved to her the happiness of her people, proverbially the happiest in Europe. After the wild and unmeaning abuse so long showered by one portion of our countrymen against this unrivalled statesman, it is a strong indicative of returning reason to perceive our ministers grasping the hand of brotherhood with him whom they had so long abused.

Of France we need say little ; her political jealousies are known ; her shameless abuse of treaties and good faith towards England in particular, are borne out more than ever by recent events at Buenos Ayres, the particulars of which have not yet come to full light ; but they seem intended to overturn the British influence and interest there. It ought not to be forgotten how anxiously she has toiled in the same path for years. Buenos Ayres seems her especial object ; for we must recall to the mind of our readers how an intrigue, having for its object the destruction of British interest in that very country, was brought to light some years since by one of the numerous revolutions that occurred there : the papers were published, and it was found that they were signed by the French Foreign Minister, Decazes, if we remember rightly. The discovery reached the English court the day before the arrival of that very minister as ambassador to the king of England, to whose ministry, too, he had been making the most solemn protestations of good faith and French honour, upon that very subject, immediately before quitting the bureau of foreign affairs.

The questions of Egypt, and of India, are of no slight importance to France ; and if the English mails are to go through her dominions, who can answer for the integrity of those communications ? Did not an unfortunate error throw, some years since, the letters of various southern refugees, entrusted to a well known English wandering and political character, into the hands of the French Government ? That the letters themselves were of very questionable tendency there could be no doubt, and so far the act was justifiable. But what has caused the recent stoppage and detention of the English messenger, and the abstraction of the English mail from him for two days, in the south of France by the authorities ? A mistake no doubt ; for so it has been explained and apologized for ; and John Bull

is to believe it and feel very happy. But France never makes these mistakes without deriving all she wants to gain from them, and such mistakes occur whenever they would be convenient to her objects. Witness the mistake of the Mexican affair made by the Prince de Joinville owing to inexperience ! Is France so heedless of her navy just now as to trust it to inexperienced hands ? Or is the son of the astute, able, and accomplished Louis Philippe,—is a French prince, of the blood-royal of France, brought up usually in such ignorance of the law of nations as would disgrace the humblest gentleman in France !

We strongly, therefore, urge attention to the very suspicious “mistake” of the English letter-bags ; and if some difficulties were to arise to-morrow in the East, or with Egypt, who would guarantee that another opportune mistake might not be made ? Are not the practices of secret information in France notorious ? Where agents of the police mingle with the guests at the tables d’hôte, and report the conversation of guests, as we have means of knowing, or visit with false keys the trunks of the traveller during his temporary absence from his chamber. Throughout France the dissatisfied complain more of the system of espionage than of all else ; and are British communications to be rendered liable to this, when Austria is open to us ; Austria, whose faith has never been denied or doubted ; Austria, the most open and honourable government of the continent ?

We are happy to see that the trade of Austria, already in a certain degree flourishing, is receiving a new impetus from the effects of the Treaty, and from the wise efforts of her government to raise a mercantile navy, as a supply, should occasion require it, for a larger naval warlike force than she has ever hitherto had occasion for.

“The number of merchant vessels belonging to Austria at the end of 1838, was 498, with a total of 122,844 tons ; the number of steamers was 15, total 5,114 tons.

“Out of the 498 vessels, 155 were employed in trading to ports in the Adriatic, the Levant, and the Archipelago : 147 in the Black Sea, the sea of Azof, and the Danube ; 167 in the Mediterranean ; 12 in the Atlantic ; 4 in the Northern Seas and the Baltic ; and 13 to America.”

The consideration of a nursery for seamen is of the greatest importance, as Austria, now becoming, what she has long desired to be, to a certain degree a mercantile power, must from her connection with Italy, if pushed to the extent she herself designs it, as Protectress of a Confederation, be prepared to support her authority there as well

as in the face of foreign nations, by a command of the sea as of the land. To what extent this can be done remains as yet a question; but the progress of her trade with Turkey, &c. through the Black Sea and the Mediterranean, will impose new duties as it forms new rights. And it is clear that her government did not adopt the present system without a full determination to act up to it on all points, as is shown in the introduction into the treaty of that condition which requires the concurrence of Turkey to render it available. Cautious as the Austrian Government has ever been in all its foreign measures, more especially as regards the latter power and Russia, it is obvious that considerations for this last do not now interfere to check her favourable disposition towards the Ottoman Empire. Time will show whether this is not something more than a mere commercial compact.

With regard to Russia, as the question is chiefly political, we refer the reader to our article on the subject in another part of our Number.

ART. VIII.—*Del Brittiska Riket i Ostindien.* (The British Dominions in Hindostan.) By Count M. Bjornstjerna. Stockholm. 1839.

SINCE our two last Numbers were published so formidable a crisis has arrived and passed from our Oriental possessions and connections, and the first impression of relief from perils apparently imminent has naturally produced so strong and corresponding a confidence in a state of repose, as obtained at least for a time, that whilst the former occurrences have in their rapid succession mocked in appearance at all calculation, they have also enhanced our disposition towards present indifference. This last, in truth, is not altogether surprising under the actual circumstances; for if dangers can thus approach and vanish, and changes so swiftly succeed each other, as though effected by an inexplicable power and the wand of a magician, they must have in their nature a considerable affinity to phantasmagoria, which assume such menacing forms and yet prove, to the very eyes they have threatened, absolute exaggerations conjured up by art.

It is not indeed in the nature of things to avoid this obvious conclusion; for if such dangers were apprehended where so little ground for alarm exists at the moment, there must have been exaggeration some-

where: not wilful, probably, but incidental to the discussions and resolves arising out of real occurrences happening at a distance; of which, too, no certain or regular information could be had, even at our nearest eastern settlements, by the public; and whose consequent incertitude and anxious doubts, still further perplexed by perpetual contradictory rumours, magnified each object of contemplation seen through its haze. By these imperfect channels came our only supplies of intelligence, and it is not to be wondered at, therefore, if our ideas were confused and our judgment misled. Equally distant from the theatre of events and the sources of our information, it has scarce been sufficiently borne in mind by the English public, that those two points formed the base of a very extensive isosceles triangle, the lines of both whose sides were constantly rendered vague and indistinct by their prolongation across such vast distances, to their apex in Britain.

Since, then, the difficulties which seemed so immediate have vanished, even without contact, we need hardly repeat that our estimation of them must have been incorrect; and that this incorrectness must have arisen from miscalculation of the powers or objects acting in opposition to our interests. There is no escape from these conclusions. Either Persia was less hostile, or else less strongly supported by circumstances on the one hand and by Russia on the other: and this latter power, consequently, was less able, and, not impossibly, less willing, than she had been supposed, to employ violence against British power in the East. The exposure that has taken place of the weakness, and, however originated, the pacific dispositions of Persia, has also exposed, as distinctly, the weakness, if not the pacific dispositions of Russia in that quarter: and it is a strong argument against those who insist on the matchless foresight and skill of this last power, if she has urged on her ally schemes so daring, and developed openly in herself ambition so vast as imputed to her, with such paucity of means to support it. The attempt, if really made by the Russian government, was the grossest of errors of infatuation and cupidity; and the recoil of failure, however produced, has humbled and degraded her as much as it has exalted her rival: this, too, not only in Europe but the east: not merely amongst nations capable of appreciating facts, but also, and worse, amongst barbarian tribes, who have neither means nor intellects to judge of any such questions except by the immediate success.

For a power so strong as is asserted of Russia to have failed so soon and so signally

on a point upon which she had set her hopes and her interests, is a problem the solution of which requires us to cast our eyes back upon the events of these few months. Our last article on this subject (NO. XLIII.) distinctly pointed out the peculiar position of Russia, both internal and as regarding foreign nations in past and present times: and we argued that the very circumstances which made her existence aggressive, precluded her also, like the gigantic monsters of former periods, from a power of rapid locomotion, destructive to the world. Every defect of her internal and external position which we then noticed, has actually been proved in the rapid interval of scarcely three months. The commercial coldness and political suspicions of Prussia; the conspiracies in Lithuania and the whole line of Russian Poland; the distinct working of Austrian opposition; the rallying energies of Turkey; the indomitable hatred of Circassia; the disaffection of the South-Russian Cossacks; the explosion of hostility in the Caucasus; the imbecility and intestine dissensions of Persia, and her doubtful faith; the superior prowess and ultimate success of the Affghan and Turcoman tribes; and more than all, the rebellious state of her native armies; all these have been exemplified incontestably of late, and all have shown that Russia possesses no energies for a distant field, if only common care is taken to embarrass her on every point of her weakness.

If we quoted against one portion of our opinions the military opinions of Marshal Marmont, we also supported our own by that of an equally able military judge; and the Marquis of Londonderry had this advantage over his gallant rival, that with an admitted power of military *aperçu*, a clear scope and keen eye as to the real position and value of warlike circumstances; qualities which recommended him, as ambassador to Russia, to the unquestionable penetration and honesty of the Duke of Wellington;—he has been on the spot, and witnessed the financial weakness and unwieldy dislocation of the Russian empire; defects which required the efforts of the government to be devoted to internal consolidation. The very failures in the east, noticed at our outset, are evidence of this and assist the solution of the question, How has Russia, with so much power and so much skill, so signally failed in a darling object? The obvious reply, which would refer this to common weakness, is manifestly derogatory to her imputed tact, skill, and foresight. And yet these she certainly possesses.

The real solution of the question, we conceive, lies somewhat deeper than the bare surface, and may be found in the composition of the different parties that sway the interests of the country as their alternating influence points.

There are in Russia two sets of antagonist principles, to whose motive we have made some allusion in our preceding article, but which we propose to consider here at somewhat greater length.

The antagonisms we have referred to are, first, of the so-called Russian and German parties; and next, of the monarch and his ministry.

The Russian party, which, as its name denotes, consists entirely of natives, is jealously vigilant of its rivals, and, for the most part, entertains the strongest antipathy towards anything like foreign intervention or dictation in the concerns of the empire. It is subdivided into various classes.

The great nobility, proud of their wealth, influence, and domains, holding themselves as the actual guards of the sovereign and the real rulers of the state, though under the thinnest of possible disguises:—they hold themselves, so to say, accountable for the acts of the court, if not of the government, towards their own nation on the one hand, and towards foreign states on the other; and, whatever may be their mutual rivalries, always agree on the one point, that the government of Russia should be less monarchical than oligarchical. Confident in their former glories, and their present influence and real weight in the empire, they are ever disposed to look upon their sovereign but as the nucleus and motive power of their own will, and the source from which lustre is derived for themselves; in short, the mere basis of their own elevation and stability; to which last, however, every thing else, the sovereign included, must become a sacrifice when necessary. These families, who have always played a conspicuous, and always, too, a fatal part, in the lifetime of Catherine and in the deaths of the Peters, Paul, and Alexander, even too in despite of their personal attachment to the last, have felt not less astounded than mortified and degraded at the bold hand with which Nicholas grasped the reigns of power; when with a skill and decision for which history has but few parallels, he arrested and compelled the elements of discord into one firm and compact mass, and held it pressed so sternly beneath his foot that they who had calculated on restraining at least, if not rivalling and directing his course, durst not even show their heads at the moment above the station assigned

them. The least whisper of combination and the offender would have been crushed at once. They sunk, therefore, from an oligarchy to courtiers; but retain in their subject state their ancient failings and aspirations—for supremacy at home and foreign refinements.

The Boyars or Agrestic nobility, on the other hand, remain attached to their ancient usages and barbaric magnificence: foreign manners and luxuries are abhorred, and the word Russian is with them the sole designation for all that is desirable. They love their monarch because he is a Russian; adhere to old customs because they are Russian; treat their boors or slaves in the Russian manner; and think Russia the arbitress and exemplar of the world. Their regard for the sovereign would be devotion, if he did not employ and encourage foreigners in his service; but this is a serious objection to him.

The Army contains an ample portion of the foregoing parties; considerably modified of course as to the oligarchy of the one and the isolation of the other class, but with causes of discontent peculiarly its own; and arising from the perpetual contrast between the severity and privations of their own service, the absolute destitution of distant stations and hopeless absences, with the comparative luxuries of other lands of which they have more or less an actual and a traditionary knowledge. The rustic officers are proud, ignorant, independent; the scions of the great nobility restless, enterprising and ambitious; extravagant in their habits, and impatient of the control to which these are subjected: they are brilliant, thoughtless, dissipated, presumptuous, embarrassed; and hence, revolutionary.

The army is confident in its numbers and recent successes abroad; in its sympathetic organization at home: constant correspondence is kept up between the various regiments; and this correspondence is materially aided and promoted by the nobles, who look upon it as their future tool, and a present counterpoise to imperial authority.

The large class of Civil employés in the Russian service is in its lower grade selfish and brutal, in its upper dexterous and artful, half educated and intriguing. Poor, and anxious to amass fortunes, they are universally corrupt, and eager to attract notoriety, because this leads to eminence and comparative wealth. There is nothing, consequently, within their range of sight, that they do not strive to grasp; and, like all semi-barbarians, believing their own land to be the only one, are universally strenuous in their efforts for

national advantages as the sure path of private interest. Every family of the smallest standing has connections in this class. They love Russia beyond every thing, but themselves.

These men, too, hate England for her commercial riches, and scarcely less for her reputation.

The Russian boors are a simple, happy, hardy, ignorant feudal race, who hold the Emperor as God, and regard the cudgel as his especial revelation.

On the other hand, the foreign or German party, as it is called, is distinguished for honesty and fidelity to the sovereign, the source of their honours, means, and hopes. They are his Prætorians—in the best sense of the term. Anxious for his interest and their own, they are ever ready for active service, which is opposed by the national party out of jealousy to them alone. Hence arises a continual vacillation of councils within the empire, though the despotic form of the government prevents its being often perceptible without.

We now proceed to the second antagonism.

The ministry is an intermixture of characters of the first and third classes of the native party, with a small proportion of the foreign—they are the oligarchs of place, not of birth, and fain to control the sovereign rather than be controlled by him: they are intriguing, adroit, ambitious, and vain glorious: possessing the true employé spirit, they are ever scheming for national and individual advantages. Hence they are constantly acting independent of the sovereign, and of each other, but all uniformly busied in every species of foreign intrigue.

No one who has approached the Emperor can doubt his character or talents. Amenity and kindness, frankness and affability, joined with a high will that never stops at half measures, but exerts and declares itself almost too unreservedly. Nicholas may be a master of concealment and artifice, but those who know him best do not pretend to have discovered it, and consider simplicity his characteristic rather than reserve. Abilities and intellect of the first class, and station so high as to have left him no cause for stooping, seem to vindicate this opinion. The subtleties of Alexander's character were the offspring of an extremely difficult position, and the reverses of his foreign policy; yet even he, though artful and ambitious, was affectionate in spirit, and true to his engagements. He left Nicholas no difficulties to contend with, except we call such the imperfect cohesion of the different parts of the empire, and the management of his ministry.

It is, however, unquestionable that the conduct of Russia has been of the most doubtful faith during his reign ; and that changes of principle have taken place, and opposite lines of conduct superseded each other, to the just scandal of the Russian policy ; but the defect is in the system, and not in the personal character of the Emperor.

Though the native and German party both agree as to the expediency of foreign acquisition and aggrandizement, they differ most widely as to the means and instruments ; and each would rather sacrifice the end than see it obtained through the medium of the other. Hence supplies have failed, provisions been wasted, the wounded have perished, commanders been paralyzed, and armies reduced to corps, because the leaders' political opponents were entrusted with his supplies ; thus Wittgenstein was thwarted and disgraced ; and thus Diebitsch, who covenanted for his own party before he would undertake the Turkish campaign, was ruined in Poland by his adversaries being in power. Thus, too, the changes and fickleness in the negotiations with Persia originated in the choice or displacement of a minister anxious chiefly to discredit his predecessor. The silence of a despotic system concealed the cause, and often rendered the baseness of an individual apparent only as the perfidy of the government.

But if this struggle of parties refers more especially to less recent times, the events of the present day take their origin in the antagonism of the Emperor and his ministry. Willing as we are to give Nicholas credit for generosity of private character, and openness amounting at times to even furious vehemence, we should be the last to deny that the steps of Russian agents have not exceeded in perfidy, fraud, violence, and baseness of every kind, all that is related in history. Where indeed can a spot of British possession be pointed out, in which they have not been sowing the seeds of future discord and disaster ? What neighbours and allies have they left untried to detach from British connections and British interests ? What arts of falsehood, insinuation, corruption, perjury, and forgery, have they omitted, to raise enemies to England in the very bosom of friendship ? Is there one spot of the British empire which they have not carefully surveyed and reported ? Is there one of the British dominions where traitors have not been courted or bought ? Is there one inch of coast in the Mediterranean where treasonable correspondence has not been established ? Is there one Asiatic power not tempted by promises, flatteries, bribes, and vaunts, to

become, though but secretly, the enemy of England ?

These, too, are not the acts of petty and obscure and unnoticed agents alone ; of men whose base and sordid station in society might excuse, if any thing could, their wanton and foul disregard, not merely of the political duties, but even the personal decencies of feeling and gratitude. It is not only such men as these :—high names and dignitaries of the Russian empire, distinguished noblemen and veteran warriors ; counts, princes, generals, admirals, public functionaries, or retired from service ;—some of them, too, greeted by Britain with confidence or rewarded with grateful favours ill deserved, have carried on for years this series of machinations ; not unknown or unaided, at least by individuals, in the Russian embassies of London, Paris and Vienna.

What can England, what can Europe, what can the world say or think of conduct so flagitious and faithless as this ? Is dishonour inherent in a whole nation so entirely, that the very men whom its sovereign selects and relies upon to uphold its faith with a foreign power should be the voluntary agents of treachery, abetting treasons and wars in the very countries where they themselves are received on the faith of character ? Will the envy of some millions of trade, the jealousy of strong fortresses and fleets, and the hatred of a proud reputation for arts, arms, and independence, crawl through the filth of infamy to strike the assassin blow ? But if England could be undermined and robbed of her station, on whom would the mantle of her glory descend ? Could it fall upon a race that has thus steeped itself in baseness, and branded the characters of indelible shame on its own front ? Could the glory of Britain descend with her power to blazon ignominy or consolidate usurpation ! Are not national faith and honour the sole basis of stability—the heart's blood that flows through the limbs, regulating their health, and confirming their existence ; while dishonour is the first stage of decay ?

The policy of the Emperor himself, is, as we have stated in the article already referred to, far less grasping than that of his predecessors, though far also in itself from being destitute of ambition. But it is the ambition of preservation more than acquisition ; that of consolidating his power at home, and establishing it firmly in countries obtained through whatever means by his predecessors, and which he regards simply in the light of inheritance. There is no artifice or concealment on this point with him. On the contrary, it is carried to a length that often

defies opinion in its undisguised and imperious vehemence. Nor is this a passing ebullition. So strong, indeed, is the feeling of the Emperor on these matters, that there is nothing he would not risk to uphold his actual position on every the slightest point, even against the opinion of his court and ministers. Whilst appeals to his clemency and better feelings are promptly met and responded to in the kindest spirit, whether from subjects or strangers, and acts of generosity are freely elicited on these occasions; the appearance of any thing like pertinacious opposition, though in favour of the best rights, in any portion of his established dominion, goads him to fury, not merely political but personal. Could Poland, for instance, consent to forget her claim to the rank of a nation, her gallant though exaggerated spirit of independence, and her high renown; could she sink down into the condition of a peaceful province of Russia, her individual interests would meet with an even paternal care; but Nicholas has no room in his heart, nor sympathy, for the struggles of bondmen burning to be free.

The antagonism of the Emperor and ministry is consequently two-fold; for whereas, as in the case of Poland, the views of the sovereign are determined towards peremptory and unyielding despotism, some amongst his ministers are in favour of a far milder system. And as hopes and intimations of this nature have been repeatedly held out to the least vehement of the Polish patriots, many of them men of undoubted integrity and real patriotism, a belief in these hopes and a desire to repress the wilder and more hopeless outbreaks of impatient subjugation, have procured for these milder counsellors, though most undeservedly, the name of traitors from their more ardent countrymen.

On the other hand, the Emperor is far from coinciding with the restless system of foreign intrigue carried on constantly and openly, and in despite of him, by the ministry and their agents, with the aid of their friends of the acquisition party. And as all place, power, and influence is in the hands of these; as the system itself is in fact thoroughly Russian, changes of place and person have never done any thing more than altering, at most, the mere means of proceeding. Thus the outworks of other states are sapped, and the foundations, as far as possible, undermined; intrigue is systematized, and corruption introduced every where; foreign powers are irritated, soothed, and countervented, until they take the alarm; the Emperor, when appealed to, or made aware of it, peremptorily discourages and openly disavows the course, of all but the outlines of which he is kept in ignorance by the min-

istry of the department, until too late; and he is at times borne along with the stream, even in defiance of his own peremptory commands at the outset. The system assuredly is not that of the government, but it assuredly is that of the whole Russian nation.

With a full understanding of these points, on which we have dwelt at considerable length, as the true basis of the system which eats like a cancer into the very frame of political society, we shall be enabled to comprehend the real position of foreign states with regard to Russia; where the aristocracy, eager for an oligarchical rule, and connected with the ministry on one hand, and the army on the other, bear along with them the sovereign, more or less easily, but in despite of his personal character, feelings, and wishes.

The intrigues in the East, which are certainly in contradiction to the individual views of the Emperor, were then in any thing like their extent probably unknown to him, and to him alone, in the whole empire. The powers which would have been requisite to sustain them effectually could not be obtained without his consent; this appears to have been withheld; and the intrigues themselves, though carried on with the full concurrence of the ministers and the nobles, whose course is more hidden, though unchanged from that of former times, failed and fell away at the first breath of approaching contact.

Such is the clue to the recent explicit disavowal made by the Emperor Nicholas of the acts of his ministry, in answer to the spirited requisition of the British Foreign Minister; and this likewise explains the previous declaration of Lord Palmerston in parliament, that there were governments that attempted every thing and disavowed every thing. The Emperor can but work with the means in his power; and from the general bias of the nation it must be confessed that if aggrandisement is no longer the principle of Russian policy, it is still its tendency.

In the question before us, too, one very material consideration appears to have been kept nearly out of sight; namely, the relations of Persia. In judging of the conduct of a power it is not enough to know that its own course has been prosperous at the expense of its neighbours, without also knowing how far these may have provoked the quarrel, and what is their general character.

Various statements as to the progress of the Russian dominion in the east have appeared before the public, and we select the following particulars as offering a clear outline of the proceedings; purposely rejecting such as bear, or seem to bear, a decided partizan character in narrating the transactions.

We begin with the earliest period of Rus-

sian encroachments, when the exertions made by Peter the Great to extend the commerce and influence of Russia in the East, brought that power into immediate contact with Persia. In pursuance of his scheme to open a trade with India, he sought every opportunity to mix in the affairs of the intervening nations. In 1717, Prince Bekevich was sent on an embassy to Khiva, and directed to seize the gold mines which were supposed to be in that country; he was provided with a military force. This expedition completely failed, and the Prince and his men were cut to pieces.

In 1719, the descent of a body of Lesghees from the Caucasus on the Province of Shirvan, where they put to death all the merchants, amongst whom were 300 Russians; the inability of Sooltan Hoossein (besieged in his capital by the Affghans), to punish the offenders; and his repeated embassies sent to the court of Persia to implore the aid of Russia,—afforded Peter an opportunity to establish himself in the countries lying to the south of the Caucasus.

In 1722, he sent an army, ostensibly for the purpose of punishing the Lesghees, and entered the Persian territories, with professions of entire friendship for the Shah. In August of the same year, he took possession of the fortress of Derbend, the gate of the Persian provinces on the Caspian sea, and besieged Badkoo. He induced the Persian Envoy in his camp to sign a treaty, by which Persia ceded to Russia the provinces of Gilan, Mazanderan, and Astrabad, with the town of Shamakhoo, as soon as it should be recovered from the Turks. On his return to Astrachan in the same year, he sent troops to occupy Gilan and ordered the siege of Badkoo to be prosecuted. The fall of this place, and the cessions made to him by the treaty of Ismael Beg, gave to Russia the whole coast of the Caspian, which belonged to Persia, and which it was an object of Peter's ambition to possess. Shah Tamasp, however, refused to ratify the treaty, and sent a force against the Russians, which, at least, prevented them from pursuing their advantages.

In 1727, Catherine the First concluded a treaty with the Porte at Constantinople, which fixed the boundaries of Russia, Turkey, and Persia, with the greatest precision, and gave to Russia all that had been ceded to her by the unratified treaty of Peter. In a few years afterwards, however, Mazanderan and Astrabad were restored to Persia, by a treaty concluded at Resht in Gilan.

This treaty was renewed in 1735, with Nadir Shah, who cultivated, by every means in his power, a good understanding with

Russia, while engaged in expelling the Turks from their conquests in Persia.

Georgia, with other provinces south of the Caucasus, not in possession of Russia, had for a series of years been dependent on the crown of Persia; but the Wallee (as the Prince of Georgia was styled) and the other chiefs, availed themselves of the opportunities offered by the dissensions which weakened the empire of the Shahs, to rejoice in a temporary independence.

In the reign of the last Princes of the Suffoveeah dynasty, the northern and western parts of Persia had been overrun by the Turks as far as Hamadan and Ardebil; and the Wallees of Georgia, with the chiefs of the neighbouring provinces, had submitted to the Ottoman Porte. Nadir Shah, by a succession of victories, drove the Turks from all the ancient northern possessions of the Suffoveeah Kings, in which were included Georgia, Imeretia, Mingrelia, Shirvan, Shekkee, Ganja, and Erivan. The places belonging to Persia, on the shores of the Caspian, so treacherously seized by the Czar, were recovered; and all her original dependencies on the side of the Caucasus once more acknowledged the authority of Persia. The ancient family of the Wallees of Georgia was raised to the dependent throne of that country, and Nadir, by dividing it into two kingdoms, weakened the power of its princes, and was enabled to reward the services of Heraclius, who had accompanied him to India, with one of the crowns. The other was given to his father, Tamaras, the representative of the family.

After the death of Nadir Shah, the kings of Georgia, harassed by continued attacks from the mountaineers, whom they were unable to control, made a simultaneous application to Russia for assistance, which was granted. This, about 1752, may be considered the first step towards the separation of Georgia from Persia; Russia from this time pressed with persevering activity her intercourse with these Persian dependencies.

About eight years after this occurrence, Heraclius drove his father Tamaras from his kingdom, and united it to his own. In 1768, he was called upon by Russia to co-operate with General Todlevin, who invaded Turkey from Imeretia, and whom the Wallee joined. But he had not yet openly cast off his allegiance to Persia, nor had any formal engagements been contracted between him and the Russian government. Russia had, however, manifested her readiness to connect herself with Georgia; and the Princes of that country took advantage of the troubles which engaged Kerreem Khan, to prepare a safe renunciation of their connection with

Persia by more intimate intercourse with the Court of St. Petersburg.

In 1781, a treaty with the Oss, or Ossetians, a pagan tribe of the Caucasus, who commanded the defiles leading into Georgia, opened to Russia the passes to that country; and two years afterwards a treaty was concluded at Georgiefsk, between the Wallee and the Empress Catherine II., by which the former recognised the paramount sovereignty of Russia, for himself and his heirs; and the latter engaged to afford protection not only to the Wallee's present possessions, but to any he might hereafter acquire, and to guarantee the kingdom to his heirs for ever.

In 1785, General Potemkin carried to Teflis the ratification of this treaty, and constructed a causeway across the Caucasus. A pension of 60,000 silver roubles annually was granted to the King of Khartlee (the Wallee of Georgia), to maintain an army, and to defray such expenses as he should be called upon to make by the Russian commandant.

Georgia had, therefore, become a dependency of Russia, and had been received by that power under its protection, without any regard to the allegiance due by the Wallees to the sovereigns of Persia. Field-marshal Prince Potemkin and General Goodovich received unlimited authority to accept the submission of any nations that may desire to become subject to Russia; and the latter was informed, that the Khans of Badkoo and Derbend might be admitted vassals of the empress. Both these places were dependencies of Persia.

After the death of Kerreem Khan, 1779, it was not until Aga Mahommed Khan triumphed over all his antagonists, and cut off the last hopes of the royal family of the Zunds, that he found leisure to turn his attention to Georgia, and punish the revolt.

In 1795, he assembled a considerable army at Teheran, defeated Heraclius near Teflis, and entering that city before General Goodovich, who commanded the Russian troops of the Caucasus, could arrive to oppose him, committed horrible excesses.

The Empress Catharine II., shocked and irritated by the vengeance which had fallen on Georgia in consequence of its having transferred its allegiance to Russia, immediately declared war against Persia; in the following year, Count Zuboff marched upon Derbend early in the summer—took that fortress, and received the submission of Badkoo, Coobba, and Shirvan; wintered in Moghan, and had taken Anzelee, Lankeran, Ganja, and Saree, when Paul ascended the throne, and recalled the army.

Aga Mahommed Khan was at this time employed in Khorassan, and on hearing of Zuboff's successes, hastily returned to oppose him; not in the field, he openly declared, but by cutting off his supplies, harassing and obstructing his movements. The plan was sagaciously laid, but before he could reach the scene of action, the Russians had already abandoned almost all their conquests. He had only been a few days at Sheesha, when he was murdered by some of his menial domestics whom he had threatened to put to death; and the late Shah, who succeeded him (1798), was too much occupied in establishing his authority to be able to pursue the bold policy of his predecessor.

In the same year, 1798, Heraclius died, in the eighty-fourth year of his age and fifty-second of his reign, and left his crown to his son, Georgeen Khan, or the Wolf, a cruel and brutal prince.

In the year 1800 the Emperor Paul incorporated Georgia with the Russian empire, and in the year following Georgeen died, and Paul was put to death. The Emperor Alexander on his accession confirmed his act, and in 1803 sent General Zizianov as governor and commander-in-chief into Georgia. In the same year Mingrelia submitted. In 1804 Zizianov took Ganja, and having been invited by Mahommed Khan Kajar, then governor of Erivan, to advance on that place under a promise that it should be delivered up, proceeded as far as the Three Churches, when he encountered the Persian army advancing. This was the first action in which the Russian and Persian armies had come in contact in a general action. The Persians were defeated. Zizianov then invested Erivan, which Mahommed Khan refused to surrender; but the Russian general was obliged to raise the siege from want of provisions, the desultory attacks of the Persians, and the sickness of his troops.

In 1805 Karabaugh voluntarily submitted to Russia.

The war was continued with various success till the year 1814, but Russia added little to her territorial acquisitions after the death of her first governor.

Such is the first portion of the outline we lay before our readers, and must pause to observe that the Georgians themselves, always in revolt against Persia, always assigned the dreadful tyranny they suffered under from her as the reason of their abhorrence of this power. We need not go into details; but from and including the time of Shah Abbas the Great there has been no question of this fact amongst his-

torians, with the single exception of Kerreem's reign ; and the incorporation of Georgia with Russia was avowedly in consequence of the expressed wishes of the former.

When we refer to the instances of horrible cruelty of which the immediate successors of Kerreem were guilty at home,* we can scarcely wonder that the more distant provinces of the empire, through the tyranny and avarice of subordinate agents, were in a far worse state, and anxious for any change of condition and allegiance. This fact will serve as a clue to much that is otherwise unexplained.

* To instance this, and show the insecurity of life and property we begin with the greatest of Persian sovereigns.

"When Abbas the Great was hunting in this valley, he met one morning, as the day dawned, an uncommonly ugly man, at the sight of whom his horse started. Being nearly dismounted, and deeming it a bad omen, he called out in a rage to have his head struck off.

"Your crime, said the king, is your unlucky countenance, which is the first object I saw this morning, and which had nearly caused me to fall from my horse. Alas ! said the man, by this reckoning, what term must I apply to your majesty's countenance, which was the first object my eyes met this morning, and which is to cause my death ? The king smiled at the wit of the reply, ordered the man to be released, and gave him a present, instead of taking off his head."—*Malcolm's Anecdotes of Persia*.

Of Aga Mahommed Khan more particularly we enumerate a few cruelties.

"Mustapha Kauli Khan, his brother, he deprived of sight ; and he inveigled the brave Jaffier Kauli Khan, another brother, by protestations of affection, and oaths of safety, to come only for one night to Tehran. But that night was fatal ; the unsuspecting guest was despatched by assassins posted in a new palace, which he had gone to visit at the tyrant's desire. Yet with a mockery of piety or timidity of superstition, which it is hard to comprehend, he kept with the dead the oath he had violated to the living, by removing the corpse that very night beyond the city walls."—*Fraser's Hist. of Persia*.

"We cannot relate the brutal indignities, torments, and mutilations, which the victor inflicted upon his captive (rival), before death, in the year 1795, released him from his misery. Still less shall we dwell on the atrocities committed in the city of Kerman in revenge for the assistance rendered by its inhabitants to their legitimate prince. The place was depopulated ; all the full-grown males were murdered or deprived of sight, and turned out to wander in helpless blindness. A horrid tribute of human eyes, amounting to a certain number of mauns, was exacted ; and the women and children given as slaves to the soldiers."—*Ibid*.

The following act of meanness is ludicrous :

"Riding out with some courtiers, a mendicant met the party, to whom the king, apparently struck with his distress, ordered large alms to be given. The example was of course followed by all, and the beggar obtained a very considerable sum. That night the sovereign's impatience betrayed his secret : 'I have been cheated,' said he to his minister : 'that scoundrel of a mendi-

We now proceed to notice that the first connection of England with Persia may be said to have commenced with the mission of Sir John Malcolm to Tehran in 1800 ; and the first fruits of the alliance were the commercial and political treaties concluded by him in 1801. The latter engaged Persia to attack the Affghans, who then threatened our possessions in India, and to exclude the French from the Gulf of Persia.

In 1805 the Shah, finding himself unable to cope with Russia, addressed a letter to Napoleon, requesting his assistance, and desiring to form an alliance. So little was at that time known of Persia in Europe, that the

cant whom you saw this morning, not only promised to return my own money, but to give me half of what he should receive through its means from others.' Horsemen were instantly ordered in pursuit ; but the fellow took care not to be caught."—*Ibid*.

He seems always to have acted on this maxim, suppressing violence only for the sake of interest, and selling immunity to the worst criminals under sentence, to fill his own coffers.

Sir John Malcolm gives us the reason for the long prosperity of that able minister, Meerza Buzurg, as explained by himself.

"I never," said he, "accumulate money or property ; I have a small inheritance in land, which has been in my family for centuries ; this cannot, in accordance with usage, be confiscated ; and as to everything else I spend it as I get it. This principle is known ; and the king," he added, "often laughs, and says, 'I should not gain one piastre by the death and plunder of that extravagant fellow Meerza Buzurg.'"—*Malcolm*, v. i. p. 188.

And this was even in the moderate reign of the late Shah. Haji Ibrahim, too, the minister to whom he owed his crown, was blinded on suspicions, false as they afterwards proved.

Of Persian faith we give the following anecdote :

"The Persian ministers and governors are in the habit of using particular seals, which nullify the contents of their letters ; they also use oaths in affirmation, which they consider they may safely break. Old Shaik Nessr, at Bushire, was accustomed to swear by the head of his father—generally considered one of the most sacred and inviolable oaths that can be offered. Now his father happened to have been a Sunni, and he was convinced there was not the least harm in heaping perjury by wholesale on his soul, which he believed was in hell already, and therefore could not be made worse. A great many years ago I had some business of consequence to transact with him, and he kept pouring out oath after oath by the head of his father. I asked him to swear by his own, and he refused, saying he thought it very wicked to do so. Not long after, in the course of the same business, he made use of his own head for an oath, wishing to secure my credence. I said coolly, now I trust you, Shaik. It is of the utmost consequence, therefore, in transacting business with the Persian ministers, to know what the seals and what the oaths they use are exactly worth. I was lucky enough to be taught these secrets of Meerza Sheffee, and the Ameen ed dowlah, by my good friend Meerza Buzurg."—*Letter of Sir H. Jones*.

court of Paris were even ignorant whether the person who had addressed those letters was really entitled to the rank he assumed, and M. Jaubert was sent to Tehran to ascertain the condition of the country.

On the return of M. Jaubert in 1806, Meerza Reza was sent by the Persian government on an embassy to Napoleon, whom he accompanied to Tilsit, and with whom he concluded a treaty, ratified by the emperor in May, 1807.

In the same year Mahommed Nebbee Khan was sent on a mission to the British Government in India to claim assistance against Russia; this mission was unsuccessful, and Persia, losing all hope of support from her old ally, had no alternative but to throw herself into the arms of France.

The possessions of Great Britain in India had become so important, that it was believed her power in Europe might be affected by an attack on her eastern dominions; and Napoleon, therefore, turning his attention to Asia, gladly seized the opportunity which was afforded him to establish a connection with Persia, which he justly considered a necessary preparatory step to his projected invasion of India. General Gardanne was charged with a mission to the court of the Shah; and the failure of the application which had been made to India for assistance, the readiness with which the French had entered on the alliance, and the promises which were made by the French ambassador, combined to secure to him a distinguished reception.

But the success which attended the mission of Gardanne forced the British government, here and in India, to take measures to counteract the views of France. Simultaneous missions, of great splendour, were sent to the court of Persia from England and India; no expense was spared, and no exertion considered too great to secure her alliance. The favourable reception of the mission of Sir Harford Jones in 1808, and the consequent expulsion of the French agents, laid the foundation of an alliance between the crowns of Great Britain and Persia, which was confirmed by a preliminary treaty in 1809.

We give a portion of this--

"Art. 3. His Majesty the King of Persia judges it necessary to declare that from the date of these preliminary articles every treaty or agreement he may have made with any one of the powers of Europe becomes null and void; and that he will not permit any European force whatever to pass through Persia, either towards India or towards the ports of that country.

"Art. 4. In case any European forces have invaded, or shall invade the territories of his

Majesty the King of Persia, his Britannic Majesty will afford to his Majesty the King of Persia a force, or in lieu of it a subsidy with warlike ammunition, such as guns, muskets, &c., and officers to the amount that may be to the advantage of both parties for the expulsion of the force so invading; and the number of these forces, or the amount of the subsidy, ammunition, &c., shall be hereafter regulated in the definitive treaty. In case his Majesty the King of England should make peace with such European power, his Britannic Majesty shall use his utmost endeavours to negotiate and procure a peace between his Persian Majesty and such power. But if, which God forbid, his Britannic Majesty's efforts for this purpose should fail of success, then the forces or subsidy, according to the amount mentioned in the definitive treaty, shall still continue in the service of the King of Persia as long as the said European force shall remain in the territories of his Persian Majesty, or until peace is concluded between his Persian Majesty and the said European power. And it is further agreed, that in case the dominions of his Britannic Majesty in India are attacked or invaded by the Affghans or any other power, his Majesty the King of Persia shall afford a force for the protection of the said dominions, according to the stipulations contained in the definitive treaty.

"Art. 5. If a detachment of British troops has arrived from India in the gulf of Persia, and by the consent of his Persian Majesty landed on the island of Karrack, or at any of the Persian ports, they shall not in any manner possess themselves of such places; and from the date of these preliminary articles the said detachment shall be at the disposal of his Majesty the King of Persia, except his Excellency the Governor General of India judges such detachment necessary for the defence of India; in which case they shall be returned to India, and a subsidy in lieu of the personal services of these troops shall be settled in the definitive treaty.

"Art. 6. But if the said troops remain by the desire of his Majesty the King of Persia, either at Karrack or any other port in the gulf of Persia, they shall be treated by the governor there in the most friendly manner; and orders shall be given to all the governors of Farsistan that whatever quantity of provisions, &c. may be necessary shall, on being paid for, be furnished to the said troops at the fair prices of the day.

"Art. 7. In case war takes place between his Persian Majesty and the Affghans, his Majesty the King of Great Britain shall not take any part therein, unless it be at the desire of both parties, to afford his mediation for peace.

"Art. 8. It is acknowledged that the intent and meaning of these preliminary articles are defensive. And it is likewise agreed that as long as these preliminary articles remain in force his Majesty the King of Persia shall not enter into any engagements inimical to his Britannic Ma-

jesty, or pregnant with injury or disadvantage to the British territories in India."

At that time there were two objects of importance to be effected at the court of Tehran,—the abrogation and dissolution of the alliance newly formed between France and Persia—and the prevention of further encroachments by Russia on the territories of Persia: both these objects were accomplished by offering Persia a subsidy, for which, however, the British minister had neither instructions nor authority.

In taking, therefore, this responsibility on himself he felt it his duty to word the terms of the subsidy as indefinitely as possible: nevertheless there was a secret understanding between the plenipotentiaries on both sides, that the subsidy should not exceed 160,000 tomans, or about 128,000*l.*; and this, as to the form and shape in which it was to be given or afforded, was left to the British government.*

In 1811, Sir Harford Jones returned to England, and the Persian ambassador, who had been sent to London with the ratification of the preliminary treaty, returned to Persia, accompanied by Sir Gore Ouseley in quality of ambassador extraordinary from the King of England. The subsidy payable to Persia, which had been fixed by Sir H. Jones on a smaller scale, was raised to 200,000 tomans annually. A definitive treaty was concluded on the basis of the preliminary engagements entered into by Sir H. Jones, and immense presents were lavished on the Shah and his courtiers, to keep alive the friendly feeling which had been excited.

In 1813, by the mediation of the British ambassador, a treaty of peace was concluded at Goolistan, by which Persia yielded to Russia all her acquisitions south of the Caucasus, and engaged to maintain no navy in the Caspian; while Russia became bound to aid the heir to the crown of Persia against all competitors. The terms of this treaty were extremely indefinite.

Sir Gore Ouseley returned home in 1814, leaving Mr. Morier in quality of minister plenipotentiary at the Persian court; and in the same year Mr. Ellis was sent on a special mission to modify the definitive treaty concluded by Sir Gore. Great Britain was by this document bound to pay to Persia a subsidy of 200,000 tomans annually: to maintain troops in the event of her being attacked by any power at war with England; and should she be attacked by any

nation at peace with England, we engaged to use our mediation towards an amicable adjustment of their differences; should it fail, to pay the subsidy. Persia, on her side, engaged to obstruct any power seeking to pass through her country for the purpose of invading India. The treaty is exclusively defensive, as declared in the document.

Hitherto England and Russia had not come in contact at the court of Persia; but at the time of concluding the treaty of Goolistan, a hope had been held out, that through the good offices of England some of the countries ceded by the Shah might be restored by the emperor. An embassy was therefore sent to St. Petersburg with the ratified treaty, and with instructions to press the Russian government to admit the good offices of England, and to fulfil the hopes raised by the Russian plenipotentiary and the British ambassador.

The good offices of Lord Cathcart and the solicitations of the Persian embassy were unable to procure from the emperor the retrocession of one foot of ground, but they obtained a promise that General Yermoloff, ambassador to Persia and governor-general of Georgia, would discuss the matter with the Persian ministers at Tehran.—When General Yermoloff came, he would restore nothing; and thus all the acquisitions of Russia were permanently confirmed. An insidious proposition made by Russia to supply officers to discipline the Persian army, was rejected, and the *chargé-d'affaires*, whom the general left in Persia, was directed by the Shah to station himself at the court of Abbas Meerza. In the meantime our minister plenipotentiary had been recalled, and Mr. Willock, British *chargé-d'affaires*, was left to maintain the interests of his government; in opposition to the splendid mission of Russia backed by all the weight of the chief authority in Georgia and an army of 40,000 men.

Under these circumstances, it was obvious that Persia was not likely again to seek a war with a power, who, under the most unfavourable circumstances, had been able to seize and keep possession of her most fertile and valuable provinces; and also, that though we might have something to fear from her too ready and obsequious acquiescence in the views of Russia, there was nothing to dread from her desire to renew a contest in which she had already suffered so severely.

Russia seems to have adopted this opinion, and to have made it her policy to push herself by imperceptible advances into the exercise of an habitual influence over the councils of the prince royal. But the treaty

* A Letter on the Present State of British Interests and Affairs in Persia, addressed to the Most Noble Richard Marquis Wellesley, K. G., &c. &c. by Harford Jones Brydges.

of Goolistan had not defined the line of frontier so distinctly as to leave no room for cavil and dispute, and the appointment of commissioners to effect the final demarcation was delayed on various pretexts.—When commissioners, therefore, were at length appointed, numberless disputes arose; and these gave rise to angry discussions, conducted on the one side with the bitterness of wounded pride, and, on the other, with the insolence of conscious power. Various lines of frontier were successively proposed by one party, and rejected by the other. Commissioners met and parted, without having advanced one step; agents were sent by the prince royal to Teflis, and instructions transmitted to the Russian chargé-d'affaires at Tabreez, without any progress being made towards the accomplishment of this object.

At length all appeared arranged, and a proposal made by the Russian chargé-d'affaires was accepted by the prince royal, who was charged with the affairs of the frontier. But the Russian agent had exceeded his instructions, and General Yermoloff refused to ratify the engagements which M. Mozarovitch had contracted. Once again a formal engagement was entered into by an agent of the prince royal at Teflis; but this the Shah refused to sanction.

In the summer of 1825, M. Mozarovitch came to the Shah's camp, for the purpose of endeavouring to obtain his majesty's ratification of the terms agreed upon between Futteeh Allee Khan and General Yermoloff at Teflis; but his majesty distinctly refused his consent to the arrangement. In the autumn of the same year M. Mozarovitch left Persia; and the government of Georgia, acting on what they called the treaty of Futteeh Allee Khan, though unratified, occupied with a military force the lands which would have become theirs had this treaty taken effect.

One of these portions of land was an uninhabited stripe called Gokchah, which borders on the lake of Gokchah or Sevan. To the remonstrance of the prince royal against the military occupation of this part of the Persian territory, General Yermoloff had replied, by admitting the justice of the prince's remarks, and concluded by offering to withdraw the detachment. Yet, after all this, Russia, on the strength of an unratified engagement, concluded by the agent of a deputed authority, took permanent possession of this ground and retains it. As soon as the occupation of Gokchah was known to the court of Tehran, an envoy was sent to Teflis to remonstrate, and to propose that the Russian detachment should

be withdrawn until time should be given for an appeal to the emperor. But this was refused; and in answer to the letters which the Shah had written to the governor-general of Georgia, he was informed that Gokchah would be given up by Russia if the lands of Kapan were immediately evacuated.

Kapan had been, from the conclusion of the peace, in possession of Persia; but within a few years a claim had been set up by Russia, and it remained one of those points upon which it would have been the duty of commissioners to decide. The claims of Persia were, at least, as well supported as those of Russia; and some of the Russian official maps had marked Kapan as belonging to Persia. It was, therefore, an obvious injustice to seize an undisputed possession of Persia, and demand, as the price of its evacuation, the abandonment of claims, probably just, to another portion of territory.

At this time (Dec. 1825) the death of the Emperor Alexander was announced, and the discussions suspended; but as soon as the power of Nicholas was established, Persia prepared to send an embassy to St. Petersburg, to congratulate the new emperor on his succession, and to conclude with him the definitive settlement of the frontier. Before arrangements could be made, it was announced that Prince Menzikoff was on his way to remove the causes of difference between the governments of Persia and Georgia.

The court of Tehran had begun to believe that Russia was firm in her purpose to act with a total disregard to justice. All recent representations had been treated with neglect, or replied to in an arrogant and insulting tone by the Government of Georgia. Opprobrious terms had been applied to the prince royal, in letters to his servants, and every thing seemed to indicate a determination on the part of General Yermoloff to drive Persia to extremity. At the same time it was whispered that the tranquillity of the Russian empire had been disturbed, that a civil war was carried on in St. Petersburg, and that the tribes of the Caucasus were already in arms to assert their independence.

It was known that the misrule of the Russian authorities in Georgia, and their wanton interference with the religious prejudices of their Mahomedan subjects, had produced a feeling of serious discontent. Proposals had even been made to Persia by the heads of the tribes and chiefs of districts to co-operate with her in a war against Russia. Letters had been written by the Mahomedan population of all the Russian

provinces bordering on Persia, to the head of their religion, imploring his interference in their behalf; and he had come from the sanctuary of Kerbela, expressly to urge the Shah to take up arms in defence of his insulted religion. The ecclesiastics of Persia joined their leader, and the mosques were filled with persons of all classes, lending a willing ear to the inflammatory orations of their Moollahs, while the Shah was threatened with the curses of the faithful, and even with everlasting perdition, if he failed to take up arms in the holy cause.

In the midst of this ferment, Prince Menzikoff arrived in the royal camp. He was treated with honour, and even with distinction; and a calm and temperate negotiation was opened, with a sincere desire on the part of the Shah to see it terminate in an amicable adjustment of all the matters in dispute. Sanguine hopes were entertained that everything would be satisfactorily arranged; and if there were some who, for private ends, wished to hurry Persia into a war, there were other and the most influential of her councillors who anxiously desired to avoid it. The king himself was of this number; though he had been induced to give a solemn pledge to the Moollahs that if Gokchah was not restored, he would agree to make war upon Russia. But in answer to all the demands for the evacuation of Gokchah, the Russian envoy replied, that he had no instructions regarding it, and was not empowered to agree to its evacuation. It was proposed that it should remain unoccupied by either party, until a reference could be made to the emperor. This he was equally unable to comply with; and he put an end to the discussion by repeating that his instructions extended to nothing beyond some trifling modification of the unratified treaty of Futteeh Allee Khan.

Those who had been clamorous for war now called upon the Shah to redeem his pledge or forfeit his hopes of heaven. The Mahomedans of some of the Russian provinces were already in arms, and even the Christians of at least one of these had made overtures to Persia. The troops had been excited to enthusiasm by the Moollahs, and the war was commenced. Sir H. Jones states:—

“As far as I know, there might have been faults on both sides in causing this affray; but the events of the war were most unhappy for Persia; and to me it appears surprising that our influence with the Shah should in so short a time have fallen so very low, as to render our minister not able to prevail on the Shah to avoid so ill-judged a contest; or even before engaging, not to accept, if it was of-

fered, our mediation to accommodate matters. Such mediation, I conceive, we are fully authorized to offer under a clause of the fourth article of the preliminary treaty of 1809.”—p. 29.

Even after the forces marched to the frontier, had Prince Menzikoff been empowered to evacuate Gokchah, they would still have been countermanded, and the war would not have taken place.

It commenced suddenly, and on the part of the Persians: they massacred all the Russian detachments and garrisons that could be overpowered. The Prince-royal, in July, 1826, took the field with an army of 40,000 men, about 12,000 of whom were regulars, together with a few companies of foot-artillery. The Muscovite troops on the south of the Caucasus were estimated at the same amount, including 6000 Cossacks. The opening of the campaign was favourable to Persia, and Gokchah, Balikloo, and Aberan were recovered.

But the hopes thus awakened were speedily dissipated. On the 14th September, Mahommed Meerza, son of Abbas, sustained a repulse at Shamkora, and, on the 25th of the same month, the prince himself, having rashly engaged Paskewitch in open field near Elizabethpol, was defeated with the loss of 1,200 men. He fled, and his army dispersed after plundering his own camp.

By great exertion another army was collected, with which, however, little was done; and during the winter several ineffectual attempts were made to accommodate matters by British mediation. The war recommenced in the spring; Erivan was invested by General Benkendorff, who, however, raised the siege on the approach of the Shah towards Khoi; but the prince sustained a check before Abbasabad, and the surrender of that town, by treachery, soon followed.

The defeat of 4000 Russian infantry and 2000 cavalry, with twenty field-pieces, at Aberan, in August, 1827, again encouraged the hopes of Abbas; but the advance of Paskewitch, with strong reinforcements and a battering train, put an end to the delusion. Prince Eristov entered Tabreez on the 16th October, and Erivan was taken on the 19th. In January, 1828, the king accepted once more the aid of the British minister at his court to procure peace; which the enemy did not decline. The terms proposed by the latter were humiliating enough; and the ineffectual remonstrances and reluctance of the Shah and his ministers protracted the negotiations until the 21st February, 1828, when a treaty was signed at Turkmanchai.

By the first article the treaty of Goolistan was annulled for a new arrangement. By the third, Persia ceded the Khanats of Erivan and Nakshivan. By the fourth the boundary line was drawn from that of the Ottoman States, passing over the summit of the Lesser Ararat, and down the lower Karasu to the Aras; then proceeding, in the bed of that river, to Abbasabad and Yedibouloob; traversing the plain of Mogan to Adina Bazaar, ascending the current of that name to its source, and thence running along the west of the Elborz Mountains to the source of the Ashtara, which it follows to the sea; thus ceding the greater part of Talish to Russia, and including all such islands of the Caspian as fall within its direction. No ships of war, except Russian, were allowed on the Caspian Sea. The sixth article stipulates for the payment of ten crores (500,000 each) of toman's by Persia, as indemnification for the expenses of the war; and a variety of provisions for commerce, the government of the ceded provinces, and the management of the migratory population, with other precautionary clauses, follow and conclude the treaty.

On this treaty Sir H. Jones very justly observes,

"With a British ambassador on the spot, Persia seems to have been delivered bound hand and foot, to the court of St. Petersburg. There is one clause, which as a commercial and a naval nation, we never ought to have allowed to be extorted from Persia. 'No ships of war except Russian to be allowed on the Caspian Sea.' Our justification for such interference might have been firmly based on the concluding sentence of the eighth article of the preliminary treaty.

"And it is likewise agreed, that as long as these preliminary articles remain in force, his majesty the King of Persia shall not enter into any engagement inimical to his Britannic Majesty, or pregnant with injury or disadvantage to the British territories in India." —p. 52.

The moderation and even the justice of the new Emperor were soon called upon for their display, or else the catastrophe which occurred at Tehran in February, 1829, might have furnished an excuse for further exactions. In that month Mr. Grybyadoff, the Russian envoy at the court of the Shah, and forty-four individuals belonging to his suite, fell victims to the popular phrenzy excited by the treaty, at which the nation was greatly indignant. The Russian party were massacred at the official dwelling. The Shah, equally shocked and alarmed at an outrage he could not prevent, despatched a mission charged with explanations to the court of St. Petersburg, which was gra-

ciously received, the provocation admitted by the Emperor, and harmony has since been preserved.

This has been chiefly owing to the able and moderate management of Prince Dolgorouki in the first instance, who was sent to Persia to arrange for the above mentioned act of violence, and whose conduct entirely changed the Persian feeling favourably for Russia. General Bezac his successor acted, for a short time, as consul, previous to the arrival of Count Simonivitch, the present minister.

We must now turn back to observe that after the conclusion of peace between Persia and Russia by the treaty of Goolistan in 1814, the British Government justly felt that the integrity of the Persian dominions would be best and most effectually secured by the preservation of amicable relations with Russia; since that period, everything which could be viewed in the light of a competition for ascendancy in the councils of the Shah appears to have been avoided. We seem to have come to some tacit understanding with Russia on this subject—to have made it our study to avoid coming in collision with her in Asia, and to prevent, if possible, any subjects of discussion between the governments from being permitted to arise out of the proceedings at the court of Tehran; in short, to have considered Persia as neutral ground.

This was, perhaps, the most obvious policy which could have been pursued; and, so long as it could be preserved, and was faithfully adhered to, by both the courts and by their servants, was perhaps as well calculated as any other to answer our purpose, while it had the obvious advantage of being liberal, fair, and just. But it had also the disadvantage of being most favourable to the party who should observe it with least exactness; and it is, therefore, important to inquire, whether Russia or England is most likely to be led by circumstances, or by the tone of her general policy and the manner in which she conducts her relations with Persia, to press her influence, and attempt an appropriation of the neutral ground, which we have supposed to be considered such by mutual agreement.

We must notice, however, that this policy, the result of necessity, and arising out of the recent events, though perfectly adapted for the time when it was resorted to, by no means necessitated an adherence to it when circumstances were materially altered. It will be observed that the 4th article of the English Treaty in 1809 specified a subsidy to Persia in the case of an invasion. Assuredly Prince Abbas Meerza

relied strongly upon this, and without it would never have engaged in the contest he provoked, we are bound in justice to say, and we say it on good authority, wantonly and in defiance of the feelings of the Persian government and king. But though Persia had fairly executed all her share of the Treaty in question, the English minister when called upon to fulfil this condition, hesitated, hung back, negotiated, and delayed under every possible pretext, while he could not deny the faith or the claim of Persia. It was clear, however, to all the parties that Mr. Canning only sought a means of escaping the fulfilment of the stipulations. He was hard pressed by the reluctance to engaging in a war with Russia, represented as too probable by the minister of that power at the British Court, and by the dexterity of a first-rate female diplomatist, to whom indeed the management of the matter was fairly confided by the Russian Court; and whose influence was fatally effective in this and the Turkish questions. In affecting to adhere simply to the policy of his predecessors, Mr. Canning forgot the immense difference and disgrace of refusing the fulfilment only at the time when, and because, the need was urgent. He could not foresee that Persia must become, if further humbled, the tool of Russia against the East; if he had, no earthly power would have balanced against his duty. He did not even perceive that the crisis to Persia had arrived; and contented himself with a double sacrifice to vanity, in assuming to arbitrate against a sovereign Prince, and hearing his praises resounded by the lips of successful beauty.

The avarice of the Shah, Futteeh Allee, had left the whole burthen of the war upon the shoulders of the Prince and the province of Azerbaijan; the Shah had yet a strong hankering for the subsidy, on the receipt of which he would certainly have entered into the contest; but Mr. Canning decided that the *casus fœderis* was not clearly established. Sir H. Jones is most certainly mistaken in referring this decision to love of money in the British Minister. He had not the free command of it at the time, it is true, but Mr. Canning was above mercenary considerations. Not so the late Shah. Sir Harford informs us,

‘In his difficulty, the Monarch of Persia applied to the late Sir John Macdonald, who proposed to purchase the erasure of those two articles from the treaty which bound England to pay the subsidy. Negotiations for this purpose were opened, which terminated in the Prince receiving 200,000 tomans, and a promise

(*Sponsio*) on the part of the Envoy to represent the case favourably to the home authorities, in the hope of obtaining an additional sum. Remember, the treaty of subsidy between England and Persia was signed by a gentleman with power from the Crown, was ratified by the Crown, was, it is presumed, inserted in the body of the definitive treaty, and was under the authority of the Crown augmented from tomans 160,000 to 200,000. It was virtually annulled by a gentleman only accredited as Envoy from the Governor-General.

“The very attempt to purchase the erasure of the two articles in the treaty of subsidy evinces, that Mr. Canning did not place much confidence in his decision of the *casus fœderis*; for if he could have proved that decision would hold water, there was no occasion to throw away 200,000 tomans; and if he could not prove that, I must be permitted to think the whole transaction was *dishonourable and unjust*.”

We have never heard of a different opinion being entertained by any one not interested in the transaction.

From the time of this sacrifice of our duties and our honour, it cannot be supposed that England has ever retained much influence in the councils of Persia, in spite of the efforts of our Envoys to that power. The fault, then, is our own alone; and it is the narrow policy of money-matters that has induced England to play the game of Russia.

But to return: there can be no question that the general policy of the latter power, from the days of Peter the First, uniformly pointed to the extension of her frontier on the side of Persia, and more particularly to the acquisition of the coast of the Caspian Sea. It is difficult to imagine a stronger or better marked boundary than that which formed the frontier between Russia and Persia. The Black Sea on one hand, and the Caspian on the other, connected by the chain of the Caucasus, seem to have been designed by nature for the limits of some powerful nation against some great power. The views which induced Peter to pass this barrier, and establish himself beyond it, must have had some ultimate object. He, however, restored it to Persia.

Catherine long after took Georgia under her protection, and directed Potemkin to receive the submission of any nation which might be inclined to offer it. General Goo-dovich was instructed to receive the allegiance of two Persian towns; Zuboff was sent into Persia to seize the provinces adjacent to Georgia, as a retaliation for the attack on Teflis; and Russia became bound to protect not only the present possessions of the Wallee, but also any he might here-

after acquire. This was but pursuing the policy of Peter, and following the same views, without the same due sense of its extravagance correcting the ambition.

When General Yermoloff proposed to supply Russian officers to discipline the Persian troops at the cost of his government,—when missions were subsequently sent to Khiva and to Bokhara, and when Persia was bound to maintain no navy on the Caspian, which amounted to a total abandonment of that sea to the power of Russia,—it was but a steady pursuit of the same purpose.

But at a more recent period, Russia pressed with warmth the establishment of a commercial agent at Resht in Gilan, a province notoriously ill-affected to Persia, and General Yermoloff pushed the Russian troops beyond the line of frontier defined by the treaty; but the cabinet of St. Petersburg, having now altered its views of aggression, sent to its governor in Georgia repeated and positive instructions to conciliate Persia, and to make no exertion to obtain a paramount influence in her councils, or to press her to a rupture with Russia. It is plain that these orders have been ill attended to, and we lose the security which we should otherwise have derived from a confidence in the moderation of the Russian government through the ambitious zeal of its agents.

England, on the other hand, comes in no way in collision with Persia. Her trade with that country is established on well-defined grounds of reciprocal advantage. Her political connection with Persia is confined to watching over her interests, and aiding her in her difficulties. She has no frontier to cause dissensions, and no objects opposed to the interests of Persia to pursue. But there is a strong and urgent demand upon her to maintain the integrity of Persia, as the best security she can have for the tranquillity of her Indian empire,—and every attempt which Russia may make to trench upon the power of Persia, must be considered a step towards bringing her in collision with England in Asia, and towards loosening our hold on our Eastern possessions.

The question then is, How far has Persia been trenched upon by Russia? and, How does the Russian influence there endanger the possessions of England? It must be obvious that the second point can only be answered with direct reference to the first; i. e. by answering this: and that a wide distinction is to be made in the senses of the first. A large portion of Persia has been torn from her rule, and united to the Russian dominion. There are many different narratives of Russian progress in the East;

and in proportion to the lawlessness they charge upon the conduct of that power, follows the conviction that it must be felt and resented, though not revenged, by the suffering party. Nations, as a late eminent statesman well observed, have no political gratitude; but they certainly have a political resentment; and anything that tends to render their power less great or imposing, would wash out all other recollections. If such is the principle of nature, and we suppose this cannot be questioned, it must be the case in Persia. The Persians of the north care little, generally, for the English beyond any advantages reaped from the English trade: the reason is that they know little of them otherwise, and have nothing to fear from them. But they do know the Russians, for they have been conquered by them, and fear them. No one loves what he fears. It is unquestionable that Russia is not popular in the north and north-west of Persia; and a proof of it is, that her trade there is lessening, while that of Britain is increasing at its expense. It having been discovered in those provinces that the Russian goods are scarcely cheaper than the English, and not so durable.

If, then, Russia trenches upon Persian power by privation, her influence is lessened by the act, and her trade suffers, and has suffered, diminution. The only other sense of the term is that of swaying Persia, and this again must be divided into two points; the Nation and the King. We have shown that the former are not, and cannot be, favourable in the north, or they would not reject the trade for that of England. It is clear also that the sea-coast, to which Russia has little nominal access even, is decidedly favourable to the English; for Farsistan and the other provinces repeatedly demanded their succour against the king, and were in insurrection, before the English expedition proceeded to Karrack.

But the power and influence of Russia are great with the court. With a part of it they undoubtedly are, and this the portion attached to the present king, with whom they are all-powerful. But admitting to the utmost that for their own sake alone they persuaded that weak prince to undertake the expedition to Herat, and this we utterly deny; (see Number xliii, Article, *Russian position and policy*;) independent of the gallant resistance opposed by the fierce, abhorrent scorn of the Affghans for the Persians, which no one will doubt; even with a population of not less than 12,000 of the latter nation resident in Cabul, what did the assailing hosts effect? That the talents of Lieutenant Pottinger so aided the defence,

is only admitting the worthlessness of the besiegers : and these men themselves were starving—limited to the scantiest supplies, without pay for days together, and always without arrears. The finance department is worthless there also. But what, more than all these causes, produced the failure, and even these drawbacks on the possibility of success ? The king found that his nobles, both in the camp and at home, were decidedly against the war, and, had it been prosecuted, would have flown into open rebellion in the latter, as they were in actual insubordination in the former.

The north-east of Persia, where, and where alone, the Russians from the Central-Asiatic trade were favoured by the inhabitants, is now left to judge, as so barbarous a race must judge, of the power of Russia by the failure of her reputed schemes : now, every writer and traveller in the East knows success to be there, as indeed everywhere, the chief measure of merit.

Of the king we shall speak presently ; but must observe that the power of Persia has been greatly overrated, as Mr. Frazer, no incompetent witness, so justly observes. Without roads, often without rivers, but amply supplied with mountainous defiles and barren wastes, the true strength of Persia consists in her formidable irregular cavalry, and her chief treasures may probably turn out to be her mines. Some provinces are fertile, but generally, we might almost say universally, communications are difficult throughout the country ; and hence with a variety of conflicting interests, and no one real bond of union, Persia has constantly found ample work for her own sovereign, and never been retainable by an invader. Her peasantry, too, are happy, much more so than that of Poland or Russia ; therefore not so easily persuaded to turn marauders. It is then only when the Russian finances shall be flourishing, and the Persian, an even more hopeless case, tolerably supplied and tolerably managed—and this is a very bold hypothesis—that a combined army of Persian horse and Russian foot and regular cavalry, can make any impression upon neighbouring countries and territories.

Persia, as we anticipated in our last view of the subject, has really solicited the Russian emperor's intervention : and we have reason to believe that M. Franchini's mission has for its principal object the internal pacification of Persia ; as well as the intention to hold her as a counterpoise to Turkey and a check upon her movements : such being the condition of the assistance to be now afforded.

Thus then the influence of Russia may

be great for a time, and with the prince ; but it cannot be lasting with the people. If Russia, as we have stated, as facts show, and she herself well knows, is disliked and feared in Persia, what formidable danger is to be expected from her influence ? She who has confessed to the Shah that she has no money to support his claim to the throne ; and whose offer of a military force for this object was declined, by preference for English aid, on the part of the Persians themselves.

Whom then have the latter, and England herself, to thank for the paramount influence of Russia in that country ? Undoubtedly the refusal of Mr. Canning in the first instance to observe the stipulations in existence ; and secondly the act of his ministerial tail, who by the battle of Navarino procured, not one, but a series of, "untoward" events for Britain, for Turkey, and for Persia also. That battle gave Varna to Russia ; and Varna purchased the Balkan and Constantinople. The treaty that excluded armed English vessels from the Black Sea was the consequence ; and Persia, thus excluded from our naval support, was thrown into the arms of Russia without reservation ; and the only remedy left, as discovered by the sagacity of certain Radical sages, was, to have undertaken a war in order to prevent one !

Russia, however, has effectually broken the Persian power, never very formidable for any length of time ; and constantly divided against itself. She would undoubtedly be glad to push her trade by that quarter into Central Asia, but if she creates commotions in the latter she destroys the chances of commerce. If Persia could conquer any or all of those countries, would Russia obtain them ? and if she did, could she retain them ? The fancies of tens of thousands of her troops perambulating the wilds of Tataria were doubtless very interesting, to the readers of Tatarian tales at least. But, if Russia was so anxious and so able, as asserted, to assist Persia in this very shape, how came it she sent no force there ? or, if she did, what became of them ? Surely the sands have not swallowed them all : and if they have, Great Britain has in them the best of allies, one who needs no subsidy : in this case too we cannot wonder that the far-seeing economy of Lord William Bentinck was, as asserted, the first to find them out.

If we are determined to attribute a Machiavelian policy to Nicholas, we might at least give him credit for not cutting his own throat with it ; diffusing trade by the gentle medium of the bayonet, marching armies to lose them after the fashion of Cambyzes in the deserts, and conquering impracticable coun-

tries by proxy; and this too on the faith of Persia! Would it not be more reasonable to suppose that he wished to divert her attention from his own acquisitions, by finding her a rope of sand in the East wherewith to bind a new empire? Surely no conquest of the Kuzzilbash could serve him half so effectually in the shape of injury to our Indian dominions, as this rumour of war, since it has had the disastrous result of rousing the good Lord Auckland into permanent action of any kind.

But the irregularity of Asiatic nations had long since compelled the adoption of a suitable policy to ensure, so far as practicable, security for kingdoms, by leaving a waste between them: and such, it is our own opinion, is the object of Nicholas in the present case, by rendering Persia helpless and chaotic, and incapable of receiving assistance; a barrier between Russia and Hindostan. And we do not hesitate to say that he has more to dread from the power of England in that quarter than she from him.

Though Russia has pushed her conquests eastward below the parallel of the southern coast of the Black Sea in order to secure it as a lake, enlocked within her own dominions, and without an armed competitor on its waters: and though she has followed nearly the same course with the Caspian, can we wonder at her dread of British enterprize and her prohibitory duties, daily increasing, when we notice the loss her commerce has sustained from British competition?

Her annual exports of woollen goods across the Caspian to Persia rose between 1824 and 1829 from 150,000 to near a 1,000,000 roubles; and since then they have fallen down to 140,000 roubles yearly. The sale of the same to the Nomade tribes rose from 700,000 roubles in 1824 gradually to 3,000,000 roubles; they had sunk in 1834 to 2,200,000 roubles.

Of silk goods across the Caspian she now disposes only to the amount of 50,000 roubles, and by Georgia considerably less. The Turcomans and Khirghis, who in 1828 bought the sum of 700,000 roubles, now have sunk down below 100,000 roubles.

The linen purchased by the hordes formerly amounted from 250,000 roubles to 400,000 roubles; it is now 100,000 roubles.

Iron sent across the Caspian in the above interval increased from 70,000 poods, to 258,000 poods in 1829, and 276,000 poods in 1830; in 1834 it had declined to 244,000 poods. Iron-ware by the same route amounted to 287,000 roubles in 1829; it is now reduced to one half.

To take the trade comparatively:

Russia in 1833-4 exported to all Asia goods to the amount of 17,000,000 roubles or 2,750,000*l.* sterling—

- 1,000,000 of which was for woollens.
- Great Britain in 1832 exported to Asia, exclusive of China, goods to the amount of 3,700,000*l.* one-half of which was woollens.

Russian goods thus have sunk before the English; and their price is raised in the hands of the Armenians, who take long credit and charge a high per-centage; costing from 50 to 80 per cent. more at Teflis than at Novogorod.

The repeal in 1829 of the ukase of 1821 giving the fur trade to the Georgians has been most injurious, according to the statement of Professor Eichwald; and there, as well as in Persia and Circassia, in spite of obstacles, British competition has left little for Russia, who has been almost driven out of the markets.

With such statistical facts before us, we have surely nothing to fear for our commerce—but on the contrary we can easily understand that the steady efforts at prohibition on the part of Russia arise from her dread of ourselves. We know from every person who is acquainted with the subject, the indefatigable activity of the Russian trade in Tatary and Asia; but if the facts above cited prove the superior demand for English goods, wherever they are known and obtainable, can we doubt of these commanding every market there also, and forcing their way despite the utmost vigilance of Nicholas, even were those countries as entirely at his command, and as fully regulated, as the European ports in the time of Napoleon's vain prohibitory decrees?

Having shown that active hostilities need be little apprehended, and commercial competition still less so, at the hands of Russia as to Persia; we now proceed to examine, so far as our means will allow us, the mysterious veil which it has pleased the wisdom of the present Governor-General of India to wrap round the already complicated position and polity of that country.

Although well assured from every creditable quarter, thanks to the vigilant jealousy of foreign designs and encroachments manifested by the press of Great Britain, which has thrown light more or less upon almost every dirty hole and corner of ambitious intrigue abroad; although fully apprized though their medium of the fact, which no well informed person ever could doubt, of the existence of Russian agents and spies throughout the East, the public, who had been thoroughly re-assured, at least we hope

so, by the positive declarations of the British Minister for Foreign Affairs in his place in parliament, that no danger was threatened, no sinister designs entertained by the Colossus of the North against Great Britain or British possessions; the public we say were struck aghast by the appearance of an official document issued by our eastern potentate; this was not indeed of "tremendous brevity" like the epistle of the far-famed Haroun Al-Raschid,* but its length was by no means less tremendous, nor was it less to be revered and implicitly believed as coming from a British "Commander of the Faithful," a worthy rival of the great hero of the Arabian Nights Entertainments. In this interesting publication, (we do not, as our readers might suppose, mean the Arabian Nights) if there is not quite as much entertainment to repay the perusal, there is at least an equal turn for the marvellous, as wild a fancy, and combinations as unexpected and strange as ever could be united in the "Thousand and One" Stories, which it was written, we presume, to supersede. The characters also are nearly the same, though naturally somewhat the worse from lapse of time. We recognize in it, grown somewhat elderly, the still resolute and very sleepy sultan; the gaping restlessness and anxious curiosity of the dear "sister" Dinarzade; together with the eternal narrative and fertile memory, or perhaps imagination, of the gentle Scheherazade, no way improved by advanced age, but combining all sorts of impossibilities with much of the same charm, and with nearly the same effect, of setting every True Believer to prayers. This later composition boasts, however, very material advantages over its prototype; namely in the writer's being known, and in his preservation of the unities: the death-doing, half awake Sultan Schariar, the early-rising, tale-listening Dinarzade, and the unending babble of her doom-expecting sister, who seeks to avert the danger by an endless dreamy narrative, being all combined and identified with the caliph who loves rambling, and in the dark; and all meeting in the person of the ingenious author. Greatly as we applaud this unexpected effort of a single imagination which gives us hopes that India, the source of the Arabian narratives, may yet afford us another and another pleasing supply for our nurseries, let us not

be suspected from the above expression of alluding irreverently to the rambles of this great president of the Oriental Pickwick Club, though we must confess ourselves at a loss for the reason; whether, like the Prince Zayn Alasnam, dissatisfied with the gold, silver, and diamond forms in his treasury, he seeks a ninth statue, of "defined and moderate" glory; or expects, like the Full Moon of Beder, to be rewarded with a princess rising out of the Persian Gulf at Karrack; or as Camaralzamaun, in his quality of the Moon of the Age, is borne in his sleep by Jin or meddling Spirit towards the couch of some Badoura in China itself; since in either capacity of this three-fold Hecate his mystic threat is simply,

"In a sieve I'll thither sail,
And, like a rat without a tail,
I'll do, I'll do, I'll do,"

ignorant as we are of his object, and unsuspecting of the course of his arrow-flight, we trust his lordship's toils may be rewarded by some Peri Banou, with the very little* man, three feet high, and with a beard of thirty, for his lordship, since this is a proof of wisdom. At any rate we cherish a hope that the "unknown Indian" who mounted his lordship on his wooden hobby to fly from the plains of Iran towards Kashgar, may have guarded him also from an unlimited use of the "mysterious Peg" that has borne him so high above the clouds. We trust, by the fortunate chance of another peg behind the ear, that that worthy nobleman may come down some time or other, even if equally in the dark with his prototype, to plain earth; and be found after all his "roaming, in his bower back again," though not exactly "with roses in his hair." We shall rejoice to let him off with a simple history, if we can get it, of his meeting with that "one-eyed Calender, the son of a king," our trust-worthy ally, Runjeet.

From this pleasing range of imagination we wish not to be awakened till we discover his lordship's power, like his Arabian predecessor's, to be equal to marching armies, dethroning sovereigns, and setting up slaves in their stead, without expense to his admirers at home. We cannot imagine all the recent marvels to be of his own conjuring; for it would require strong evidence to convict his lordship of a practice so unsatisfactorily negatived by the whole tenure of his life, and so completely refuted by his famed proclamations. But we joy to think how the great soul of his lordship's immediate predecessor must rejoice at the fruit so lav-

* "He dictated an epistle of tremendous brevity."—(*Gibbon*.)

"Haroun Al-Raschid, Commander of the Faithful, to Nicephorus, the Roman Dog.

"I have read thy letter, oh! son of female infidelity; thou shalt behold, not read, my answer."

* The Persian periphrasis for a great fool.

ishly borne by "the rupee-tree" after the ample pruning he bestowed on every branch of it. The one talent he possessed and hid so carefully in the earth, or in the company's pocket, has fructified (all credit to Mr. Poulett Thompson) into ten. The seeds of five or ten thousand pounds, refused to Dost Mahomed of Cabul when he was our friend, and the foe of Persia and Russia, have brought forth a goodly produce in the soil where they were kept, and to the amount of as many millions sterling in outlay for the present expedition against Persia.

Nor is it perhaps any compensation to Great Britain that this expenditure is incurred in dethroning a prince because his neighbour was attacked by a stranger. The folly of the Shah of Persia towards Kamram now, does not surely affect the birth-rights of Soojah fifty years ago. It has taken thirty years for a governor-general to discover these, from which it may be presumed they were somewhat recondite in the first instance. Soojah was sent to Jericho, and has certainly tarried there "till his beard was grown;" long enough, it may be, to atone the loss of the other "little man;" and this perhaps is why Lord Auckland is so firmly his friend, and may probably intend him to reign by Divine Right, since he has none upon earth.

With such fancies as these it is impossible to contend seriously; and his lordship, whose personal goodness of heart and amiability are unquestionable, seems disposed to joke. In the first place he declares that

"Every consideration of policy and justice warranted us in espousing the cause of Schah Soojah-ool-Moolk, whose popularity throughout Afghanistan had been proved to his lordship by the strong and unanimous testimony of the best authorities. Having arrived at this determination, the governor-general was further of opinion that it was just and proper, no less from the position of Maharaja Runjeet Singh, than from his undeviating friendship towards the British Government, that his highness should have the offer of becoming a party to the contemplated operations."

In the second place we learn that

"A guaranteed independence will, upon favourable conditions, be rendered to the Ameers of Sind; and the integrity of Herat, in the possession of its present ruler, will be fully respected: whilst by the measures completed or in progress it may reasonably be hoped that the general freedom and security of commerce will be promoted; that the name and just influence of the British government will gain their proper footing among the nations of Central Asia; that tranquillity

will be established upon the most important frontier of India, and that a lasting barrier will be raised against hostile intrigue and encroachment. His majesty Schah Soojah-ool-Moolk will enter Afghanistan surrounded by his own troops, and will be supported against foreign interference and factious opposition by a British army. The governor-general confidently hopes that the Shah will be speedily replaced on his throne by his own subjects and adherents, and when once he shall be secured in power, and the independence and integrity of Afghanistan established, the British army will be withdrawn. The governor-general has been led to these measures by the duty which is imposed upon him of providing for the security of the British crown.

The first statement can never be made in earnest; who are these unknown "best authorities?" Lieutenant Burnes cannot be one, for he has said the precise reverse; and the fact itself seems to have been unsuspected in Cabul, and by those who knew it well. The amiable and talented Soojah, the weakest of mankind, had violated the sanctity of a harem; the worst offence to the decency of life and the security of property, known in the East. He was driven from a throne he had won by the arms and talents of his vizier, and by the treachery of a hostile general to his opponent. How did he behave to the former?

We must, however, admit that the whole population is attached to him, since the governor-general says so; and undoubtedly the attachment must be very strong and deep-rooted that never showed itself anywhere: that had never seen his face for thirty years, if at all, and had never desired to see it again; that had steadily resisted, when he tried to return, all opportunities to behold anything of him but his back; while his own soldiers showed him theirs before going into battle. This is not the usual mode of evincing affection, at least in Europe: but the governor-general, as the first discoverer, has the full right to his invention, and he uses it by enforcing the return of Soojah the Desired with a force of 35,000 bayonets. We remember in Lord Wellington's time that this first captain of Europe refused to enter France leading the French Princes, though Louis le Desiré had a claim on the affections of the country, through the long ages of his ancestors' reign. The precedent, we submit, is not too low for Lord Auckland to follow.

We see, in fact, three arguments for this espousal of Soojah's cause, but neither of them openly avowed by the proclamation. First, that having no claim to the Musnud, he may become the tool of Great Britain,

like the subservient King of Oude. Second, that he may be more easily dethroned than an abler man, whenever it shall please any resident at his court to seize the crown for England. The third and strongest point in his favour is, that if Soojah has no claim on the British government, he has none anywhere else, even from his subjects, from whom he has so often fled. The Tories boast as their leader the hero of a hundred fights. The Whig government in India select for theirs the hero of a hundred flights.

The introduction of Runjeet into the treaty is but a further point of the same view. He was at war with the Affghans who detest him as an infidel, and the interference on his part, therefore, will doubtless increase the thirty years' patient affection felt for Soojah. The scorner of domesticity, and the scorner of religion, will doubtless be heartily welcome, and ought to appear in conjunction.

The guaranteeing independence to the Ameers, who possess it already, is very liberal but somewhat supererogatory. These gentlemen are, however, satisfied to possess the substance ; and object to opening the door to the wolf that he may feel the pulse of the patient. They are even mustering their forces to oppose this benevolent demonstration ; and we cannot wonder at it altogether, seeing the faith of British treaties, as in Oude, before them.

The same may be said of Herat and Cabul : when this is conquered, the British army is to be withdrawn. What, is there no future to come ? We rejected the alliance of Dost Mahommed, and to prevent his forming a league with Persia and Russia to-morrow, we are driving him into it to-day ! We shall blame him, and him alone, if Russian troops come to his assistance ; the aggrandizement, the ambition will be all the Emperor's ! And we, who shall thus extend our frontiers on all points, north and west, and interfere to make new enemies and sow new jealousies in Tartary, at ten-fold trouble, time, and expense, to say the least of it ; we, who are forcing our rule upon all sides that we dare attempt it, we are the sole martyrs—the victims to Russian ambition !

If, however, 5000 British troops can win all Cabul for Soojah, while 30,000 Persians could not take a single town, why do we fear Persia so much ? Why do we feel alarmed because a weak and vaunting fool like the Shah dreams of marching through Cabul and Candahar, to Segistan, Moultan, and Beloochistan, and thence probably to Calcutta ? When this hero of the seven-leagued boots failed in his first step, might we not answer to the rest like Sterne's Giant

to the Dwarf threatening his pigtail, "that he was welcome, if he could reach it ?" The first sound of active opposition sends the modern Nadir to his own country, and to prove to him the wickedness of assailing Cabul, we seize it ourselves. Really the Shah and the Governor-general are aptly matched. With orator Henley, "we know whom we beat."

The proclamation hints darkly but plainly enough at the designs of Russia, and so every man in England understood the allusion. Lord Palmerston has but just declared, for the twentieth time, that Russia has no such designs. Then which are we to believe ?—for he contradicts the Governor-general of India. All the ministry, as Lord Melbourne avowed, concurred in Lord Auckland's doings ; then all differ from Lord Palmerston ; and he also from himself ! This is a singular double contradiction, and hitherto unnoticed, we believe ; and yet there is a third ; for satisfied as the noble viscount has ALWAYS declared himself with the friendly conduct of Russia, he has yet thought it necessary, apparently constantly, to demand explanations of that conduct.

With Lord Auckland and Lord Palmerston in such full opposition to each other, both cannot be right ; but both may be wrong. A thing cannot be and not be at the same time. Is there no mystery behind this ?

The position of Nicholas and his ministers, which we have dwelt upon at some length, may furnish a part of the clue ; and we refer to Mr. Bremner's recent excellent work upon Russia,* which we regret has only just fallen in our way, to bear out our allegations, and throw complete light upon the position internal and external of that power, and on the personal character of the Emperor. No work of the present day can exceed it in minuteness and exactitude, and its extent enables the writer to carry out much that we, before its appearance, had had in type of the present article. The readers of that work find a new field of inquiry and information laid open to them ; and had it been earlier published, it would have saved them much incertitude. On the "Views of Russia," however, and some other points, we cannot hold with the writer, but shall state our opinion presently.

It is clear that the dark hints to which we have alluded as affording the governor-general a veil to throw over his mysterious policy and projected feats of arms, must undeniably refer to Russia ; because the conduct of the Cabul chiefs is openly treated, and

* Bremner's *Excursions in Russia*. 2 vols. Colburn, London.

also the Persian invasion. There can therefore be no question of any third power sufficiently formidable to call forth all these military movements of our Eastern armies upon that frontier, if not Russia: since the ministers at home concurred without exception in the measures taken by Lord Auckland, it is evident therefore that Russia must have been at the bottom of all: yet we are formally told by Lord Palmerston that there are no proceedings on her part. Had not Persia a right recognized by Art. 7 of our Treaty with her in 1809, to make war against the Affghans? Our right to interfere, so far as defending our own frontiers gives, was admitted, but whence comes the right of extending it? Could not the Kandaharee chief go to war with Runjeet, could not our neighbours be left to weaken themselves by incessant warfare without our directions? and was not this distracted state of the border rulers a proof of intestine jealousies that formed a safer defence to ourselves than an extension of our sway, in the face of every right, into a new field of dominion? The Sikhs of Lahore and the Affghans have a religious feud; the latter detesting the former as infidels. They had coalesced previously for a time, when, in 1834, Runjeet was to replace Soojah on the throne, it may be argued; yet this was with but a small portion of the disaffected, and against the Affghan nation; it is therefore no proof of cordiality, but of union of interest only; and the previous conduct of Runjeet to Sooja, whom he robbed and plundered to absolute beggary when the latter took refuge at his court, shows the motives of Runjeet Singh, and the degree of faith and friendship to be expected on either hand. In this projected invasion of the Affghans, our allies, the British Government in India acquiesced.

The Affghans, who hate the Sikhs, were preparing a religious crusade against them when the governor-general so recently interfered from dread of their uniting with the Persians. But the Affghans hate the Persians also, with a religious animosity, for the former are Soonis like the Turks, the latter are Shiahs. The sectarian hatred of the Turks and Persians has alone, and always, prevented them from co-operating for any time. The same would be and has been the case between Persians and Affghans: and it is unquestionable that this hatred has always been the source of the aggressions on both sides, and of the recent energetic defence of Herat. In fortifying this town, and in the broken and divided state of all Cabul, therefore, a far stronger and more honourable source of security existed for our

Indian possessions than in our advancing claims upon sovereignties for our needy dependents, opening a new field for our own aggressions, interesting strange nations to unite against us, giving them ample food for alarm at our encroachments and ambition against weak and divided states, and adding to the discontents already existing throughout India, a fresh source of expenses, dissensions, protections, and wars, in Central Asia also: and all this, be it observed, while Russia is in no degree scheming against us, according to our Minister for Foreign Affairs.

"Cabul and Kandahar are the gates of India," is quoted by the author of a sensible and able pamphlet,* though somewhat alarmist perhaps, as the sound dictum of an Indian conqueror. In his day undoubtedly they were—they are so still; but could they not be held by a native prince, actually in possession of them, without injury or expense to ourselves or violation of the rights of others? And, if assailed, would not a British subsidiary force aid in holding them so soon as aid was requisite for the purpose? As matters stand, who can blame Dost Mahomed for throwing himself under Russian protection; becoming tributary, if needful, to Russia, or to Persia. If Russia came down into Central Asia to support her new ally, would not she act itself, and, if we are to believe Lord Palmerston, the initiative also, be owing only to Lord Auckland's premature terrors and aimless heroics?

The best defences of our frontiers would be in the love of the different native races: the really formidable Persian irregular horse would then be met by at least their equals in the open plains; that is to say, by the Rohillas and natives of the Northern frontiers, the finest soldiers in Asia; the former strongly recommended by the late Honourable Mr. Shore, and Captain Westmacott,† and by every man acquainted with India, as invaluable in the field; and yet both these gallant races have we outraged and alienated by our proceedings, at Oude, &c. in the former case, and by the unjustifiable seizure of the free military tenures, a scheme devised by Lord Hastings and perfected only by Lord Auckland!

Had 5000 men in the first instance been moved towards Herat, it is clear the Persian Shah's stay there would have been short; and all the mad expense and impolicy of an

* India, Great Britain, and Russia.—*Bailey*, 1838.

† "Present and Future Prospects of our Indian Empire." This, and Shore's Notes on India, are awful expositions of British injustice and folly in the East.

offensive treaty with Shah Sooja avoided; and the costs of preparing 35,000 men obviated at once. But the whole frontier was excited needlessly against us by Lord Auckland's previous policy, from Hyderabad to Oude; and Runjeet Singh, too cautious to be outreached by English moderation, distrusting the Usurper-General, who had seized Oude on the one hand, and was about to seize Cabul on the other, as having possibly an eye to his own intermediate dominions, contrived to delay and flatter the pompous weakness of honest Lord Auckland, (honest Iago!) and delay the whole affair, till, had there been any real ground for alarm, it would have been too late to act. No doubt he was and would have been secured by treaties, such as Oude relied on once; but he had better secured himself meantime by a supply of the best arms the East India Company could furnish him, during his own life-time, and required no new Colonel Low to ensure the succession to his offspring after his death.

A glance at Wyld's map of the countries between Turkey and Birmah, (compiled, as we are happy to bear testimony, from very recent and authentic sources, British and foreign,* and of the highest merit) proves unquestionably that Hindostan has two strong outworks between it and independent Tartary to the North-West, in the Kingdoms of the Punjab and Cabul, and two efficient barriers between it and Persia, to the West, the barren wastes of Mekran and the waters of the Indus. The Parsee navy, the Anglo-Indian shipping and steamers, are surely enough to maintain the passage of this last; and is not Cabul, with its incessant mountains and difficult passes, easily to be maintained by native troops against invaders, if only we will exert our diplomacy against Russia, and not run headlong against the first stone wall we can build against ourselves?

A simple alliance by which Kamran should be maintained, and the Barukhzyah

brethren confirmed in their possessions;—all held by right of conquest, and Soojah himself is not the right heir, there being one nearer claimant by descent in this case, as in the Oude question also;—would do more to alleviate the dangers and strengthen the position of British India, than all the recent expenses, so confessedly vain and thrown away, of the Governor-General, and which have had but the one effect of uniting all the frontier powers against our course. Well may even the Shah retain positions in the vicinity of Herat, if upon defensive grounds only, with so determined an hostility against him, weak as he is, yet not altogether unamiable, and bitterly offended at having to treat with an untitled minister from England. Mr. Macneil has had, in this alone, a serious difficulty to contend against; and if his services were worth employing, it is a pity they were not made most efficient by so simple a form of dignity as knighthood at least, against the full powers and European dignities borne by his antagonist Simonivitch.

If to the foregoing considerations we add the fact, that of £800,000 sterling, the amount of the duties annually at Cabul, the greater part by far is supplied by the British trade; if we recall the statements respecting that with Central Asia and its triumphant progress against Russian commerce; when we consider that Persia not only receives our goods, but has confessed the importance of this trade, even recently, in the continuance of it under the auspices of the Court, when the Sovereign is most mortified and irritated against us; if we find that inclination towards British education is felt in even the seminaries of Persia, and that our opinions and modes of thinking are anxiously consulted and rapidly gaining ground there; and finally, that from Lahore itself repeated applications have been made to establish a system of English education there also, we need be under little apprehension for any chance of future preference of barbarism to civilisation, unless by the injustice and ambition of our Anglo-Indian Government. If Russian enterprise should precede us in any portion of Central Asia, will not our commercial activity by the Indus, in spite of all obstacles, enable us in the superiority of our manufactures to produce the same effect as in the more Western parts of Asia, to which we have alluded above? It can only require common attention to our interests, and maintenance of a character for high faith and real moderation, to ensure us from rivalry of any kind in these quarters.

And here we must refer to the opinions of Count Bjornstjerna, a diplomatist of ac-

* For instance, the coasts of the Red Sea, we observe, are taken from the Surveys of Lieutenant Wellsted; and the coasts of Arabia the same: the Persian Gulf, from the Indian Navy survey, in two sheets: the country to the North of the Aras, from the sketches of Baron Meyendorf and Mouravieff: the Caspian Sea from the Large Chart of the Russian Admiralty: consulting also Monteith's Map of Armenia; Colonel Sutherland's map of the Province of Azerbaijan; Colonel Rottier's (in the Russian service) sketches of the Caucasus.

The position of Candahar, we perceive, is laid down one degree different from *Burnes*, and from *Arrowsmith's* large map, but it agrees with the Russian sketches and maps. The difference is of the highest importance in military and other calculations.

knowledge foresight and ability, and from which nothing but the vast importance of the general views we have been submitting could have so long detained us. The Count notices the chances for happiness for the natives in the superior cultivation of our countrymen, and stability and regularity of our form of Government; but he considers these advantages balanced by the natural love of liberty that accompanies civilisation, the restlessness of various native tribes, especially those thrown out of the system they lived by, of war and violence and plunder, and particularly the natural dislike of a foreign race, of conquerors or settlers. The Mussulman he regards as less attached to us than the Hindoo, and the upper classes of these last less so than the lower, who have ever found a protector in the British Government. He observes, however, that the repeated acts of injustice, the deposition of native princes and rajahs by the English, is a serious objection to the natives.

As to foreign enmity, Count Bjornstjerna considers it more dangerous as acting indirectly than directly, though we conceive he underrates the means of annoyance from the East.

The North West frontier he considers to be the only one vulnerable, as the line of the Indus is not our real boundary, but that of the Sutlej; the former river being the limit of Lahore. Still the Count, and he is a military man of the highest reputation at home, opines, that we might defend the 200 geographical miles of its course, as supplies and troops would be easily received and maintained: our force of 180,000 men could soon be increased, with auxiliaries, to 240,000. One-third, according to him, might unite with the Rajahs of Lahore and the Ameers of Sind; (alas for Lord Auckland's policy towards these!) one-third might form a reserve behind the Sutlej and Loony; and the remainder preserve peace at home: while the advanced posts would extend to Peshawar and the Solimân chain of mountains. This position the Count considers would enable our force to march effectually to any point assailed.

The great changes in Central Asia are dwelt upon at considerable length and with great ability, and the alteration of attachment to ourselves in fifteen years calmly but effectively reasoned upon. Into this we need not now go.

Of Russia, Count Bjornstjerna says, that the change of ten years has made the invasion of India now within the verge of *possibility*, since the Dardanelles and Bosphorus are opened to her and closed to all other nations. Observing her extensive acqui-

sitions to the Aras and Ararat, and the desire long felt by Central Asia to conquer Hindostan, he considers, nevertheless, that the troops that could assail it could only be irregular cavalry, and no match, consequently, for regular forces, provided with artillery.

We take from a very able writer, acquainted with the scenes he animadverts upon, the following remarks, in corroboration of M. Bjornstjerna's opinion and our own:—

“The Tartars are jealous of foreigners, hardy and warlike in their habits, to whom the political intrigues of Russia and her insatiable lust of power are well known; and few, who are acquainted with them, would easily believe that, in any case, would they voluntarily ally themselves with a power that has successively engulfed all the petty tribes which exist along her southern and eastern frontier.”*

We quote the same writer's opinion regarding the native States of India:—

“At that epoch I was in the Mahratta States, and had full opportunity of judging whether there was any evil feeling evinced towards us by the princes of that country, unquestionably the most warlike of all the native sovereigns, who are either tributary to or in alliance with us: and I am quite sure they were little affected by the rumours which reached them of the ill success which at first attended our arms in coercing the golden-footed monarch.

“The fact is, they are so little accustomed to cultivate foreign political relations, so self-concentrated in their views, so occupied in petty childish intrigues about precedence, etiquette, &c. that, unless foreign assistance was at their door, they would not lift a hand to break through the tutelage in which we hold them.

“I allude particularly to the states of Poonah, Nagpore, Oujein, Hyderabad, and the thousand and one petty chiefs who are spread over the territory of India within the Ganges. The public may be certain that it would require a long series of reverses to our arms and policy to rouse into action the sluggish spirit of Indian independence: indeed, I know not whether such a spirit exist at all; unless we dignify with that name the despotic wish which the native princes may perhaps occasionally indulge in, of governing their subjects without the wholesome restraints of the law.”—*Russia versus India*, pp. 17, 18.

Again:—

“Thousands of Mussulman Hadjis, or pilgrims, annually leave India to visit the tomb of the Prophet in Arabia. In the course of their journey through Mohammedan states,

* *Russia versus India*, or Observations on the present political Relations of England with the East. By an old Indian. Richardson, 1838.

they occasionally witness the arbitrary punishments inflicted by cazis or judges on delinquents. The felek or bastinado, by which the feet are battered to a mummy, the putting out of an eye, and sometimes altogether extinguishing the sight, are a few among the many horrid modes in use in Persia and Arabia of making a culprit expiate his offences against the law.

"These punishments are inflicted so summarily, that the most unfortunate mistakes frequently occur, and the innocent suffer for the guilty. How do these pilgrims, on their return home, bless that mild administration of justice which characterises the government under which they live, where even the 'law's delay' affords an additional security against its abuse!

"Indeed I have heard intelligent natives expatiate with enthusiasm on this subject, and have seen them shrink with terror at the idea of living in the neighbouring states of India, such as Pegu, Nepaul, &c., where criminal jurisprudence is practised with all the horrid refinement of Eastern barbarity." —*Ibid.* p. 36.

Count Bjornstjerna's work is undoubtedly able, and is adapted rather for his own countrymen than foreigners; a portion only of it is political. To the remainder we may return hereafter; satisfying ourselves for the present with saying, that it does high credit to the author's intellectual powers and studies in every branch of the subject.

In closing our notice of the subject of India we must observe, that the dangers that could so quickly pass over harmless, could not have been so formidable as represented by the Indian press, and still more so by the governor-general: and we have, we trust, shown that his policy was alarmed and premature; that haste of fear—

"————— that from the first
Wild with blind dread, accelerates the worst."

It is clear that Runjeet Singh, our very respectable ally, sees his interests at all points to be in consorting with us and keeping us from any interventions in his own favour, while we play his game of dissensions in Cabul and Affghanistan; and our own in Hydrabad and Oude. The instructions respecting this unhappy country, so suspiciously withheld, under pretext of not yet being enforced, though acted upon, until time and other matters, now approaching, shall divert public attention from the subject, certainly require parliamentary and national interference. At present we are half inclined to agree with the natives of India, who have discovered but one fitness for his office in the President of the India Board; and this in the mysterious initials that precede his surname, as indicating his personation of John Company.

Having thus examined the prospects of British policy in the East, and exposed our own decided opinion, and that of various writers fully competent, in our judgment, to decide the question, of danger from Russian schemes in that quarter, we must now turn to Europe, and see what is the actual situation of affairs here, with reference to the views of Russia.

Of Norway, which M. Bremner, in common with several others, considers an object to the Emperor Nicholas, as opening the North Seas to his Baltic fleets, we need merely observe, that the nation itself is jealous to excess of foreign influence, that it is now, in a great measure, reconciled to Sweden, and participates in its reluctance to increase the power of Russia. Most assuredly it prefers its present condition infinitely to coming under the yoke of the latter power; which cannot approach Norway without outraging Sweden.

Sweden herself has never forgiven the loss of Finland; and if she could be indifferent to this, not so are the Finlanders themselves, who detest the Russians, and would gladly take the earliest opportunity of throwing off their masters if the least prospect existed of succeeding in the effort. They now bitterly repent their own lukewarmness in the war of conquest, and the misconduct, if not treachery, of their nobles. So satisfied is Russia of the active hatred felt there against herself, that her fleets are kept in constant preparation and display along the coast, and her internal police is vigilant to excess throughout the country, to overawe the inhabitants, whom no efforts have yet conciliated.

The force collected by Russia in Aland is undoubtedly formidable to Sweden, whose small but respectable and well-prepared fleet would be no match for her mighty antagonist in war. The Swedes are brave undoubtedly, and each vessel would certainly do her duty to the utmost in case of need; but the Swedes understand better fighting ship to ship than the management of a whole fleet. The expenses too of a large squadron would be too heavy for the state, but there is a most formidable force of gun-boats kept up, amounting, with those building in Norway and Sweden, to between 3 and 400; a force amply sufficient, not only to guard their coasts, but seriously also to annoy any enemy in the Baltic, however strong in ships of the line.

Denmark, whose existence depends on the Sound-duties, is undoubtedly supported by Russia in the claim for these, and so far is connected with the latter. But she knows also that Russia uses this right of hers but

as a safeguard and outpost for her own fleets, and that she herself avoids those dues by conveying her merchandize chiefly overland by Lubeck, evading here also the duties imposed on other nations, and from which she is alone exempt; not indeed by the favourable feeling of the Danish Government, but compulsorily, from the necessities of position in the latter. Disliking Russia, and preferring England to her, though not particularly partial to the latter, she yet knows that a single effort of the former would destroy her own power at once, and succumbs for the present, though with palpable reluctance, to this "stranger within her gates."

The position of Prussia we have repeatedly noticed: when Austria retired from general Germany to her own southern portion, Prussia assumed the post of leader for the northern part, by her commercial league, which operates effectively, and as she well calculated, in a political sense also. Her strong cordons and vigilant eye in Poland against the slow but steady encroachments of Russia in that quarter mark, as well as other facts noticed by us elsewhere, her resolution, and her power to resist Russian influence in future.

The position of Austria is altogether changed, and her policy has changed with it, as the recent treaties evince. From the time that she resigned the nominal empire of Germany, and more especially of late years, this great power has devoted much attention to the condition of her Southern provinces and their neighbours; that is, the states of Italy, and the Turkish dominions joining her own. With regard to the former of these it has long been the intention of her most consummate statesmen to form, so soon as Italy could be adapted for it, a sort of Federation under the protection of Austria. This project, we understand, is now under consideration and intended speedily to be put into execution; so soon in fact, as the miserable jealousies of the Italian States towards each other can be harmonized, and something like consistency obtained to build upon.

The treaty recently concluded for the navigation of the Danube, though differing little in form from one to which we have elsewhere alluded in a preceding article of our present Number, is yet far more important in its actual efficiency, which is greatly increased by the stipulations respecting the Black Sea trade. The increase of the Austrian navy is thereby assured; her connection with Turkey cemented; and more important almost than these two considerations themselves, her political influence is extended towards the independent and Turk-

ish provinces, over the commerce of the former of which she extended her protection by the convention of 1835 with Greece. Her own commercial interests in truth, Eastward and South along the Danube and the Adriatic, compel her attention to these points, which bring her, the latter into connection with Britain and Turkey, through Italy also, and the former in direct competition with Russia.

If the heavy duties recently imposed in the Turkish Treaty upon the produce of Moldavia and Wallachia, can be, as we hope after a time to see it, modified in their favour, the inducement of these provinces to maintain the connection of trade will doubtless be strong in favour of the High Contracting parties: but in the meantime, regarding the pains they formerly took to exchange the Turkish for the Russian connection, they will be taught by the loss inflicted that Russia is not all in all for them; and the disadvantage to commerce thus coming on the back of the intrigues against their independence on the part of the latter, will greatly assist, we conceive, the reluctance of both, and especially Wallachia, to the growing assumptions of Russia over their governments.

Of Servia we have spoken largely in the article referred to, and need therefore only class it with the districts on the Austrian frontier, with Bosnia, Croatia, Slavonia, Dalmatia, Albania, and in fact with all the range of country extending to Greece, and to Turkey strictly so called. In a former Number we noticed the military line of these countries; we must now consider them in a still more important view.

We have expressed our conviction that the acquisitions of Russia on the Persian side have been more of a negative than a positive tendency, so far as influence is concerned; intended rather to act as a barrier to British political as well as commercial interests against her own, than as a source of absolute danger to British possessions in the East; though with a prospect of affecting these indirectly, and raising alarms, and adding to our pecuniary and political embarrassments there; fast increasing as these are under the tutelary genius of the actual Governor-General. It is, we affirm, only a minor attack, or feint.

On the other hand, considerable interest has been excited by Russia's proceedings towards Turkey, and the worst auguries elicited if she should succeed in her designs against the latter. We have expressed already our doubts as to the reality of the danger and its imminence in this particular quarter: and as, in so doing, we have run coun-

ter to the general impression of Europe, and the decided judgment of every one of our contemporaries, we must assign at some length our reasons for this difference of opinion, and point, to the best of our means, the real source from which danger may be apprehended ; the real views, in fact, of Russia, entertained and acted upon steadily for the last twenty years of her political existence, but apparent much earlier ; though then in common with other schemes, since rendered subservient to the one grand object.

We have dwelt upon the position of Persia, as offering now both a bar against any intrigues or proceedings with the Caucasus, &c. in the South-Eastern part of the Russian Empire, and as a point of support to Russian intrigues as well as to Russian commerce in the East. This, we have endeavoured to show, is all that can be made of Persia, without a larger aid from her European neighbour, and a better system in herself than can be expected. We conceive, too, that Turkey, so much nearer the views of Russian policy, is not farther desirable as a possession than by connecting the different points of Russian enterprise ; that held by a friendly, and so to say, subservient power, she would offer the latter all the advantages and none of the difficulties of positive occupation ; for great as the former would unquestionably be, the last would at least counterpoise them, in the jealousy of the native Russians at a new capital, so far superior to the ancient one and to her more modern rival, and which must necessarily draw all interests and active power from them to itself. Farther, the positive hatred of the Turks for the Russians themselves, as usurpers and unbelievers, and the want to any extent of that great bond of sympathy, a community of interests ; together with the expenses which this continued subjugation would entail upon Russia ; and the extent of frontier among uncivilized tribes that must be maintained : all these considerations, and the sacrifices they would require, could not certainly be met by Russia in the outset at least, whatever the supposed extension of her trade in consequence might in time produce.

The possession of Constantinople, however glorious and imposing, could offer no advantage beyond what was obtainable by holding Turkey as a subservient power simply : and such only, we conceive, it is the object of Russia to make her. So long as she holds the Dardanelles and Bosphorus at the command of the Emperor, his territories are as secure as if they were in his own keeping : so long as Turkish produce is

monopolized by the government and farmed to influential individuals alone, who prevent its export by enormous prices, saddled too as it is with duties, imposts, taxes, direct and indirect, Russia enjoys the advantage of directing the monopoly by influencing the government, and thus pursuing her own commerce without a rival. Were Russia at war with other great powers, such as England, France, or America, Turkey could supply, if nominally independent, the produce of these countries to Russia. The jealousies of a hostile creed and population, dangerous at all times, formidable to a conqueror in any complicated military and distant operations, would be avoided by thus keeping in indirect subjection a people who would be obedient to their own native rulers, but fanatically hostile to foreign sway.

The course of the Russian government would seem to countenance fully this view of the case, which, until they are sufficiently strong to defy the jealousy of European powers, is the only one maintainable : and the strong opposition of Russia to the change of the ancient mercantile system of Turkey, and the obvious anxiety to retain her in consequent helplessness, is explainable on no other grounds, since the free commerce of a free country would in other points of view be advantageous to her neighbour. Nor is this the only indication, as we shall shortly see.

Secured by the submissive dependence of Turkey and Persia, the Black Sea and the Caspian occupied by her vessels alone, and the Dardanelles and Bosphorus closed to all intervention, Circassia could not long hold out ; and the Caucasus, whose wild wastes cost Russia not less than 8,000 men annually, from the mere severity of the service, and independent of an established war there against her authority, would be forced by degrees to submit. With such ample territory as she possesses, what then would be the real wants of Russia ? In truth that, and that alone, which was the great want of Napoleon—Ships, Colonies, and Commerce. In the absence of these she is comparatively powerless ; a body sufficiently large, it is true, but deficient in the vital fluids that give life and vigour by active circulation. We have seen that the overland trade of Russia is insufficient to hold its ground against the competition of the possessor of the seas ; and since rail-roads cannot be formed as yet throughout the interior of Asia, the more bulky articles of commerce and manufacture must be transported by water. To what source then can Russia turn to obtain this, to her the one, sole, essential principle of commercial existence, power, and prosperity,

even at home, within the vast and now languid extent of her territory? The answer is—Greece.

Whatever might be the conveniences of possessing Turkey, there is not one of these that cannot be obtained by the possession of Greece. The commerce, if not command, of the Mediterranean would then be for Russia; Great Britain and France might be safely set at naught; Egypt would lie at her feet; the land trade of Asia Minor, &c. could be increased considerably as of old; Italy would be held in check; Austria would see a far and hopelessly superior navy hovering over her coasts at any moment when the movements of Northern or Central Europe might tend to give uneasiness to her great rival; and Turkey would be only the slave of her neighbour, existing then, and then only, upon bare sufferance.

If we examine the simplest outline of Russian policy, we shall see that this has been its real object for a considerable time, though veiled under different pretexts. Such was the affection for their brethren of the same religion in Greece, and in the Turkish provinces; such was the imputed ambitious views and faithlessness of the Porte; such the necessity for occupying ports in the Adriatic against France and the ambition of Napoleon, and against the co-operation of Austria; such the reluctance to restore these till insisted on beyond the power of evasion at Tilsit; and such the real motive of separating the principalities from Turkey. The instant this was done—the instant that Greece became independent of the latter power, this ceased to be the object of Russia; her Mediterranean labours and intrigues were for Greece alone; and Nicholas could with perfect security and perfect sincerity give his word that Constantinople was not coveted, nor would be held by him.

What indeed would be the advantage of it, unless as secondary to the more important point? With the free passage of the Straits open to Russian fleets; with the ample security of Greek harbours at every turn for her navies, her merchantmen, and smallest craft; with the supply of Greek seamen for every branch of service; and with the position of Greece for commanding the Mediterranean, well might Russia boast openly then, what her minister of marine once unguardedly avowed, "Greece alone once ours, we laugh at England, and France, and Austria." The combination of these three would be rendered next to impossible by the difference of interests then induced, and the different degrees of exposure to danger. Then a large Baltic fleet off British shores would expose the coasts of England to the

annoyance of sudden descents, and require three times the number of vessels to guard the whole line from insult: or sailing down into the Mediterranean, would sweep that sea of British fleets, and impose conditions on the helpless and undefended shores of Austria. It is not for nothing that the Emperors of Russia indulge in this expensive toy, as it is termed; this freak of fancy at present, but the means of a surer advantage whenever the time and opportunity serves; but not till then.

Greece once in the possession of Russia, Constantinople must be hers; virtually or actually, it matters not which. Were it now seized it could be retaken; such at least is the opinion of the Russian engineers themselves, who coincide in the opinion so boldly and well avouched by the Marquess of Londonderry in opposition to "the long and military hypothesis" of Marshal Marmont. It might cost the Russians 200,000 men, but it could not be retained by them against the allies as affairs stand: and even if they could keep the city itself, could they hold the whole country against the Turkish population, aided by Austrian troops, and assisted by the navy of Great Britain in the Euxine and Adriatic?

Alter the case, however, and give Greece to Russia, the hostility of Turkey would be harmless and isolate. The supplies of an invading land-force from Austria would be cut off by sea; insurrections like that of the Montenegrins at this hour, would be nourished to endanger its land communications; the Archipelago, with its islands occupied, would bar access to the British navy; the sea of Marmora would be closed to the Turks; and though they might retain the Dardanelles, that formidable passage would be avoided by the possession of the country; while the neck of the Chersonesus between the Dardanelles and the gulf of Saros, scarcely five miles across, affords the occasion for a canal in the neighbourhood of Boulair, between the two rivers that run nearly north and south, the first from Echiftilik and the gulf of Saros, long. 44.36, the other from the sea of Marmora, slightly farther to the eastward; a labour of about two miles would unite these, and open the Asiatic as well as European coasts of Turkey to the ravage of a Russian fleet.

It is obvious that the march of Russian policy, tending from the Pruth to the Adriatic, has fairly roused the activity of Austria, and brought the progress of the two powers and their influence fairly into collision, both mercantile and political. The navigation of the Danube, aided by the canal projected from Hirsova to Khustenji, and which has

been so strongly and successfully urged on the Porte by the Austrian Government, while it brings the provinces in question into closest connection with the latter, thereby invigorates them also to renew their rivalry of Russian trade, so soon as the nine per cent. indiscriminate additional duties, imposed by the recent Treaty, can be removed. Russia has shown her jealousy by the additions to her force in those countries.

Wallachia, Moldavia, Servia, Bosnia, and Bulgaria, all Christian, are of the more value to Russia, as they break up the line of opposition, and sever the links of the chain that unites Turkey to Austria; and through Hungary, ever sympathizing with, and ready to join, their half-brethren the Poles. The favourable disposition of Austria towards these in some stages of the late insurrection was unquestionable: and if either of the two races, in Hungary and Galicia, are impatient of Austria in minor degree, yet they far more detest the despotic principle of Russia.

Moldavia, and the provinces down to Greece, form a strong line of obstacles certainly to the march of Russian policy or arms; but the obstacles are negative merely. Roumelia and Albania are purely Turkish; but the positive and negative have been wisely seized of late by Great Britain, whose numerous appointments of Consular Agents to almost all the foregoing provinces, is viewed as a political rather than commercial step; a support to Austrian policy at the hour, a preliminary to the Treaty, and a check to Russia. This is particularly the case with Dalmatia, where the commerce is trifling, whatever it may be hereafter; but where activity and energy are wanting to counteract the Russian proceedings and intrigues with the Montenegrins, for the one desired object of Cattaro; the great outlet to Greece itself. The activity of Tatischeff for his country's interests is not less ominous to us now in that quarter, than when in his early youth it was exerted so dexterously, so unsuspectingly, and so prejudicially to Napoleon.

The views of Russia, then, we trust we have made it apparent, are in reality addressed to Greece itself, and towards Constantinople only in a secondary sense. Mistress of Greece and of the Archipelago on the west, and of the Black Sea on the east, it would surely be immaterial who holds the intervening line, the gate of the passage that must be at her disposal, if not in her possession. Hence her vast efforts in the Black Sea, the real source of all danger, and her ever ready fleet, of but secondary importance, however, in the Baltic; whose

junction at any moment with the Euxine force in the Mediterranean must be fatal to Europe, as overpowering all possible opposition. Even Turkey seems to have taken the alarm in that quarter. Her naval preparations, her large importations of English gunpowder, though amply supplied besides from her own manufactories at home; her purchase of steam-vessels for the Black Sea, and her construction of steam-frigates, two of which are in progress now, show her not insensible to the danger of suffering Russia to accumulate, as she is doing, the many steam-vessels she has in service there. What in fact are the objects of the latter? Her fleet in the Euxine is surely too strong for Circassia alone. Does she intend to assail her former protégé, Turkey? and why? And is the Turkish power so formidable as to require, at any cost, the hire of English and other foreign ship-builders in the Black Sea harbours, the engagement of British and American seamen in the Black Sea fleet? The enormous expenses too of the Baltic squadron, continually renewed and increased as it is, in despite of the destructive worms of the Neva acting on the indifferent materials of its construction,—What is it for?

We are well aware that as the waters of the Black Sea are everywhere deep close in-shore, so that line-of-battle ships can ride up to the edge almost, Russia has carefully fortified her stations there, not with cannon alone, but with every new invention obtainable since the last war. While some of these have been rejected from foreigners by ourselves, on the principle that we could wish no alteration in the system of naval warfare, and should therefore be the last to adopt it, she has embraced all offers, made liberal proposals, tried every experiment, fished out every secret, disappointed the various projectors, if they are to be believed, of their reward, and employed the most effective of the projects secretly and for her own security. Sebastopol, for instance, is utterly unassailable in the old way.

Much has been said of navies. We have no fear of invasions, even though within the last twelve months a Russian agent has taken plans of the various English harbours, and in especial of the soundings, &c. at the entrance of the Thames. If meant for actual hostilities at any time, the attempt would be ridiculous, and our large steam-force secures us against surprise, abroad as well as at home, since our vessels could be towed to form a junction much faster than any regular fleet could sail against them. The Russian ships, too, are built of bad timber, and make much bilge-

water ; the crews are brave but not active ; and if tolerably efficient at the gun, yet very indifferent at boarding. But with all these objections they are still formidable ; and require in case of necessity to be met on equal terms ; ships to ships, if we would support our name for naval superiority, and mightier powers against mightier powers, if we would maintain our own station amongst kingdoms.

The objection to the new system rests

chiefly with the prejudices of those who succeeded by the old one, and the consequent support given to these by their friends, the influential supporters of the actual Admiralty and its Lords. We trust the commission instituted of late will inquire into this branch of the subject closely, or we may wake from our present supineness to find our power departed, our dominion of the ocean given to another, while we have been sleeping so long.

PHOTOGENIC DRAWINGS.

PUBLIC attention has been called of late to a mode of drawing said to have been invented at Paris by M. Daguerre, and by which he fixes upon a metallic plate the lights and shadows of a landscape or figure solely by the action of the solar light. The interest thus excited has been increased by the publication of a series of experiments made by our countryman Mr. Talbot, directed towards the same object, and producing nearly similar results. In describing this interesting invention it will be well to commence with the first discoveries made by Mr. Wedgwood about the year 1800, and afterwards extended by Sir Humphry Davy.

The attention of these two eminent chemists was directed to the subject by the extraordinary effect produced by light upon the nitrate of silver, which led them to hope that the purposes of the artist might be assisted by the susceptibility of the metallic oxide. The first experiment was made by Mr. Wedgwood for the purpose of copying paintings upon glass, and was eminently successful ; the copy obtained possessing all the figures of the original, in their native shades and colours ; it was also in a high degree permanent, so long as it was preserved from the action of the light. The same gentleman discovered that the shadow of an opaque object thrown upon the paper was copied in outline with great correctness ; but though both these celebrated chemists were constant and persevering in their endeavours to render the drawing permanent, they were entirely unsuccessful ;

the lighter shades darkening by exposure and thus obliterating the impression.

Their failure in this important object was published with their experiments in the *Philosophical Transactions*, and both having given up the attempt, their discoveries have since remained unimproved. But in the meanwhile M. Daguerre, it appears, struck by some hints he had received from a friend, has steadily pursued his experiments for the last twenty years, and having at length attained his object has declared his discoveries and claimed the invention as his own. Full and satisfactory descriptions are promised by M. Arago and two other scientific engineers appointed to report on the subject, and in the interval a slight outline has been given in the French papers, from which the following account is taken.

A polished metallic plate is the substance made use of, and being placed within the apparatus is in a few minutes removed and finished by a slight mechanical operation. The sketch thus produced is in appearance something similar to aquatint, but greatly superior in delicacy ; and such is the extraordinary precision of the detail that the most powerful microscope serves but to display the perfection of the copy. The first efforts of the inventor were directed towards architectural subjects, and a view of the Louvre and Notre Dame are among the most admired of these engravings. In foliage he is less successful, the constant motion in the leaves rendering his landscape confused and unmeaning ; and the same

objection necessarily applies to all moving objects, which can never be properly delineated without the aid of memory. But in the execution of any stationary subject, buildings, statues, flowers, the leaves of plants, or the bodies of animals, the fac-simile is perfect; and the value of the invention may therefore be easily conceived.

Several eminent artists have examined the designs, and were equally delighted with the precision and delicacy of the representation. Among the sketches exhibited by the projector was a marble bas-relief and a plaster imitation; the first glance was sufficient to detect the difference between these two; and in three views of a monument taken in the morning, noon, and evening, the spectators easily distinguished the hours at which they were executed, by the difference of the light, though in the first and last instances, the sun was at an equal altitude.

But perhaps the anatomist or zoologist will derive the greatest advantages from the discovery, the form of the animal being as easily studied from the drawing as from the original, and the most powerful microscopes not having hitherto detected the smallest deficiency in the details. Nor is the invention devoid of interest to the astronomer, for the light of the moon is sufficient to produce the usual results, requiring only additional time for its operations. The following extract from "*Le Commerce*" is sufficient to substantiate its value in this respect:—"The experiments on the light of Sirius have confirmed the testimony of natural philosophy, and abundantly proved that the stars are bodies of the same nature as the sun; at the request of M. Biot, M. Daguerre has submitted his apparatus to the influence of the light of the moon, and has succeeded in fixing the image of that luminary. We observed that the image had a trail of light something like the tail of a comet, and we ascribed it to the movement of the body during the operation, which is of much longer duration than that by the light of the sun."

In the spring of 1834, Mr. Talbot began a series of experiments, with the hope of turning to useful account the singular susceptibility evinced by the nitrate of silver when exposed to the rays of a powerful light; but not being acquainted with the researches of former chemists on the subject, he commenced with the same disadvantages which had baffled the skill and perseverance of Sir Humphry Davy. The plan he at first proposed was, to receive a well-defined shadow upon a sheet of paper covered with a solution of nitrate of silver, by

which means the part shaded would remain white, while the surrounding portion was blackened by exposure to the light. But he was well aware that the sketch thus obtained would require to be protected from the rays of the sun, and examined only by an artificial light. He had carried these inquiries to some extent, and become possessed of several curious results before he learnt the steps which others had taken to attain the same object; and the decided terms in which Sir Humphry Davy expresses his failure might perhaps have discouraged his less experienced follower, had he not fortunately already conquered the difficulty which had destroyed the hopes of the former chemists.

Mr. Talbot continues:—"In the course of my experiments directed to that end, I have been astonished at the variety of effects which I have found produced by a very limited number of different processes when combined in various ways; and also at the length of time which sometimes elapses before the full effect of these manifests itself with certainty. For I have found that images formed in this manner, which have appeared in good preservation at the end of twelve months from their formation, have nevertheless somewhat altered during the second year." He was induced from this circumstance to watch more closely the progress of this change, fearing that in process of time all his pictures might be found to deteriorate; this, however, was not the case, and several have withstood the action of the light for more than five years.

The images obtained by this process are themselves white, but the ground is differently and agreeably coloured; and by slightly varying the proportions, and some trifling details of manipulation, any of the following colours were readily obtained:—light blue, yellow, pink, brown, black, and a dark green nearly approaching to black.

The first objects to which this process was applied were leaves and flowers, which it rendered with extraordinary fidelity, representing even the veins and minute hairs with which they were covered, and which were frequently imperceptible without the aid of a microscope. Mr. Talbot goes on to mention that the following considerations led him to conceive the possibility of discovering a preservative process. Nitrate of silver, which has become darkened by exposure to the light, is no longer the same chemical substance as before; therefore, if chemical re-agents be applied to a picture obtained in the manner already mentioned, the darkened parts will be acted upon in a different manner from those which retain

their original colour, and after such action they will probably be no longer affected by the rays of the sun, or, at all events, will have no tendency to assimilate by such exposure; and if they remain dissimilar, the picture will continue distinct, and the great difficulty be overcome.

The first trials of the inventor to destroy the susceptibility of the metallic oxide were entirely abortive; but he has at length succeeded to an extent equal to his most sanguine expectations. The paper employed by Mr. Talbot is superfine writing paper: this is dipped into a weak solution of common salt, and dried with a towel till the salt is evenly distributed over the surface: a solution of nitrate of silver is then laid over one side of the paper, and the whole is dried by the heat of the fire. It is, however, necessary to ascertain by experiment the exact degree of strength requisite in both the ingredients, for if the salt predominates, the sensibility of the paper gradually diminishes, in proportion to this excess, till the effect almost entirely disappears.

In endeavouring to remedy this evil, Mr. Talbot discovered that a renewed application of the nitrate not only obviated the difficulty, but rendered the preparation more sensitive than ever; and by a repetition of the same process the mutability of the paper will increase to such a degree, as to darken of itself without exposure to the light. This shows that the attempt has been carried too far, and the object of the experimentalist must be to approach, without attaining this condition. Having prepared the paper and taken the sketch, the next object is to render it permanent, by destroying the susceptibility of the ingredients for this purpose. Mr. Talbot tried ammonia and several other reagents with little success, till the iodide of potassium, greatly diluted, gave the desired result: this liquid, when applied to the drawing, produced an iodide of silver, a substance insensible to the action of light. This is the only method of preserving the picture in its original tints, but it requires considerable nicety, and an easier mode is sufficient for ordinary purposes. It consists in immersing the picture in a strong solution of salt, wiping off the superfluous moisture, and drying it by the heat of the fire; on exposure to the sun, the white parts become of a pale lilac, which is permanent and immovable. Numerous experiments have shown the inventor that the depth of these tints depends on the strength of the solution of salt; he also mentions that those prepared by iodide become a bright yellow under the influence of heat, and regain their original colour on cooling. Without the application of one of

these preservatives the image will disappear by the action of the sun; but if inclosed in a portfolio, will be in no danger of alteration: this, Mr. Talbot remarks, will render it extremely convenient to the traveller, who may take a copy of any object he desires, and apply the preservative at his leisure. In this respect Mr. Talbot's system is greatly superior to that of M. Daguerre, since it would be scarcely possible for a traveller to burden himself with a number of metallic plates, which in the latter process are indispensable.

An advantage of equal importance exists in the rapidity with which Mr. Talbot's pictures are executed, for which half-a-second is considered sufficient; a circumstance that gives him a better chance of success in delineating animals or foliage; and although our countryman has not thought it necessary to adorn his invention with his own name, nor to keep it a secret till he could sell it to advantage, his claim to originality is equal to M. Daguerre's, and can only be rivalled by that of Mr. Wedgwood, the real discoverer and originator of the art.

Since the publication of the above discoveries, numerous candidates have appeared in the field, all claiming the palm of originality, while philosophers of every grade and country have eagerly pursued the investigation of the subject. The first we shall notice is M. Niepce, who claims priority even over M. Daguerre; and the account he publishes, if correct, will undoubtedly determine the question in his favour. A letter from M. Bauer is the principal evidence for M. Niepce, who it appears mentioned his discovery to this gentleman in the year 1827; while on a visit at Kew, and by the advice of his friend he drew up a memoir on the subject, and caused it to be forwarded to the Royal Society. This document was, however, returned, it being contrary to the rules of the Association to receive accounts of scientific discoveries unless they detailed the process employed. M. Niepce shortly afterwards returned to France, having presented to his friend several specimens of the newly discovered art, which are still in the possession of M. Bauer. The pictures taken are of two kinds, copies from engravings, and copies from nature; the best of the former is in the possession of M. Cusset, and is considered nearly equal to those of M. Daguerre, with suitable allowance for twelve years' exposure; the specimen taken from nature is, however, by no means so successful, and is considered inferior to the earliest attempts of his countryman. There can be little doubt that the principle of both processes is precisely the same, though greatly

improved by diligent experiments, the material employed in each being a metallic plate, apparently covered with transparent varnish; but whether intended to receive or to fix the impression is not at present made public. We now come to a statement of M. Bauer which, if not founded on error, will raise the invention of Niepce far above those of both his rivals; he distinctly asserts that he possessed copies of engravings produced solely by the action of light, which were capable of being multiplied in the same manner as an ordinary copper-plate; if this be the case, the greatest secret still remains unknown, even to M. Daguerre himself. It is much to be regretted that M. Niepce did not at once publish his extraordinary discovery, with a full detail of the process employed, as he would then have retained the indisputable right to the merit of the invention, but having preserved the secret so long, and the process being in every respect so different, we cannot see that it in any way interferes with the position of Mr. Talbot.

We must leave this question and now proceed to analyze the claims of two of our countrymen, Messrs. Havell and Wellmore, who are said to have introduced an important addition to the process pursued by Mr. Talbot, a full description of which is contained in a letter to the editor of the *Literary Gazette*. The first attempt of this gentleman was directed towards an etching, by Rembrandt, of an old man reading, and the result was a reversed fac-simile;—a negro face surmounted by locks of silver; the disappointed artist discovered that a second transfer entirely destroyed the spirit of the picture. To remedy this evil he had recourse to a new process, by which this defect was indeed removed, but the great merit of the art, namely, self-acting power, was lost. A thin plate of glass was laid on the subject to be copied, upon which the high lights were painted with a mixture of white lead and copal varnish, the proportion of varnish being increased for the darker shading of the picture. The next day Mr. Havell removed the white ground with the point of a penknife, to represent the dark etched lines of the original, and a sheet of prepared paper having been placed behind the glass and thus exposed to the light, a tolerable impression was produced; the half tints had, however, absorbed too much of the violet ray, an imperfection which was remedied by painting the parts over with black on the other side of the glass; if allowed to remain too long exposed to the sun's rays the middle tints became too dark and destroyed the effect of the sketch; about ten

minutes in a powerful sun was considered sufficient. Another method employed by Mr. Havell was to spread a ground composed of white lead, sugar of lead, and copal varnish, over a plate of glass, and having transferred a pencil drawing in the usual manner, to work it out with the etching point till it bore the appearance of a spirited ink drawing, or in the hands of an engraver a highly finished engraving. The above process Mr. Havell made public under the impression that it had been hitherto overlooked, but Mr. Talbot, hearing that he was about to apply for a patent, laid claim to the improvement as his own, and not only pointed out some parts of his former memorial where it was distinctly mentioned, but also produced several drawings made precisely in the manner described; he has also laid before the Royal Society a new method of preparing the sensitive paper, which consists in immersing it in a solution of nitrate of silver, and after washing it with bromide of potassium, the nitrate of silver is again applied, the preparation being dried by the fire between each operation; the paper thus treated is extremely sensitive, changing with the feeblest daylight, first to a bluish green, then to olive green, and finally to black.

A letter to Mr. Talbot from his friend M. Biot has also been published, and contains many interesting experiments. After commenting on the value of the discovery, he continues—"The interest with which I viewed this circumstance engaged me to make some experiments upon your preparation, in order to vary its application to the researches in which I am occupied. First—I wished to know whether the change of colour was in any degree influenced by the paper itself; I therefore spread the substance on a piece of white unglazed porcelain instead of paper, taking care to operate by night, and drying it each time at the fire, as you say, I thus obtained a dry solid coating upon the porcelain, which I shut up in a dark place until the morning. In the morning I took it out, and found it of a pale sulphur yellow colour: I then presented it to the daylight at an open window looking north; the weather was then very cloudy; yet no sooner had I so presented it than already it was turned green, and soon afterwards it became black. I then wished to know whether the preparation would succeed equally well if not dried at the fire; I therefore, in a darkened room, mixed the aqueous solution of bromide of potassium with that of nitrate of silver; a precipitate fell, which I spread on a porcelain plate and left it to dry in the dark; the next day I wrapped it in

several folds of paper, and brought it into another room to show it to a friend; but having taken off the covers in a dark corner of the room in order to exhibit the original colour, pale lemon yellow; instantly we saw its tint become green, and I had hardly time to present it to a window opening to the north before its colour had passed to dark olive green, after which it almost immediately became nearly black. I do not think it possible to find any substance more sensitive to light." Had M. Daguerre or M. Niepce published their experiments at the commencement, Mr. Talbot would have appear-

ed merely as an improver of a foreign discovery.

We must notice here that, by possibility, this art may not be altogether unknown to jugglers in India. It is many years since an offer was made, in our presence, by one of them, to show any gentleman his portrait taken by a single look alone. The master of the house, however, deeming the proposal an insult on the credulity of the company, ordered the man of science to be instantly expelled with the rattan.

MUSIC ABROAD AND AT HOME.

PETERSBURGH.—The musical mania is beginning to establish itself in the capital of the great autocrat. A well-written treatise on Counterpoint (in French) by M. Valville, has appeared, and is worth the student's perusal. There is a school for the education of actresses and dancers; they are obliged to serve government for ten years; they may then withdraw upon half their salary, or after twenty years' service, retire upon the whole sum they have received during their servitude. Marcellos' Psalms are translated into the Russian language: some sheets of this work were transmitted to that composer during his life-time—they are now in the Imperial Library. The musical instruments most in use throughout Russia are the harp, kettle drum, hunting horn, and bagpipe. The nuns perform their canonical prayers night and day. They suffer no instrumental music in their churches, for they maintain that the Deity can only be praised with the human voice. Miss Clara Novello has been performing at Concerts here lately—she is now on her way to Italy. Thalberg is expected here very shortly to give Concerts.

PARIS.—The Academie Royale de Musique, now the favourite resort of the dilettanti—and for which place Meyerbeer is finishing an Opera partly composed by his friend and fellow pupil Weber—is regulated by particular laws passed in January, 1791,

by which it is enacted that the works of living authors cannot be represented in any theatre in that kingdom without their formal consent in writing. The profits of author and composer for each representation are fixed at

250 francs for the first fifty representations;

100 ditto for every succeeding one, up to any amount.

For an Opera, in one or two acts, the rights of authors of the book and music are fixed for each,—

170 francs for the first fifty representations;

50 ditto for every one afterwards.

(See *Thackeray on Theatrical Emancipation*.)

M. Berlioz produced at a Concert his two symphonies, "L'Event de ma Vie," and "Harold," played by the superb band of the Conservatoire; at which, it is said, Paganini was so delighted, that besides offering homage to the composer on bended knee in the orchestra, he afterwards sent M. Berlioz a note for 20,000 francs. Donizetti, the composer, has settled in Paris; he is engaged upon two new operas, having already written sixty. The Library of the Conservatoire de Musique has been restored under the direction of M. Debret; its fine collection of musical literature and music is open to the pub-

lic from ten in the morning until three in the afternoon. M. Halèvy has written and brought out a new opera, entitled "*Guido et Ginevra*," or "*The Plague in Florence*." It has much merit, and was successful. The pianoforte score is published at Leipzig. A society has lately been formed called "*La Nouvelle Société Musicale*," by which the directors (some of the chief musical men in Paris) propose to effect the same wholesome revolution in chamber music as has already been produced at the Conservatoire in orchestral music. Rossini has been for some time engaged in the composition of a new opera—the subject an Oriental story. M. Nourrit, the celebrated tenor, who was a pupil of Garcia, and who originally made his debut in Gluck's "*Iphigénie en Tauride*," committed suicide at Naples after singing in Mercadante's opera *Il Giuramento*. He had never recovered the painful sensation inflicted on his mind by the arrival of Duprez, the present favourite tenor, and had long been in a desponding state. To prove the esteem in which this justly celebrated artiste was held by his brother professors, the Académie Royale was closed the moment the painful news arrived there. Those who witnessed Nourrit's performance in *Robert le Diable* will equally regret the cause and manner of this lamented performer's decease.

BRUSSELS.—A company is forming here, who intend to establish a theatre in the suburbs for the performance of music of the three schools, (viz. Italian, German, and French.) The regulations of this society are made public. A work in two volumes, entitled "*Madame Malibran, par la Comtesse Merlin*," has just appeared.

VIENNA.—Lindpaintner's new opera "*Die Genueserin*," has been performed under the direction of the composer. He is a musician of great talent. There is remarkable spirit and tact in all the compositions we have inspected by this master—they are but slowly making their way in England. A work on the music of the modern Greeks ("*Ueber die Musik der neuern Griechen, nebst freien Gedanken über altegyptische und altgriechische Musik*") is just published, from the pen of R. G. Kiesewetter, well known for his able researches on this abstruse subject. The *Allgemeiner Musikalischer Anzeiger*, for 1839, 52 Nos. 8vo. is printed in this city.

LEIPZIG.—Auber's latest opera, entitled "*Die Schwester der Feen*," (The Sister of the Fairies) has just appeared, published by Breitkopf and Härtel. A new work upon

the Physiology of the Human Voice, by Giacomo Bisozzi (*Die Menschliche Stimme und ihr Gebrauch für Sänger und Sängerinnen*) published by Engelmann, is announced. Dr. Fink, editor of the *Allgemeine Musikalische Zeitung*, has printed his work upon the progress of the opera ("*Wesen und Geschichte der Oper*."). It is well worth the perusal of all who study the musical portion of the histrionic art.

BERLIN.—A concert was given in the Hall of the King's Theatre by M. Möser, in order to introduce his son, August Möser, a boy of twelve years of age, whose performances on the violin were the admiration of the company. He has a confidence and execution for his years which promises that he will become a virtuoso on the violin. In his execution of the "*Tremolo*," in Beriot's compositions, he excited the greatest surprise. He was supported by Misses Lowe and Schultz, Mr. Mantius, Mr. Seydelmann, and the flutist Gabrielsky.

SALZBURG.—In one of the principal streets of this town, nearly opposite to the University Church, is the house in which Mozart was born in 1756. Neither bust, inscription, or any other memorial of this great artist, draws the eye of the passenger upon it. Mrs. Trollope, in her "*Vienna and the Austrians*," mentions a visit she paid to the tomb of Haydn (*Michael Haydn*, as she calls him.) His body is buried at the foot of the steps leading up from St. Rupert's little cathedral to the chapel and cell of St. Maximus: his head, enclosed in a black marble urn, is placed on a monument erected to him in the neighbouring church of the Benedictines. The memorial to Mozart, cast in bronze, will be erected next spring in an open piece of ground in this city.

DRESDEN.—Thalberg has lately sojourned in this place, giving concerts and astonishing the virtuosi there with his wonderful powers on the pianoforte. Even those learned persons are struck with the gigantic attainments of this rising musical luminary, for he has not yet half accomplished his improvement upon the great style of pianoforte composition. He has now left for St. Petersburg.

DARMSTADT.—A new opera called "*Leben ein Traum*," or "*Life a Dream*," has appeared here, written by Steppes (founded upon a story by Calderon) the music composed by Concert-master Schlosser, of which report speaks favourably.

CARLSRUHE.—A work has just appeared in two volumes, by Dr. J. S. Gassner, entitled "The Science of Scoring," or leading points for self-instruction to young composers. *Partitur-Kenntniss, Leitfaden zum Selbstunterricht, für angehende Tonsetzer, &c.* A work of this description is greatly desired by the numerous class of rising composers.

GENOA.—The Stagione Theatre was opened with a new opera by Costamagna. The libretto, by Rovani, is considered among the better order of such productions; in which very great reforms are now required, for the quantity of nonsense given to the world under that imposing name can hardly be imagined by those unacquainted with such matters. The writers of real talent seem most unaccountably to shrink from an occupation that Metastasio has ennobled.

ROME.—Spontini has been invested by the Pope with the order of St. Gregory. The Holy Father complained to this distinguished composer, that church music in Italy was very much on the decline (and every other species with safety he might have added,) he wished Spontini to consult with the Cardinal Secretary of State, as to the means of infusing a new spirit into its expiring energies. It will be a curious coincidence, if the modern writer succeeds in restoring, what in former days Palestrina (under another pope) was employed to reanimate, for similar reasons. John Cramer is now sojourning in this city.

VENICE.—The new opera by Vaccaj, "The Bride of Messina," Libretto, by J. Cabianca, is a plot full of absurdities; has few points in the music to recompense so feeble a production of this poet, from whom something better was expected.

MILAN.—A reward of 50 Fredericks d'or, (£44 10s.) has been offered for the best design for a theatre, to be erected in Wismar. Designs to be forwarded before the 1st of May.

NAPLES.—The first number of a work containing an account of the Musical transactions throughout Italy, "*La Gazzetta Musicale*," has appeared. The plan of this publication seems well arranged.

PAVIA.—The story of "Manfred" has been set as an opera by Perelli, and succeeded.

TRIESTE.—Miss Kemble continues to be the prima donna at the Teatro Grande; she

is nightly received with enthusiasm and showers of flowers.

CONSTANTINOPLE.—A plan of founding a theatre in the environs of this city is very likely to be completed. The intention is to bring out Italian and French operas. Donizetti's brother is director of music to the Sultan. The Italian company from Odessa performed the opera of "*La Straniera*" of Bellini, and "*L'Italiani in Algeri*," before the Sultan, at which he seemed highly delighted. We strongly recommend M. Donizetti to search for genuine Eastern Melodies, so as to found something like a national opera in this musically civilized capital.

CALCUTTA.—"A Treatise on Arabian Music," by Abdallah ben Khaledun, translated by J. G. Jackson, Esq., has been advertised for some time; considering it as a musical curiosity, it has been ordered, but no copy as yet has reached England.

LONDON.—The Opera and Concert Season has just commenced. At the former establishment, Grisi, and her relative, Sig. E. Grisi, Rubini, Lablache, with Taglioni, Guerra, as ballet master. &c., are to appear. M. Laporte intends bringing out "*Guillaume Tell*," with the above named artistes as principals; this will be a great musical attraction; for the lighter operas, he advertises Coppola's "*Nina*," Donizetti's "*Belisario*," and others of that class, which must depend for success entirely upon the great talents of the singers. Barnett's opera of "*Farinelli*," brought out lately at Drury Lane, is extremely clever music, scored with a masterly hand, and is just such a work as the musician must be pleased with. The plot is very feeble, and will not bear comparison with his *Mountain Sylph*. Rooke's new opera, which will soon be brought out at Covent Garden, introduces a new tenor singer to the stage, a Mr. Harrison. Some of the solos, one for Phillips especially, are full of melody. Under the very able management of Macready, this theatre is in a prosperous state. The Lyceum or English Opera House opens on the 1st inst; the talent engaged and the care of the lessee, will, we are confident, insure success—among the novelties advertised, we particularly notice a musical comedy! The "*band à la Musard*" have removed to the Adelphi. The St. James's Theatre has passed into other hands: as far as a variety of entertainment can please the public, the utmost is effected by the present management for that purpose. The Haymarket opened with a powerful company the latter end of March. A long list of novelties are in active

preparation. Mori's and Lindley's Classical Concerts; Moscheles' Matinées Musicales; Blagrove and Dando's Quartett Concerts, the Concerts à la Musard* at the English Opera House. Those projected at the Colosseum upon the same plan, together with the Ancient, Philharmonic and Societa Armonica, are all in full activity. It is said that Mendelssohn and Spohr are coming over to the Philharmonic this season, the latter bringing with him a new symphony in C. minor he has just completed. Would it were possible the directors might see the necessity of engaging as effective a vocal choir as they have a splendid band. Against their mighty symphonies, isolated songs and duets have nearly as poor an effect as miniatures hung up in a gallery of historical paintings. The members of this society are rich and powerful, why should not this concert be the first and most perfect in England? Will not the hint of so many subscribers leaving, cause some reform in this respect.

The proposed establishment of a German opera, to be conducted by the Chev. Spontini, appears not to have been effected, as he requires a certain subscription to insure his company against loss. During his stay in

* The rage for these instrumental promenade concerts has extended itself over the city; in many young men the charm has wrought a vast change, the billiard-room and divan are now neglected (the house has been nightly filled to the ceiling,) a new taste has sprung up among the junior merchants, and the result is the establishment of similar entertainments in all directions.

England, Spontini was actively engaged in gathering materials for his new opera "Oliver Cromwell," which he is now completing.

Among the musical works published lately, we may notice the pianoforte studies of Henselt, in which "The Love Song," "The Romanza," and "Ave Maria," are evident proofs this young professor possesses great musical fancy and feeling. He is to visit London this season. Chappell's collection of English Melodies, arranged by Dr. Crotch and others, seems likely to become popular. A set of glees, &c., by a rising English composer (James M'Murdie, Mus. Bac. Oxon.) are in the press. There is very great talent in this work. One from Ossian, "By the Dark Rolling Waters," à la Calicot, is both imaginative and effective; the composer is a musician of the genuine school.

The festivals projected this year, are the Liverpool, Norwich, and Oxford, besides the meeting of the three Choirs at Worcester.

Musical Works published on the Continent since our last Number.

Fétis, F. J., Biographie universelle des Musiciens et Bibliographie générale de la Musique. 8vo. Bruxelles. 10s. 6d.

Griepenkerl, W. R., Das Musikfest, oder die Beethovener. 12mo. Leipzig. 7s. 6d.

Mainzer, Esquisses musicales et souvenirs de voyage. Vol. I. 8vo. Paris. 4s. 6d.

Nicolai, G., Der Musikfeind. Ein Nachstück. Second edit. 8vo. Leipz. 6s.

Schilling, G., Allgemeine Generalbasslehre, min besonderer Rücksicht auf angehende Musiker und gebildete Dilettanten. 8vo. Darmstadt. 13s. 6d.

MISCELLANEOUS LITERARY NOTICES.

FRANCE.

At a recent sale in Paris, several original autographs were disposed of. Boileau's realized 170 francs, Fenelon's 110 f., La Fontaine's 320 f., Racine's 175 f.; and for Tasso's 400 francs were paid.

In the year 1790 France had 118 bishops, 18 archbishops, 37,000 vicars, 20,000 curates, 3600 prebends, 5500 canons, 18,000 monks, and 36,000 nuns, altogether nearly 115,000, for whose support 170 million of francs were not found sufficient. In 1837 France had 3301 vicars, of whom 2527 had each 1200 f. annually, and 774 received 1500 f.; 25,360 curates, among whom were 22,680 that received only 800 francs per annum, being under 60 years of age, and the remainder (2680) received 1000 francs.

Braconnier has propounded a curious doctrine in his work, "Essais sur la Langue Française," respecting the genders of nouns. He says nature has pointed out the distinction between the masculine and the feminine. Man, the lord of the earth, his greatness, strength, and power, and whatever regards his character in these particulars, must be in the masculine; while on the contrary, whatever denotes or assimilates to weakness—the want of power—must be in the feminine. Thus he instances *le fleuve* and *la source*. He also produces several examples in support of his theory, where poets and the best prose writers have used one and the same term, sometimes in the masculine, and at others in the feminine. He further expresses the absurd wish that every exertion should be made to extinguish the neuter from all languages, the figurative style being the most beautiful and perfect.

PARIS.—Scriptorum Græcorum Bibliotheca.—The new volume (the third) of this collection contains Xenophon, Greek and Latin, with indexes; edited by L. Dindorf. The Latin translation is collated from Hutchinson, Edwards, and Leon Clavius. The first

two volumes contain Homer and Aristophanes, beautifully printed by F. Didot.

The "Voluspa," "Vafthrudnismal," and "Lokasenna," from Saemund's poem of Edda, have been republished in Icelandic, with French translation and Glossary by Bergman, at Paris.

Two lives of Napoleon, on the same plan, are now publishing at Paris; the first by Laurent, with the beautiful drawings of Horace Vernet, and another by Norvins, whose historical talent is so well known, with illustrations by Raffet. Both are of the same size and price, and have met with nearly the same success.

The first edition of C. Delavigne's new play, *La Popularité*, has been purchased, it is asserted, for 8,000 francs, by M. Delloye, the publisher.

Dominique Mondo has translated Dr. Lichtenhal's 'Dizionario de Musica' into French; the work will very shortly appear.

M. Garcin de Tassy will publish in the course of a month the first volume of his "Histoire de la littérature Hindoustani." Report speaks most highly of the talent and research displayed in this work, and which promises to add even to the high reputation of its distinguished author.

M. de Tassy intends visiting soon, in order to perfect a work he has in hand upon Eastern Coins.

The Asiatic Society of Paris has elected Mrs. Davids, the talented mother of the lamented Arthur Lumley Davids, a member of their association. This is the third lady so distinguished; the two others being the Princess Bogoloso, and the Comtesse Victorine de Chastenay.

ITALY.

Professor G. Jan in Parma is engaged on a translation of Shakspeare's works into Italian, under the title—"Opere di Shaks."

peare, nuova versione italiana, &c." The forwarded specimen leaves, from the Merchant of Venice, and Romeo and Juliet, are sufficient proofs of the talent and care of the translator. He has commenced with King Lear, which will be printed at Zurich, in three months; and a drama in 8vo. will appear every quarter of a year, accompanied with the English version, and the notes will be published separately at the end of every year. The original verses will be retained in metre.

A learned Italian, Manzano, in searching through the archives of Bologna, has discovered that the celebrated Maid of Orleans was descended from the race of the Ghislieri, and was the daughter of Ferrante Ghislieri, who fled from his country in 1401, when Giovanni Bentivoglio usurped the sovereignty of Bologna.

ROME.—The latest production of the arts in this city is a beautiful painting of the Good Samaritan, by a talented young Spaniard, Lorenzale, who, with Mr. Ward, an Englishman, have been each awarded the silver medal prizes of the Academy of San Luca.

Dr. H. Schulz, of Dresden, who has been staying for a considerable time in Rome, is about publishing the History of the Arts of Southern Italy, from the earliest period to the sixteenth century. It will be complete in three volumes folio, and illustrated with 120 engravings on copper. The drawings consist of many highly interesting Byzantine architectural monuments of Puglia, and are beautifully executed by Hallmann, a Hanoverian; those of Sicily are by Cavallari, and are of a masterly style.

GERMANY.

A new edition of Tieck and Schlegel's Shakspeare's works has been announced at Berlin to appear in a smaller and cheaper form in 12mo volumes, uniform with the new edition of Schiller's works.

Dr. Förster is lecturing at the Munich museum upon the arts during the middle ages, to very numerous assemblies.

In the year 1758 the Emperor Francis I. of Germany held a grand hunt on the estate of Prince Colloredo in Bohemia; the number of hunters was twenty-three, including three ladies, and it continued eighteen days. 47,950 heads of game were killed, consisting of 19 deer, 77 roes, 10 foxes, 18,243 hares, 19,545 partridges, 9499 pheasants, 114 larks, 353 quails, &c., &c. The emperor had 9789 shots, and the Princess Charlotte, his sister, 9010. The total number of shots fired was 116,209.

The Iliad of Homer has been lately translated in the Sanscrit.

The railroad from Leipzig to Dresden will be completed by the 15th April, for the Leipzig fair, with the exception of the Oberauer Tunnel.

DRESDEN.—Prince Johann of Saxony is about to publish a second edition of his

translation of Dante's Divina Comedia; the first part, "Inferno," will shortly appear, with a beautiful frontispiece by M. Retzsch.

Retzsch has finished the first six plates of his Outlines to Burger's Leonore, but they will not be published till he has completed the series that is intended to illustrate this poem. Those already etched are beautiful, and promise a great gratification to his friends in England, where we are persuaded it will be as much liked as his "Song of the Bell," and the Outlines to other German poems.

HAMBURG.—The second edition of Neander's Life of Christ has already been exhausted, and a new edition is expected in a few days.

Professor Marbach of Leipzig is publishing a series of "Volksbucher," or a reprint of the popular tales and histories which were published for the amusement of the lower classes about a century ago. Among those that are already published are Tyll Eulenspiegel, die Heymons Kinder, der gehörnte Siegfried, Genoveva, and many more.

The coronation at Milan has given an opportunity to many German publishers to speculate in coronation albums and such like. The best of any that we have seen is a description of the ceremony, the processions, parades, &c., by August Lewald, in 4to, with several plates and vignettes; published at Carlsruhe.

The second volume of Count Raczyński's "Histoire de l'Art Moderne en Allemagne" will shortly appear at Berlin.

Dr. Biernatzki, whose former religious novels have been so favourably received in Germany, and also translated into Dutch, Danish, Swedish and French, and we believe into English, has just published a new one under the title of "Der Braune Knabe, oder die Gemeinde in der Zerstreuung."

The volume of Miracle Plays mentioned in our last number is merely a reprint of the following plays: The Deluge and Antichrist, from the Chester series; Joseph's Jealousy, the Trial of Joseph and Mary, and the Pageant of the Company of Shearmen and Tailors, from the Coventry series; Pharaoh, Pastores, Crucifixio, Extractio animarum ab inferno, Juditium, from the Townley series. Prefixed is an historical view of the English Miracle Plays by Dr. William Marriott, and appended two plays of a later date—Candlemas Day and God's Promises.

The "Freihafen," a new quarterly belletrist journal, continues also for 1839. The first number has papers by Chamisso, Carus, Varnhagen von Ense, Mundt, and others; the former numbers had papers by Dr. Strauss, Prince Puckler, and other fashionable authors.

The new number of the "Deutsche Viertel-Jahrsschrift" contains papers on the Journals in Germany—on the German Population—and Manners of the Americans;—Scientific and Spiritual Life in Italy—The

Bogota Table-Land, by Baron von Humboldt;—The Foreign Commerce of France, particularly with Germany, and many smaller notices, &c.

The "Conversationslexicon der Gegenwart" is appearing in rapid succession; the last number brings it to the letter E.

The new edition of Herder's *Cid*, with border drawings and illustrations by Eugen Neureuther, already so well known and estimated in this country, has at last appeared; the engravings are executed by the first English wood-cutters, and the book is a worthy companion to the many other illustrated works lately published on the continent.

A new translation of Cicero's works into German is announced. The principal contributors are Von Strombeck, Fr. Jacobs, Droysen, A. W. Zumpt, A. Westermann, and Dr. Klotz the editor. It will be published in about eight volumes.

Dr. Bretschneider of Halle has published a little novel, founded upon the abuse the Pope has lately made of the mixed marriages in Rhenish Prussia. It met with great success, and an edition was sold in a few days.

Several artists at Munich have united to bring out a series of plates in lithography, in the tinted manner of some of our lithographers. The subject they have chosen is the illustration of the Tyrol.

Eugene Neureuther, the artist that pub-

SAVINGS' BANKS.		FLORINS.	
Austrian States, including Italy	8	with	30,325,993
Prussian do. (Posen has none)	80	"	9,544,296
Independent States of Germany	201	"	23,920,736
Switzerland	58	"	7,891,353
Belgium	5	"	6,466,365
Holland	50	"	2,771,608
Duchy of Sleswig	22	"	300,000
France	250	"	49,777,423
British Islands	484	"	362,847,622
Independent Italian States	2	"	1,500,000

Total number of banks, 1,160; total florins, 495,347,796.

The heads of the Rhine and the Danube approach near each other by nature, and their artificial junction has been already accomplished. The consequence will therefore arise that the northern states must consent to a fair and open trade by the Rhine, or submit to an illicit trade by its new competitor—the Danube.

The following account of the circulation of the Vienna journals is taken from the *Nuremberg Correspondent*: Official Gazette, 2,600; Austrian Observer, 600; The Eagle, 270; Theatrical Gazette, 1,300; Humourist, 450; Vienna Journal, 600; Spectator, 750. A commercial journal, the Shareholder, is to appear next year, as well as a literary paper in French.

10,000,000 volumes are printed in Germany and 50,000 authors (annually.)

The subscription for the intended Thorwaldsen Museum at Copenhagen, not having amounted to a sufficient sum for erect-

lished the border-drawings to Göthe's ballads and other German poets, is about to publish a portfolio of his etchings, which we have no doubt will be welcome to many of his admirers in this country.

MUNICH.—The beautiful MS. in the library of this town containing the Polyglot Lord's Prayer, with the border-drawings by Albert Dürer, is about to be published by Cotta in close imitation of the original, by coloured lithography. The title will be—"Oratio Dominica Polyglotta singularum linguarum characteribus expressa, et delineationibus Alberti Düreri cincta, edita a F. X. Hoeger, &c." The size is folio, and the price, we expect, will be about twenty to twenty-five florins.

GREIFSWALD.—Professor Schoemann of this university will shortly publish an edition of two of the biographies of Plutarch, with a Latin Commentary and Preface. The text is collated from the Codex at Paris, and various readings have been advised from the libraries of Heidelberg, Göttingen, &c.

A new edition of Plato is now publishing at Zurich in parts, edited by Baier, Orell, and Winkelmann; it will form one large volume, and will be completed early in the year 1840.

M. Malchus, a German political economist, has published the following comparison of the working of the savings' banks in different countries of Europe at the end of 1837.

ing an edifice worthy of its objects, the king has appropriated to this purpose the wing of the new palace at Christiansberg, which stands between the chapel and the menage. Thorwaldsen is already busily employed in arranging this building for its new destination, and, as soon as this task is finished, intends to return to Rome.

TURKEY.

Dr. Loewe is now returning from his Egyptian and Oriental tour, through Greece and Italy. He was most kindly received at Constantinople by Lord and Lady Ponsonby, and his presence in that capital created great sensation among the learned. The sultan showed the young savant every mark of attention and favour, and employed him to translate the hieroglyphics of an obelisk. Dr. Loewe is rich in Oriental MSS. and promises a Nubian, among other grammars. We grieve to learn that this

enterprising scholar was robbed by the Druses, at Zefed, of property to the amount of £400.

CONSTANTINOPLE. — The all-engrossing topic of conversation here is the erection of the new Opera and the proceedings at the provisional theatre, a large hotel having been fitted up for that purpose near the *Almeidan* square. This house is nightly filled, notwithstanding the high charges for admission, viz. from 2 to 10 piastres, 8s. to 2l. The Turks, who are naturally very early people, retiring to rest at the same time as the fowls, take such an interest in the musical entertainments that they sit contentedly until the termination, which is generally near midnight.

ARABIA.

Earl Munster is, we understand, preparing for the press some interesting military annals from the Arabic.

EGYPT.

We earnestly recommend to our readers the subscription for assisting the Rev. W. Tattam's object of obtaining Coptic MSS. of the Bible, &c. in Egypt and the East, whither this distinguished scholar has repaired, at considerable inconvenience and sacrifice, for this important object, the utility of which can be doubted only by the grossest ignorance. We have been surprised to see some silly attacks on the project, in letters to the *Times* and *Literary Gazette*, inserted by the good-natured sufferance and impartiality of those two valuable journals: especially as in the former instance the display of learning made by the writer, though not its perversion, was taken without acknowledgment from the really learned and profound, but unpretending, pages of Mr. Williams' Essay on Hieroglyphics.

We have been favoured with a sight of a MS. letter from the Pasha of Egypt to an English lady, which, as it is somewhat of a literary curiosity, we have had translated for our columns. The letter is addressed to Mrs. Davids, mother of the talented Lumley Davids, whose premature death will long be deplored by the literary and scientific world. It is the *third* royal letter

received by that lady, deploring the loss of her highly-gifted son (the first being from Mahmoud the Second, with a diamond ring, the second from Louis Philippe, with a cup). — The contents of the letter are as follows:—

"Dignified, intelligent, estimable Mrs. Davids, the manifestor of sincere friendship, his Excellency my friend Col. Campbell, of high rank and dignity, established at Alexandria as Consul-General for the illustrious government of England, has sent to me an excellent work, giving instructions how to translate from English into Turkish, and from Turkish into English, a surprising proof of the ability of its author, who had thus, while almost yet in his infancy, made himself acquainted with all the niceties of grammatical science. I read the book with great pleasure, and learn from it that its estimable author, after having reached the extremity of perfection here, hath ascended to Heaven. That he should have left such a testimony of his progress in solid sciences and successful attempts at attaining perfection, though it increases our regret for his loss, must be a source of consolation and exultation to you. If, by the blessing of the most High, this sheet should reach you, it will be an evidence to you of my sincere regard."

Mohamed Ali, 1229.

21 Jumádé 1 ewerel, 1254.

10th August, 1838.

MISCELLANEOUS.

A new translation of Goethe's *Faust* by Jonathan Birch, Esq. is in the press, and will speedily appear with the illustrations of M. Retzsch, but in a smaller and more convenient size.

The Golden Eagle.—The stamping of this superb coin has commenced at the mint of Philadelphia: it is 34 years since any of this coin was struck, the coinage ceasing in 1804, because the erroneous standard of our gold caused it to be exported.

According to recent calculations, which we find in the Stockholm papers, the actual population of Sweden amounts to 3,025,140 souls, showing an increase of one-fifth since his present majesty was called to the throne.

LIST OF THE PRINCIPAL NEW WORKS

PUBLISHED ON THE CONTINENT.

FROM JANUARY TO MARCH, 1839, INCLUSIVE.

5. Ἡφαίστιωνος ἐνχειρίδιον περὶ μετρῶν καὶ ποιημάτων. (Manual of Greek Metres by Hephaestion.) Curante Thomâ GAISFORD, A. M. Editio nova et auctior. Leipzig. 1832.*

ARISTOTLE, whose works are a mine of practical wisdom, in his Nicomachian Ethics, makes the remark that the best and shortest way to understand moral science is to be a good man : for, if we begin by a living experience of the *what*, the *how* and *why* will follow of themselves, and the facts of our moral existence will by degrees assume a scientific shape in the natural workings of a speculative mind. Ἀρχὴ γὰρ τοῦ ὅτι καὶ εἰ τοῦτο φαίνεται ἀρκούντως, οὐδὲν προσδεῖται τοῦ ΔΙΟΤΙ. . . . So also Quintilian, in the same tone of high moral health, will not allow that even an or-

ator can be formed out of any other materials than those which virtue supplies. "Orator perfectus nisi vir bonus esse non potest." So sound and sensible are these ancients in all ethical matters, that even a doctor of theology could not speak more properly. Arts and sciences, with all their pride and parade, are viewed as merely the outward limbs and flourishes of an inward soul ; ramifications growing out from a substantial and abiding nucleus of humanity, the essence of which is expressed in these significant words—a good man. And what is this, other than what we are taught in that most pregnant passage of the Gospel of St. John, "If ye do my will ye shall know of the doctrine." Faith and philosophy, which sometimes seem made only to quarrel, agree here ; they both teach one and the same great truth ; which when reduced to its most general scheme (for it is by no means confined to ethics) may be expressed thus—all knowledge of things within us, and therefore most peculiarly human, presupposes a living experience of the thing attempted to be known ; all science of human emotions, or of the acts that are the expression of these emotions, can only proceed out of the fruitful soil of a soul which has been deeply stirred by these emotions ; a man must be the thing before he can know it.

Take an example. A small critic of the old French school attempts to measure Wordsworth. What is the consequence ? He finds every thing out of joint, and disproportionate. Nothing will please him, not even the Excursion. This poem is ludicrous, and that is puerile : one expression is too mysti-

* *The Original Rhythmical Grammar of the English Language ; or the Art of Reading and Speaking on the Principles of the Music of Speech*. By the Rev. JAMES CHAPMAN, Teacher of the Science and Practice of Elocution. Edinburgh. Edinb. 1821.

cal, and another is too plain ; this is against all rule, and that "will never do." In the language of the literary world, a certain well-ordered concatenation of phrases of this description has been wont to be termed criticism : but what is the real amount of all such prate ? Were it not much wiser, and much honester, to say at once, I do not like it ; I do not understand it ; I have no eye for it ; it does not lie in my way ? Thus the course would be cleared, and every one might tramp his own journey, and find room enough and to spare. But if a neat, precise, critical understanding will thrust itself into the enchanted island of poetry, where music floats upon every cloud, and hangs upon every green tree, what is to be expected from such an untoward conjunction but confusion, and babble, and discord ? All criticism indeed of poetry, when attempted to be constructed by the mere understanding in a systematic scientific shape, is a thing impossible. There is no real criticism upon paper that assumes the square and compass, or affects the tone of dictatorship. The best things that have been said of poets have been said by those who would have as soon attempted to write a cosmogony of the universe, as to point out critically the beauties and the faults of their favourite authors ; but in the fullness of poetic love and reverence they have accidentally thrown out words, that have expressed the character of this or that great writer with more striking truth and precision than pages of most erudite criticism could have elaborated. And thus what we quoted above from Aristotle proves as true of critical science as of ethical. Have a care in the first place to be the thing you wish to know. Make sure of the *ὄρε* and the *διόρε* will follow. Be a good man, and understand ethics ; be a devout man, and understand Christianity ; be a man of love, and understand poetry.

What should a man do then, and what genus of living emotions should he have deeply experienced, in order to comprehend and make comprehensible the theory of metres ? The subject does not seem very profound. Every man who can walk knows what common time is, and every man who can waliz knows what triple time is ; but at the same time it is manifest that in the details of rhythmical science, especially when applied to a dead language, difficulties will occur ; and the Greek scholar who wishes to reconstruct the rhythmical harmony of a Pindaric ode, or an Æschylean chorus, will find that he has a task to perform that can ill dispense with the preparation of a wide and manifold musical experience. To keep time to the stable but varied march of Milton, or to thread the harmonious mazes of Thalaba,

may seem comparatively an easy thing. We are familiar with the movement of the language ; and its natural accents, even without the aid of music, form themselves into perfect rhythm to our ears. But are you quite sure even of this ? Can you read every line in Milton or Southey in such a manner as the refined musical ear of a practised elocutionist will approve ? Are you ignorant that there are periods of organ music in the divine song of Milton that have confounded our most erudite editors, and spoken no harmony to our most nice prosodians ? Or do you perhaps belong to that notable corporation of modern critics, who, with Dr. Nott at their head, believe that the best poetry is that which is submitted to the eye, and not to the ear, and whose proper habitation is not in the soul of a man, but on the desk of a student ?* Do you subscribe to that great heresy of English prosodians, which Aristoxenus, for its sheer absurdity, could not have comprehended ; viz : that there is no such thing as musical rhythm in the English language, no measure, no time, but only a regular seesaw alternation of accented and unaccented syllables ? Be this as it may ; hold with Carey or Chapman as respects the scanning of English verses ; finger syllables, or number crotchets and quavers ; there can be but one opinion with respect to Pindar and Æschylus. We know that their verses were made to be sung, and have indeed no character, no significance, no existence apart from music. Either the odes of Pindar have a musical rhythm, or they have no rhythm at all. If they have no rhythm at all, or at least none perceptible to us, as some have supposed,† then let them not be read ; for they can only serve to barbarise the ears of

* "But when the works of our poets were no longer sung or chanted, but were submitted to the eye, and read privately in the study, then the defects of the rhythmical versification were felt sensibly, and the reader found himself often encumbered with an unwieldy number of syllables which he could not dispose of but by reciting each line aloud ; a trouble few would be disposed to encounter ! !"—Nott's *Surrey and Wyatt Dissertation*, p. 181. True ; very true ! The whole philosophy of modern versification lies here ; and we see at a glance how it comes to pass that the measures of Southey are so infinitely inferior to Pope's, and Pindar's, *pari ratione*, so infinitely inferior to Southey's. Perhaps, also, one reason lies here of Porson's furious wrath against the Anapæsts *in pari sede*. But of this anon.

† "The hexameter or heroic metre of the ancient Greeks is delightful to our ears ; so is the iambic metre, fortunately, of the stage ; but the lyric metres generally, and those of Pindar, without one exception, are as utterly without meaning to us, as merely chaotic labyrinths of sound ; as Chinese music or Dutch concertos."—*De Quincey, in Tait's Magazine*, Dec. 1838. How much of this is false, and how much of it is true ; and how much of what is true is only half true, we shall inquire as we proceed.

our young men, and to occupy fruitlessly precious time that might have been consecrated to the study of Shakspeare and Milton. If they have a musical rhythm, then it can only be approached through music. To know the science of Pindaric metres, a man must, according to Aristotle's maxim, be not a musician necessarily, but at least musically cultivated; and the young Hellenist who wishes to get beyond the beggarly elements of a fingering prosody, must throw Porson, and Burney, and Gaisford behind his back for a time, and take a lesson from Dr. Crotch, or Mr. Graham.

The necessity of commencing the science of Greek metres with the practice of music has been seen and acknowledged by all thinking men who are competent to give an opinion on the subject. We happen to have before us at this moment a volume of Professor Zelter's Correspondence with Göthe (a work whose value is known to most who take any interest in musical literature), in which the following striking and characteristic passage occurs:—

“Berlin, 2d February, 1814.

“ZELTER TO GOETHE.

“Geheimrath Wolf sends you greeting. He is reading lectures on the Prometheus Bound of Æschylus, (as he says *gratis et frustra*), and has a great concourse of hearers. Some small metrical differences have separated us of late, instead of bringing us nearer together, as they ought to have done; but every thing runs smoothly again. I had been so unpolite as to tell him in his teeth without any circumlocution, that I considered his attempts, and those of all other philologists, orally to reproduce the ancient measures of the Greeks, more unmetrical than the most plain natural prose. I served him well. For after asking me to try my hand at these matters, he received my honest essays in a very ungracious manner. But these philologists are really a peculiar race. What have we to do with the Greeks and Romans if we do not understand German in the first place? What can the ancients profit us, if we do not make ancient wisdom ours?

“When these Greek and Latin gentlemen open their mouths a man should stop his ears. They cannot manage either mouth or tongue, because they have been accustomed to do every thing with their eyes. They read, they finger, they go, they stand, and become short-sighted over their desk, and lame, and dry.

“Wolf has been occupying himself much lately with the music of the alphabet; and I have many interesting conversations with him on that subject. If I could only bring him to this, that the alphabet is a work of the mouth, and metre a work of the pulse,—that is to say, a thing that must be evolved from within, and not scraped together from without,—then might the learned gentlemen

begin their theory in the right way, *vide licet*, with the practice.”*

Is not this, reader, a fine, hearty, racy old fellow? a most wise professor of song! a most sensible stone-mason! Was not this a most rare pedagogue to train the learned Frederick Augustus Wolf into a natural and healthy perception of the great principles of rhythm? Might not this man have given a useful hint or two to Porson, instructed Professor Gaisford in the philosophy of the cæsura of Anapæstic verses, and even to the overbearing, haughty intellect of Bentley made more manifest the great mystery of scansion by Trochaic dipods? And observe how very reasonable the worthy musician is in his demands. He does not say, study my craft; read crotchets and quavers; consider well the great dramatic contrast of *staccato* and *legato*; remember that there are such things as rests and empty times; do not mingle and confound the time of a jig with the time of a march; do not give to all notes equally, whether emphatic or non-emphatic, the same absolute unvaried quantity; and forget not that the close of a rhythmic period naturally demands notes of a very different value from the beginning.—Professor Zelter did not remit the eruditè Hellenist to the piano, as he might well have done, to learn the principles of rhythm; he merely told him to consult his pulse in the first place, and Hephæstion in the second; to recite Greek verses instead of reading them; to scan by his ear, and not by his eye.

But though the wise musician does not insist peremptorily on the practical study of music as a *propædeutik* to the study of metres, what he says comes virtually to the same thing. For the rhythm of music sways secretly all good recitation, and though speaking is not singing, it is nevertheless the same faculty that enables a man to play a tune in good time, and to recite verses harmoniously; and that wherein music differs from speech, is not the rhythm, but the notes; not the time, but the tune. It is possible, also, in a language so fatally divorced from musical practice as ours, that there may, on many occasions, occur a complete clash between the natural rhythm of the words, and the rhythm of the music to which they have been set. But this clashing is a thing merely relative, occasioned partly by a degenerate state both of language and music, and partly by the uneducated ear of the poet, or the reckless bungling of the mechanical musician; and whether well set to music or ill, language still has its own natu-

* Zelter's Briefwechsel, vol. ii. p. 90.

ral unalienable rhythm, which is in principle essentially the same thing as the rhythm of music, and is truly valued and understood by those only who apply a well-trained musical ear to the living enunciation of intelligible speech. But why do we waste words on a matter so plain as this?—Who will contradict us?—The man who has an ear cannot; and the man who has no ear has nothing to say in the matter. It is curious, however, to observe into what a strange and unnatural position the Hephæstions and the Hermanns have brought us with regard to the natural connection between language and music. They have effected a formal divorce; and this divorce has lasted so long, that to those whom the tradition of the elders influences more than the living voice of nature, the divorce seems legitimate, and the union monstrous. Accordingly, some of our most ingenious elocutionists, who have endeavoured to bring back the English language to its natural healthy state, by a living re-union with music, have either been overlooked altogether by the many, or honoured with the passing glance of dignified contempt from the erudite complacency of academical men.* And the musical doctors have not been slow to join in this concert. They, too, rejoice in the divorce; and apply-

* To those who have studied their own language with that attention which it always deserves but seldom receives, we need scarcely say that we allude here to Mr. Steele, the ingenious author of "*Prosodia Rationalis*," published so early as 1779, Mr. Thelwall, and Mr. Chapman, author of the *Rhythmical Grammar of the English Language*, whose title we have prefixed. On the meritorious labours of these ingenious men, Mr. Guest, in his late work on the *History of English Rhythms*, has the following piece of supercilious criticism:—"Before I close a book which treats thus fully of the rhythm of English verses, it may be expected that I should notice a series of works which have been published during the last thirty years on the same subject, by men, some of whose names are not unknown to the public. These writers entertain a very humble opinion of those '*Prosodians*,' who scan English verse according to the laws of Greek metre, and they divide our heroic line, not into five feet, but into six cadences. They are not, however, so averse to foreign terms as might have been looked for. With them rhythm is *rhythmus*, and an elided syllable an *appoggiatura*. One of these critics assures us that there are *eight* degrees of quantity in the English language; and, 'if the reader should deny that there is any such thing as eight degrees of it, in our language, for this plain reason, because he cannot perceive them,' it will be his duty to confide in the greater experience and better educated ear of those who have paid more attention to the subject. I will not follow the example set by these gentlemen when they speak of the poor prosodian. It may be sufficient to say, that much of what they advance, I do not understand, and much that I do understand, I cannot approve of."—Vol. i. p. 310. The circumstance of Mr. Guest having pinned these very pithy senten-

ing the social philosophy of Percy Bysshe Shelley to the practice of the fine arts, they declare the marriage of Lydian airs to immortal verse, to have been a thing most unnatural and monstrous from the beginning; a yoke of slavery which neither we nor our fathers were able to bear; the emancipation from which is matter of triumph and special gratulation. We shall quote a passage from Burney to this effect below.—That a man like Dr. Burney should have stamped such sentiments with the authority of his name is really serious. In what curious misapprehension these fevered fancies took their rise, we shall show anon; in the meantime we think it expedient to place ourselves, by way of precaution, under the orbicular shield of Professor Böckh, a man who, if he be not the *facile princeps* of European scholars, is unquestionably the first metrist of the age. This we shall make out with very few words, before concluding our present remarks; in the meantime we only say, that if any person shall produce to us in any European language an exposition of ancient metres and music, so clear, so comprehensive, so warm and vital, so exhaustive and completely satisfactory in all points, as Böckh's *Dissertation de Metris Pindari*, then we shall say that there are two suns in the firmament. We speak this deliberately

ees to the end of his volume, instead of having discussed this important matter formally at the beginning, shows what importance is to be attached to them, and to his work generally. He sits down to write a history of English rhythms, without having formed to himself any rational idea of what rhythm is; and having discovered, in the middle of his progress, that certain writers, "some of whose names are not unknown to the public," have presumed to doubt the dogma of the prosodians, that "English rhythms are made up of a regular succession of accented and unaccented syllables, without regard to quantity," and not being able to shun the matter altogether, he straightway assumes the *bravo*, and rejoices in the moral courage to despise what he has not the intellectual capacity to understand. Had Mr. Guest been so happy as to have received one or two lessons in elocution from the Rev. Mr. Chapman, he might have been saved from that legion of blunders with which his book is at present deformed. That mangling and dislocation of our finest verses which his scholastic doctrine of elision exhibits, gives proof of a rhythmical state of mind that some reasonable humility might have taught to confide in the greater experience and better educated ear of a musical elocutionalist of such acquirements as Mr. Chapman. As to crotchets, quavers, minims, semibreves, and dotted notes, which seem to be the real offence of those "men whose names are not altogether unknown to the public;" if Mr. Guest will cast a glance over to Germany he will find that *Voss*, so early as 1802, *Apel* in 1816, *Meineke*, in 1817, and other writers since that time, have employed the principles and characters of music to illustrate the rhythm of the German language, without offence. Shall pedantry find a home in England only?

and advisedly ; because it is a debt of international gratitude which we are bound to pay ; which we feel proud to pay to the genius of a man whose profound and wisely directed studies have, in one of the most important and difficult departments of rhythmical science, metamorphosed a chaos into a world, and resolved the discords of infinite babbling. With the authority of such a man we fence ourselves ; and we mistake much, if, after his opinion has been publicly spoken, any scholar in this country will hereafter venture to imitate the pernicious example of Burney, and attempt madly to construct a theory of metres without music.

The following passage from the introduction to the treatise on Pindar's metres is somewhat long, but as it gives a full view of the position which Böckh occupies, and we ourselves, in the matter of Greek rhythm, we have not dared to curtail it. It is almost a sin also to translate Latin so clear and flowing, so strong and manly as Böckh's ; but we wish to be universally intelligible, and the shade of Plato will forgive us if we mangle the music of one of his most tuneful disciples.

"When I undertake to write on the subject of Greek metres," says the learned Professor, "I know well what is the difficulty of the task ; a difficulty in the nature of the subject sufficiently obvious, and increased tenfold by the irremediable loss we have suffered of the most authoritative books of the greatest masters of musical science among the ancients. There are some indeed, in the present age, who, puffed up with vain conceit, bear very lightly the loss of the precious relics of Hellenic art ; they cannot bring themselves to believe that the ancients knew any thing on the subject of music worth knowing, and are in haste to forget that a people who invented numbers so skilfully, and practised them so successfully, must have also seen most deeply into their nature ; especially as the Greeks were in nothing contented with mere empiricism, but reduced all practice to a scientific system, and subjected it to the keenest scrutiny of reason. That a Greek artist must have understood the nature of musical rhythm better than we do, is, from the nature of the case, quite certain ; their language is formed, not like ours, upon principles addressed to the understanding only, but upon musical principles almost exclusively ; we bring the root or significant part of the word prominently forward in all our flexions and compositions ; the Greeks are little concerned about this, provided the whole word be full and musical in its flow. The mere intellectual is, for poetical purposes, postponed to the musical value of the word. But the moderns, with that one-sided culture of the understanding which characterizes them, have not been able to understand this devotion of

the Greeks to the beautiful ; and in criticizing them have merely shown their own barrenness. Others, less unreasonable, have allowed to the ancients, a fine practical ear for music, but have spoken of their metrical science as most incomplete and unsatisfactory. But after much, and not undigested study of the history of music among the Greeks, I have come to a different conclusion ; and am firmly convinced that no art acquired among that people a more early maturity, whether we regard the genera and modes of the scale, or the measures of their poetry. And I contend not only that Pindar made most excellent verses, but that it can be made manifest to any man who has a musical ear, how, and why they are excellent, and upon what principles they are constructed. Do we not know, as an historical fact, that the ancient poets studied both the musical modes and the art of metres under regular masters, and according to a regular system of training ? What did Sappho teach her disciples if it was not this ? What other was the nature of that lyric *παιδεία*, Thomas Magister tells us Pindar received from Lasus ?* And the same Lasus, himself a poet, was not only a practical musician, but was the first who published works on music, as we learn from Suidas, and other authorities. Plato tells us that Socrates received regular instruction in rhythm from the musician Damon. The facts on this subject are indeed so well known that it were idle to repeat them. Music was such an essential and pervading element in Greek education, that in the flourishing times, no freeman was so uncultivated as not to understand the art of metres ; and with the living accompaniment of music and dance, able to follow easily and instinctively the most intricate mazes of a Pindaric strophe. These things being undenied, who is there that must not lament that unhappy divorce of the living union of metres and music, which was first instituted by the Alexandrian grammarians, a set of most ignorant men, whose narrow doctrines have been handed down to us by Hephæstion, Longinus, Draco Stratonicensis, and the herd of Latin grammarians and Greek scholiasts. Nor have the learned of modern times showed much zeal to mend the matter. The precepts of ancient musical wisdom which St. Augustine, Aristides, Quintilianus, Dionysius Halicarnassus, and, above all, Aristoxenus, have preserved, Bentley, Hermann, and others, partly were ignorant of, and partly despised. For these reasons, without disputing the merits of Voss, Apel, Finkenstein, and others who have gone before me in the same track, I have thought it necessary to put my hand again to the plough, and to try what can be done by the union of ancient learning and modern science ; in order, so far as my small capacity goes, to restore to Pindar that perfection of musical numbers for which, as Plutarch nar-

* Λάσος τῷ Ερωστίνῳ μελοποιῶν παρ' ὃν τὴν Ἀρσικὴν ἐπαίδευσθαι.—Vit. Pind.

rates, he, above all the ancient poets, was so distinguished?—

We now see plainly where we are, and what we are about. Dissatisfied with the pedantries of Hephæstion and Draco, little edified by the metrical oracles of 'the most wise Tricha,' and Elias the monk, and not illuminated in our benighted path by the prying microscopic empiricism of Porson,* we wish to try whether by the aid of the common principles of musical rhythm, and led on by the erudite pioneering of thoughtful Germany, we may not be able to reconstruct a strophe of Pindar or Æschylus, as it actually was sung amid the applauding echoes of an Olympian race-ground, or an Athenian theatre. Nor will the task be difficult. For we do not aim at the high game of the musical scales, and the mysteries of the Dorian and Hypodorian modes; our present business is only with the rhythm of Greek poetry; and when we have thrown overboard a few narrow dogmas of the prosodians, and baptized with their proper names a few twisted prejudices of modern musicians, with Böckh for our captain, and Apel for our steersman, we hope to sail gallantly before the wind. We only fear lest some sensible person shall think our zeal in such a cause ludicrous; but let that person recollect that we have one university in this country which makes a boast of teaching nothing but Greek; and the wisdom of Iambus and Trochee (*valeat quantum*, as the lawyers say) must be taken as part and parcel of the privileged merchandize. It is fit, therefore, that we should once for all come to an understanding about this matter, however small it may appear; nor are we of the number of those who value all speculative knowledge merely in the degree that it can be made to bear directly upon the necessities of the present. We set a price upon the theory of Greek metres that no mechanical philosophy can measure; always, however, with this caveat, that it be not viewed narrowly as an appendage to the scholastic study of a dead language, but as a living component part of the divine science of music.

The most important matter to attend to in entering on our present inquiry is, the relation between Rhythm and Metres; a matter which has been sadly confused both by modern musicians and ancient grammarians. The modern musicians (we speak especially of the English, from Burney to

Dannely*) seem all of opinion that the Greek musical rhythm was a very different thing from the modern, in so far as instead of being the free master and disposer of poetical measure, it was its slave and puppet; an idea perfectly monstrous and unnatural, and what is most extraordinary, quite in the teeth of what the ancients themselves say on the subject. The ancient grammarians, as we shall see immediately, had a far more rational idea of rhythm; but their error lay in making no use of that idea. They knew very well that rhythm was one thing and metre another; they knew also very well that rhythm was the continual controller and modifier of metres; and that it was as vain for them to attempt to shake their art free from this controlling power of rhythm as it was for a son under the Roman law to acquire any *persona standi* independent of his father. Πάτερ μετρον Ρυθμος καὶ Θεός, "The father of metre is Rhythm, and a God." But the grammarians were too pedantic and too lazy to follow out this knowledge to its legitimate consequence; which would have been without ceremony this, that the art metrical can no more stand by itself without music, than criticism can stand without poetry, or Christianity without piety. Rhythm is the inspiring and informing plastic soul in all metres; and whoever attempts to separate the one from the other, and erect it into a separate science, attempts to construct a world without a God. This mad attempt, however, the ancient grammarians made; and not they only but the modern prosodians, many of whom (witness the above-mentioned Dr. Nott and Dr. Carey) have a sacred horror of the word rhythm; and as we have seen also in the case of Mr. Guest, nothing makes them fume and fret so sublimely as the bare idea of numbering the measures, instead of counting the syllables of poetry. There is this difference, therefore, between ancient and modern metrists in respect of rhythm; the ancient metrists are only practical, the modern both practical and speculative, Atheists. But to the proof of all this. That Dr. Burney, and those who have followed him, considered the ancient musical rhythm as slavishly dependent on the ancient prosody, is too well known to require any formal proof.† As to

* In the London Encyclopedia, Art. *Music*.

* "He gave up, I believe, the metrical arrangement of the choral odes as a hopeless business."—*Kid's Tracts*, p. xxiii. We wish Burney and Blomfield had followed his example. Fingering will not do here, and the freedom of lyric poetry scorns the monotonous uniformity of the Porsonian canons.

† "However ignorant we may be of the melody of ancient music, the rhythm, or time of that melody, being regulated entirely by the metrical feet, must always be as well known to us as the prosody and construction of the verse."—*Dissertation on the music of the Ancients*, p. 80. A proposition perfectly true where rhythm exists already in the metre, as in Dactylic verse, or 2.4 time, and in pure Trochaic, or 3.8; but as soon as an admixture of metres takes place, the proposition becomes posi-

the grammarians, it is not perhaps so generally known (for Burney makes no mention of it) that they are in the constant habit of drawing a broad line of distinction between their own art and that of the rhythmopœist; and moreover—what is of supreme importance in this discussion—some of them have been honest enough to let us into the secret of many pleasant little controversies that existed between them and the musicians with regard to the true quantity of syllables. The same bickerings occur also in modern times; but Burney, Forkel, and others assume that the ancient rhythmopœist was the mere slave of the metrician in all these matters; which if it had been really so, we may well ask what use was there for *ρυθμοποιία* at all? Why did Aristoxenus think it necessary to write a book of rhythmical elements, (of which unhappily only a fragment remains,) if musical rhythm and metrical feet had been the same thing? But let us hear Quintilian (lib. ix. c. 4.) “Rhythm,” says he, “consists in the space of time; metre also in the order; the one is of quantity, the other of quality.” And further on he says, “Rhythms have free spaces, metres bounded; these have certain closes (clausulæ), those run on as they began, till they come to a *μεταβολή*, or change of rhythm. Rhythms also receive pauses (*inania tempora*) more freely than metres; for though metres are not without pauses, yet the license of rhythm is greater, where they are wont to measure time by their mind, and by the beating of their feet and fingers; marking the intervals also with certain notes, and taking accurate count of how much time every space has allotted to it.” How can any man that ever played the simplest air on the piano, or hummed the simplest tune, misunderstand this? Rhythm was just to the ancients exactly what it is to us, namely, “Time;” and so far from being the slave of metres, it was its proper and only business to arrange these metres into equal spaces, or bars, as we do also. But we entreat particular attention to that phrase of Quintilian, when he says, “Rhythmis libera spatia, metris finita sunt; et his certæ clausulæ, illi quomodo cœperunt, currunt usque ad *μεταβολήν*,”—which he repeats distinctly in the next page, “Nam rhythmī ut dixi neque finem habent certum, nec ullam in contextu varietatem, sed quā cœperunt sublatione ac positione, ad finem usque decurrunt.” Can

tively false. In this case, so far from the metre being the regulator of the rhythm, the rhythm is superinduced by the rhythmopœist to regulate the metre. Succeeding writers follow Burney and baptize ancient rhythm *syllabic*; as if all rhythm were not necessarily syllabic wherever music and poetry go together.

any man reconcile these passages with Dr. Burney's monstrous doctrine, that the time of Greek music was changed with every bar, slavishly humouring the metrical feet instead of wisely controlling them? Well might he compare the hymn to Calliope to a dance of Hottentots or Cherokees! But we do not believe that even Hottentots or Cherokees dance out of time systematically. The French indeed may have done such things in their mad days;* for there is nothing so mad that has not once on a day been enacted by a Frenchman; but this is no reason why the wise and well-tempered Greeks should have indulged in such musical capers and convulsions. Our excellent rhetorician expressly says that it was the office of rhythm to run on in a continuous flow controlling the variety of metres; and shall we after this repeat the strange jerk-and-start style, which our modern musicians have fathered on the most musical people of antiquity? But we do not stand on Quintilian's witness alone. We have a much more decided testimony from Longinus, who in his prolegomena to Hephæstion (p. 139) says in few but decided words, “Rhythm and metres are different; for metre has fixed and unbending times, long, short, and doubtful, which doubtful syllable, however, in actual versification must always be either long or short; but *rhythm draws the time at its pleasure, and sometimes even makes long short and short long.*” Dr. Burney speaks of the Greek metrical feet as if they were synonymous with rhythms;† but the grammarians, as we see, make a broad and marked distinction; and Marius Victorinus (Putsch, 2482) especially, when setting forth the doctrine of rhythm, makes a classification of feet as falling under the different rhythms, which it had been well

* “Intermixtures of different measures were not uncommon in the works of composers of the fifteenth and sixteenth centuries, but generally produced nothing better than confusion.”—*Graham's Essay on Music*, p. 19. Burney and Seidel (*Charinomos*, Vol. II. p. 43), refer this absurdity specially to the French; but whatever its lineage, it is evidently a capricious madness of modern compositions. No natural, healthy music delights in such forced puppet-dance of sound; the time may be changed once, or even twice, thrice, in a short air, but for a particular and stirring effect; and not from bar to bar but from part to part.

† But the Doctor was not to blame as originating this inaccuracy of speech. It may be found everywhere among the ancients; and arose naturally enough from the circumstance, that some combinations of feet (as in Dactylic verse) actually were perfectly rhythmical in themselves without the superadded art of the rhythmopœist. But in mixed metres, such as those used by Pindar, there is manifestly no rhythm; to talk of rhythm in this case (as Burney does) was to make a word contradict itself.

if both modern musicians and modern metricians had more constantly attended to. He says there are three different kinds of rhythm, (not metrical feet), Dactylic, Iambic, and Pæonic, which from the account he gives of them, are evidently equivalent to our $\frac{2}{4}$, $\frac{3}{8}$, and $\frac{5}{8}$ time; by which three rhythms alone all continuous rhythmopœia is regulated (mark the word *continuous*). To adjust the lyric poem to one or other of these times was the business of the rhythmopœist; a fact which Victorinus very well knew, for he gives this relationship of metre and rhythm almost in the exact words of Quintilian and Longinus.

How then, it will be asked, did Dr. Burney ever fall into the blunder that rhythm and metre were the same thing, inverting thus the order of nature, and making the father servant to the son? We must confess we were a little puzzled to account for this at first; but on reflection the whole matter soon developed itself. Fortunately we had read Böckh's treatise "*De Metris Pindari*" before looking into the work of the Englishman, and on comparing this with that, three things became very evident. First, that Dr. Burney did not approach the subject with that love and devotion and reverence that belonged to it. He brought with him all the prejudices of a modern musician; and how great these prejudices are they who have to do with spoiled children know well. Stout old Doni had a tough battle to fight with the conceit of the moderns; and if we in this nineteenth century presume to assert that the ancient Greek music was not only equal to, but, to all appearances, superior to the modern in all reasonable qualifications, we shall no doubt meet with a sturdy opposition. But this we most deliberately assert, so far at least as that part of it is concerned to which we have given particular study, the doctrine of rhythm. The Greeks had quinary measures in familiar use, over and above the binary and ternary, to which we, without any cause in nature, have confined ourselves. It is a curious proof of Dr. Burney's partiality in this matter to observe, that while he brings both wit and argument to establish the monstrous absurdity that a people whose music consisted altogether in rhythm (as he will have it) had no rhythm at all, he is quite silent on the subject of the quinary measure as a peculiarity of Greek rhythm, and merely tags in a narrow remark of Tartini at the end of the chapter.* Dr. Bur-

ney's continual wonderment at the marvellous effects attributed to ancient music is also perfectly modern, and we are sorry to add also perfectly English. A German would never have dreamt of expressing surprise at any marvellous effects that might have been attributed to music; for he is not only more musical than the Englishman, and therefore more gifted with musical sensibility, but he is also more philosophical and more learned; and he knows very well that music among the Greeks moved the whole man, whereas with us it merely plays luxuriant arabesques upon the chambers of the ear. In the second place, with regard to Burney, it is quite plain he does not possess one tithe of the learning of Böckh, at least he does not make it manifest; and *de non apparentibus et non existentibus eadem est ratio*. In the third place, and this is the *origo mali*, it is plain that Burney had been confounded and put out of the right scent by the pedantry of the Prosodians, and their redoubtable doctrine of long and short. He took all this for gospel, and instead of modifying and moulding their chaotic doctrine of feet by the wide plastic principle of rhythm, he narrowed and tied down the free doctrine of rhythm and musical times to the artificial system of metrical feet and monotonous quantities.

We said above that the ancient musicians, so far from submitting the musical value of syllables to the arbitrary dictation of the metricians, had, on the contrary, frequent bickerings with them on that subject. We owe to Mr. Apel a reference to a curious

Tartini should have so conveniently forgot that the Greeks actually *did* execute it habitually may seem strange; but we have undeniable evidence in modern times not only that celebrated musicians have executed it, (which were a small thing,) but also that *the quinary is the natural measure of some national dances*. On this subject the learned and intelligent writer whom we formerly quoted is express. "Reicha says, from information sent to him, the manners and customs of the inhabitants of Rochersberg distinguish them completely from the other people of Alsace; their dances have a particular and remarkable character; the scenes of these dances have a very decided measure of five times. Tradition in the country carries back this music to the remotest antiquity."—*Graham*, p. 16. But the fullest exposition of the virtues of the quinary measure that we have seen is in that ingenious and admirable work of Mr. Seidel already quoted.—*Charinomos*, p. 36—41. The most interesting fact noticed here by Mr. Seidel is that of a Silesian boy who had taught himself music by the instinct of nature, and who often used the quinary measure, and that with the most striking effect. Considering all these things, it does seem strange that Apel, in his excellent work on metres, should have thrown the quinary measure of the Greeks (*πενθήμερον ἡμερολίον*) without ceremony overboard. One fact is worth a shipload of arguments.

* "Music has been composed of five equal notes in a bar, but no musician has yet been found that is able to execute it."—*Dissertation*, p. 82. How

passage in Marius Victorinus (de Mensurâ Syllabarum. Putsch. 2481) wherein this matter is fully explained.

"Among the metrists and the musicians," he says, "there is no small dissension as to the quantity of syllables. For the musicians say that all are not equally long, and all short syllables are not equally short; for some longs are longer than a long, and some shorts shorter than a short. But the metrists will not allow this, and tolerate nothing either longer or shorter than what nature in pronouncing the syllables herself produces. The musicians, however, go further, and in rhythmical modulations, or lyrical chants, by a circuit of protracted pronunciation (per circuitum longius extentæ pronunciationis) they make long longer and short shorter, according to the arbitrium of time. And they bring also examples against us from our own art, for they say that we cannot pronounce a short vowel with many successive consonants in the same time that we pronounce that vowel by itself. But this is a scrupulosity which we shall leave to the musical and the rhythmical doctors; and as we call the Germans tall in comparison of ourselves, though they are not all of exactly the same stature, so we shall call a long syllable a long syllable, and a short syllable a short syllable, without inquiring further into the matter."

This is a most choice passage. We entreat the student of Greek poetry to consult it in the original, as we have been obliged to curtail it in some respects; but the gist of it we have given. And let it not be imagined that the dispute here turned merely on that small matter of the number of consonants in a syllable. We observe that both Böckh and Hermann understand the Scholiast to Hephæstion, in a well-known passage of a similar import (Gaisford. 150), as quibbling with over curious subtlety upon this. The musicians could never have quarrelled with the metrists upon any such minute affair; they merely brought it forward as an argument *ad hominem* against the prosodians, as is perfectly plain from the language of Victorinus. He does not say that the controversy lay here; but after stating the case in a full and satisfactory manner, he goes on,—"*Afferunt etiam exempla quæ in metricis pedibus secum faciunt.*" Not content to quarrel with us on musical principles, they bring examples against us from our own metrical feet. And the musicians were right even here, as the student of Milton knows well; the poor grammarian was therefore beaten with his own weapons; and the naive similitude about the stature of the Germans, with which he tries to get rid of the scrupulosity of the musicians, is truly admirable.

We think the above and other passages, which we have cited, will be sufficient to dispel the delusion out of which Burney has raised such a strange superstructure. Let the prosodian make what artificial laws he pleases, the rhythmopœist is not bound by them. He moves in his own sphere as free and unshackled as any modern composer; he may make a long note longer, and a short note shorter, according as time or expression shall demand; he will not indeed run galloping and capering at a demi-semi-quaver pace as modern composers do, without the least idea that sense belongs to music as well as sound; he will be sober, discreet, manly; he will know that he is addressing an intelligent being; he will glory in the consciousness that his divine art contributes, not merely to the amusement, but to the moral culture of his fellow man.

Burney speaks much of the monotony and uniformity of ancient music. He has no authority for this assertion, except the false theory that the ancient rhythmopœists were the slaves of the prosodians. We may mention, however, as a counterpart to this, that if the psalm-like solemnity of an old Pindaric Ode may have a tendency to lull our falsely excited senses asleep; the hurry and skurry, and senseless skirmish of our modern music, would have shaken an ancient Greek into a fever.* But the ancient Greeks had as much variety in their music as good sense and intelligibility allowed;

* "Nam ob divulsionem sensuum, confusio-nemque multarum ac diversissimarum motionum, quas polymeliæ (modern harmony) usus, ac multiplices battilogiæ inducunt; nulla certe Rhythmismi forma; sed incerta potius, ac dissipata consurgit; quæ enervatam quandam, et, ut ita dicam, *febriculosa* musicæ speciem indicant. Ut enim qui febricitant inordinatum habent pulsum atque inconstantem; sic in ejusmodi concentionibus, numeri ferme inordinati confusique sunt; unde actuositas illa atque energia, quæ in saltationum chorearumque melis tantopere delectat, animosque nostros afficit, ac delectat, vehementer ibi desideratur."—And so on in a strain of very just indignation against the quib and cracker style of modern music. Doni de Præstantiâ Musicæ Veteris. Florent. 1647, (p. 69.) At the end of this work in our edition, we observe a list of Doni's works published, unpublished, and commenced, (*edita—inedita—incepta*); and among this latter class we observe the title "*De Re Metricâ libri duo; in quorum priori Poematum varîæ species, ob diversum carminum dispositionem, ex Hephæstione, et aliis dilucidè ostenduntur; in alterno carminum ipsorum rhythmica ratio summam traditur; ac nonnullæ eorum species a nobis excogitatæ e Rhythmicis potius quam Grammaticæ fontibus exhibentur.*"—Can any of our musical readers inform us if this work was ever completed, and if completed, ever published, or if it is still lying in MS. at Florence?—Doni was the very man to write a good work on Greek metres; ages may elapse before such another enthusiast arise; and without enthusiasm in a matter of this kind nothing can be done.

and of this we have a clear proof in the following passage from the rhythmical elements of Aristoxenus, (Morelli, p. 290), to which our attention was first directed by Professor Böckh.

After having said that feet do not extend beyond four times, as, v. g. — — — —; for he does not use the word *σημειον* here in its common sense of the shortest moment of time; he goes on to say,

“But we must not deceive ourselves by imagining that the doctrine holds universally that a foot can never be divided into more than four parts; for some are divided into double that number, and into manifold divisions. It is not however by its own virtue that a foot suffers these divisions, but they are effected by rhythmopœia; for the material component parts of the foot are one thing, and the divisions it suffers from rhythmopœia another. The parts of a foot remain equal both in number and magnitude; but the divisions produced by the rhythmopœia partake of great variety; as will be seen in the sequel”—(The sequel, alas! has perished.)

This quotation is the last which we shall produce on the nature of Greek rhythm. We have no occasion to trouble ourselves, or our readers, with more erudition. We have gained all that we want, and a great deal more. We have proved that the lyric rhythm of the Greeks was not a fitful disjointed thing, performing an awkward puppetry in obedience to the laws of pedantic prosodians; but as rich, fluent, varied, and expressive, in every respect, as our own. Let any person now read the following passage from Dr. Burney, and consider what value is to be put upon it, or whether any value at all.

“Upon the whole, even the imperfect view which I have given of the rhythmical resources of ancient music, may be sufficient to warrant something more than a doubt, whether a fixed prosody and the rigorous unaccommodating length of syllables be any recommendation of a language for music; that is, whether a music formed and moulded closely upon such a language, must not necessarily be cramped and poor in comparison of that free unshackled variety, that independent range of rhythmical phrase which form so considerable a part of the riches of modern music. I am happy to find an ingenious writer of the same opinion. ‘Music,’ says Mr. Webb, ‘borrows sentiment from poetry and lends her movements, and consequently must prefer that mode of versification which leaves her most at liberty to consult her own genius.’ Let the most inventive composer try to set half a dozen Hexameters, pure Iambics, or any other verses that will fall into a regu-

lar, common, or triple time, and he will soon find that no resources of melody are sufficient to disguise or palliate the insipid and tiresome uniformity of the measure; and as for anything like expression, we may as well expect to be affected by the mechanical strut of a soldier upon parade. In other metres, where feet of different times are intermixed, some variety is indeed acquired; but it is a misplaced variety, which, without obviating the tiresome effect of a confinement to no more than two lengths of notes, adds to it that of an awkward and uncouth arrangement; the ear is still fatigued with uniformity when it requires change, and distracted by change where it requires uniformity.

‘Modern music on the contrary by its division into equal bars, and its unequal subdivision of these bars by notes of various lengths, unites to the pleasure which the ear is by nature formed to receive from a regular and even measure all the variety and expression which the ancients seemed to have aimed at by sudden and convulsive changes of time, and a continual conflict of jarring and irreconcilable rhythms.’*

The whole chapter on rhythm in Dr. Burney’s celebrated dissertation is in the same strain, more like a caricature in all things than a veritable outline. It has always seemed plain to us, that to revenge himself of Aristides, Bacchius, and Euclid, for the fruitless trouble they had cost him, the learned historian had determined to employ his wit in making them appear ridiculous. Aristides he sneers at as a silly old dreamer, at the very time he is quoting from the worthy ancient a passage that proves ancient rhythm to have been infinitely more expressive than our own. And no wonder: for we have confounded all rhythm in a fevered and intoxicated dance of sounds, amid which the natural movement of the music is seldom discernible. The passage of Aristides occurs in p. 76 of the dissertation. “Time of equal proportions (common time) is graceful; and that of odd numbers or sesquialterate proportion ($\frac{3}{2}$) is more proper to excite commotion. Double time (triple) is a kind of mean betwixt the graceful and the turbulent.”—We have little doubt, that if the jog trot of modern musical practice could be induced to adopt the quinary measure, its effect would be found to be just that here described by Aristides. It is a remarkable thing that a modern writer on the theory of rhythm, gives to the quinary measure exactly the same character as given by Aristides; and this without any Hellenizing prejudice, but simply as an intelligent Ger-

* Dissertation, p. 85.

Now, if the grammarians had only set down this in notes (or, having none, invented a notation for themselves) they would have discovered a plain principle, the consistent application of which would have saved them from a thousand blunders. But they wanted courage to do this. It would have been making a plunge into that very region of music, by abstracting themselves from which they had created their art metrical into the dignity of a separate science. It was natural that they should be jealous of a doctrine which deranged their fundamental doctrine of long and short; for as the Elegiac verse is actually scanned by a well-tuned musical ear, we have not only tall Germans generally, as Victorinus says, but one German taller by a third than his neighbour, and another as tall again. To avoid this untoward confusion of ideas, the metricians shrunk immediately back into their old shell; they passed by truth, and saw her only as in a dream; they touched the hem of the mantle of a god, but it gave out no virtue to them.

Let us now apply the preceding observations practically, and endeavour to exhibit the rhythm of a Greek chorus on the principles above set forth. We shall choose one from Æschylus; sufficiently entangled indeed, upon the principles of erudite metricians, but plain and self-evident to the perception of the greenest tyro in music. Dindorf's reprint of the Glasgow (Porson's) edition of Æschylus, exhibits, at verse 490 of the Eumenides, the following arrangement:—

Strophe. Νυν καταστροφαι νεων
θεσμιων, ει κρατη-
σει δικα τεκαι βλαβα
τουδε μητροκτονου.
παντας ηδη τοδ' εργον ευχερει-
α ξυναρμωσε βροτους.
πολλα δ' ετυμα παιδοτρωτα
παθεα προσμενει τοκευ-
σιν, μετα τ' αυθις εν χρονω.—

The first thing that strikes the unsophisticated reader here (for we speak not to those whose sense has been blunted by scholastic barbarism) is the strange and uncouth disjoining of the words which this chorus exhibits. One might imagine at first sight that the philosophy of this was to be found in the musical bars by which the verses were sung; an original way of printing poetry certainly, but at all events intelligible. This, however, cannot be the case; for as Trochaic verse was generally measured by dipods, if it had been intended by these breaks in the words to represent the musical bars, the

editor should have proceeded consistently thus:—

Νυν καταστρο-
φαι νεων
θεσμιων.
ει κρατη-
σει δικα τε
και βλαβα.—κ. τ. λ.

And indeed many of Burney and Blomfield's choruses seem arranged on some principle of this kind; though not always consistently, as it is difficult for a man, in the teeth of nature, to remain for a long time consistent in error. But there is not the least reason to suppose that these painful dislocations, which are everywhere to be met with in our English editions, have any foundation in music, ancient or modern. The scholiasts of Pindar, who were as great proficient at this art of disjoining verses as any modern of the Porsonian school can be, never hint the least acquaintance with music. And as for this chorus of Æschylus, we suspect it owes the shape in which it here appears to one of Porson's mechanical rules, that as many verses as possible should be made to run on continuously in the same metre.* Of course Porson, as a regular metrician, was not bound in laying down this rule to pay any attention to sense, poetry, pause, or rhythm. But to proceed. The first verse is a Trochaic dimeter catalectic in the language of metricians; and the second verse standing separately seems intended for a Cretic Dimeter. These verses being so placed answer exactly to the two that immediately follow; and as we have just hinted, this uniformity seems to have been the thing aimed at. But we have two objections to this arrangement. In the first place we do not see why the line should not rather be made to terminate with the sense at *θεσμιων* than at *νεων*, making a violent and uncouth hiatus between the adjective and its substantive; and in the next place we demur to the disruption of the rhythm by bringing in Cretic metres at all; for the Cretic is a quinary measure, and the Trochaic, which gives

* "Ut eadem aut similis versuum species quam sæpissime recurreret," preface to the *Hecuba*. On which canon compare *Lachmann*, in his excellent work on the choral system, p. 10. "At Porsonus cum partem veri perspiciebat stropharum versus metris quibusdam regi vidisset, erravit tamen, dum partim omnem poetarum libertatem constringit (the great pedantry of the Porsonian school), partim ea quæ regulam non sufficientem effugiunt, ad nullam certam normam exigere potest." See also our article on English and German Scholarship, No. XLIV.

the rhythm to the chorus, is ternary. It may be allowable for particular effects to bring in this turbulent rhythm (as Aristides calls it) into the equable flow of the Trochaic; but as a general rule, and particularly in the middle of a sentence, and divorcing an adjective from its substantive, such a procedure

is altogether barbarous. We shall therefore cartail the first four lines into three, and read thus—

Νυν καταστροφαι νεων θεσμιων,
Ει κρατησει δικα τεκαι βλαβα
τουδε μητροκτονου,

the musical value of which will be

where the reader will observe we have used dotted notes to fill up the time of those long notes after which a rest did not seem necessary; and we shall give satisfactory reasons for this immediately. The verses that follow will be arranged on the same principle, and present only two peculiarities. In the beginning of the fourth verse we find another Cretic prefixed to the Trochaic dimeter catalectic; and we ask with what consistency does this Cretic stand here? If two Cretics make a separate line, why not one? But our English editions of Æschylus are full of these inconsistencies; and we came to the conclusion, after examining several choruses of Bishop Blomfield's Agamemnon, that he was governed in these matters on no principle but whim. For instance, in one part of the introductory chorus to the Agamemnon he divides thus—

φανεντες ι—
κταρ μελαθρων χερσ εκ δοριπαλτου.

And we wish to know why, in another part of the same chorus, he does not divide thus—

Zeus ος—
τις ποτ' εστιν ει τοδ' αν—

Why does he not honour Jove with a separate line in this solemn passage, especially as Hermann is convinced (see the treatise de Mensurâ Rhythmicâ) that we have here a *Trochæus semantus*, that is to say of twelve times, equal in value to the whole dimeter that follows? But the whole of this magnificent opening chorus has been so completely mangled and dislocated by the

* Burney, in fact, who sticks at no metrical barbarism, gives us an example of this elegant Cretic monometer in the fifteenth chant of the chorus in the *Persæ* (*Tentamen*, p. 34.)

βασιλει—
ου τιά—
ρας φυλαρον πιφανσκων.

In this, as in many other Burnecian choruses, only two or three lines end in a complete word. All the rest are violently and mercilessly dislocated.

learned bishop, that no lover of poetry can bear to look upon it. And if we throw taste altogether out of view, the erudition of the matter is plain; Æschylus is in the constant habit of adding prefix feet to his metrical series; it always lends variety to the measure, and often dignity.

The other peculiarity which we have to mention, is the occurrence of a Dactyle instead of a Trochee, in the last line of the strophe:

παθια προσμενει τοκευσιν μετ' αυθις εν χρονω.

This, if we were at all infected with the metrical dogmatism of Porson or Hermann, we should immediately expunge. "Dactylus, si quando in his versibus reperiatur," says Hermann, "nisi ille in nomine proprio sit, non dubium est quin emendatione tollendum sit."* There can be no reason for being so imperative about the matter, unless it be that the Dactyle, according to its common measure, has a time too much for this Trochaic bar. But Hermann knows well that there are irrational as well as rational Dactyles, nimble and heavy. We shall therefore allow the Dactyle to remain; and mark it for the present, till we have had time to explain, in the common way with a dot, thus:

But one other matter still remains. If in order to avoid the breaking up of the lines, we write the fifth and sixth lines in one; thus:

παντας ηδη τοδ' εργον ενχερεια συναρμοσει βροτους—

Does not this give a most unwieldy, unmanageable line? Certainly it is somewhat longer than lines generally are; and may, among other things, be very inconvenient for the size in which books, in these cabinet times, are often printed; but the length of poetical lines is a matter entirely arbitrary, and the

* Element. Doct. Met. 80.

present has only seventeen syllables. If Hephæstion were any authority in such matters, we say further that he allows as a gene-

ral rule thirty-two times to a verse ; but he mentions also a Choriambic hexameter catalectic :

— — — — —, — — — — —, — — — — —, — — — — —, — — — — —,

which has thirty-five times, and twenty-three syllables. But we are unwilling to quarrel about the length of the lines : that is a work for a printer rather than for a critic. Only let the words not be torn asunder, forming a discord both to eye and ear ; let the lines never be so arranged as to give the appearance of a new rhythm in the middle of a sentence or a word ; and especially in the full swell of an Æschylean chorus, let everything petty and fragmentary by all means be avoided.

We have now to explain the matter of dotted notes. Apel used them freely on all occasions as in modern music. In this he was at first followed by Böckh ; who, however, after a thorough and searching study of the ancient musicians, has come to the conclusion that the ancients did not use notes of triple value. The matter, however, is open to conciliation. That the ancients did not compose in musical feet or bars, in which the proportion of one note to another was as 3 to 1 ; thus :

is undeniable.* Aristoxenus expressly disapproves of this relation. But it is of the proportion of one note to another in a musical foot that he disapproves ; he nowhere says that a single note by itself cannot be used of a triple value. It is, indeed, altogether impossible that he should have said this ; for the triple note, as Apel well remarks, is as necessarily given with triple time, as the double note with common time. And Böckh himself, in setting a Pindaric ode to a time of $\frac{6}{4}$, uses a long note of the value of six times. It seems plain, there-

* Δευτεροί δε εἰσι οἱ ἐν τῷ τετρασημῷ μεγεθεῖ. εἰσι δὲ οὗτοι δακτυλικοὶ τῷ γενεῖ· ἐν γὰρ τοῖς τετρασὶ δυο λαμβανονται λογοὶ ὁ τε τοῦ ἰσού, καὶ ὁ τοῦ τριπλασίου ὃν ὁμὲν τοῦ τριπλασίου οὐκ ευρυθμός ἐστιν, ὁ δὲ τοῦ ἰσού εἰς τὸ δακτυλικὸν πιπτει γένος.—Aristox. Rhyth. Elem. p. 302. But we shall not undertake to say that the ancients did not in practice vary the Dactylic metres with something similar to a dot, as in the beautiful Scotch air, "Saw ye my wee Thing?"

for it is one thing to use a rhythm systematically as a rule of composition, and another thing to employ it occasionally as an ornament. Besides, the irrational notes of the ancients were always at hand for emergencies of this kind.

fore, that he has no intention of denying Apel's doctrine, as applied to the prolongation of single notes forming a bar or complete foot in themselves.

With regard to the equalization of the Dactyle, the matter is different. The modern method of taking a half of the values from the next following note is altogether arbitrary. It is as easy to borrow from both the short notes that follow ; and then as Böckh has arranged his ode, we shall have, in $\frac{3}{4}$ time, the proportions

$$2 - 1 . 2 . 1 . = 3 . 1\frac{1}{2} . 1\frac{1}{2} .$$

$$- \cup . - \cup = - \cup \cup .$$

that is to say, the Dactyle, by the art of the rhythmopœist, made equal in value to two Trochees, without deranging the natural proportion of equality, in which the essence of the Greek Dactyle consists. And in the same manner the Dactyle in our present chorus may be equalized to a single Trochee, without using the modern expedient of dots. For if the Trochee be represented by

$$20 . 10 = . 30$$

the Tribrach will be

$$10 . 10 . 10 = . 30 .$$

and the nimble or irrational Dactyle,

$$15 . 7\frac{1}{2} . 7\frac{1}{2} = . 30 ,$$

instead of the false unequal Dactyle, brought out by the modern custom of dotting, which is

$$15 . 5 . 10 = 30 .$$

Böckh, we believe, was the first to suggest this method, by which the ancient rhythmopœist might equalize feet of common and triple time, without deranging the natural proportions of these feet, or introducing the forbidden proportion of 3 to 1 ; it seems sufficiently obvious, and far more mathematical than our hobbling system of dots.

We have one remark still to make before leaving this part of our subject. With common and triple time, the student who is versed in music, can never be much at a loss ; but with regard to quinary measure, the ears of most Englishmen are not sufficiently cultivated to enjoy its rhythm. A compromise must therefore be made here ; and we shall be compelled to chant the Pæonic odes of Pindar ($\frac{5}{8}$) as if their rhythm were $\frac{3}{8}$. Thus :

Αναξίφορμιγγες υμνοί—

τινα θεον, τιν' ἥρωα, τινα δ' ἀνδρα κελαδῶσομεν·

We have been able in the above observations only to hint hastily at the principles on which, building upon the musical foundation laid by Böckh and Apel, a rational and satisfactory doctrine of Greek metres might be established. We have only to remark further, that though the principles, when once unencumbered from erudite error, seem few and simple, yet their practical application to the multifarious varieties of Greek choral poetry will require a union of musical experience, Greek erudition, and poetical taste, seldom united in one individual. Nor is it to be imagined, while the present most unmusical system of British education remains unchanged, that any author should devote his time to a task which would receive small favour from the prejudices of the old, and meet with nothing but sneers from the superficial cleverness of the rising generation. To set Pindar to music, may appear as mad an idea to many as that of Dawes to translate Milton into Greek; and yet it is from the nature of the case most certain that, till music be universally cultivated in our schools and universities, and our young men be taught to chant the Greek choruses to some manly and solemn airs adapted by experienced composers, any thing like a natural and healthy sympathy with these *songs* (for they are not *poems* or *verses* in our modern phrase), is not to be looked for. We shall wait with patience for the happy era when our practical life shall be more poetical, and our educational training less scholastic.

The reader will now be in a condition to judge how much of M. De Quincey's opinion of the Greek lyric metres (quoted above) is true, and how much of it is false. It is true in so far as the old traditional arrangement of the Pindaric strophes has *in itself* no music, or hint of music whatsoever, but rather jar and discord; it is false in so far as by a well-cultivated musical ear these same verses may be modulated, and actually are modulated into sweetest music; and this modulation will be materially assisted by such a rhythmical arrangement of the verses as that given by Böckh. We do not say, however, that no man ever was sensible of the music of Pindar's odes before Böckh. Nature is stronger than art; and the scholiasts, with all their mechanical blundering, were not

able altogether to unhinge the strong rhythmical architecture of the Theban. Neither do we say that none but a musical man can understand the rhythm of Greek choral poetry. Walter Scott was no man of tune, yet he wrote good verses. But a musical man undeniably has immense advantages in comprehending the rhythm of a language, where syllables, subject to certain modifications, are, in fact, musical notes. And if a man will not only read Pindar rhythmically, but aspire to build up a formal system of rhythmical science, how can that be done other than on musical principles, seeing that rhythm, and rhythmopœia, belong to music and not to grammar. As to *metrical* science, that without rhythm is a thing without meaning; even as the sentences of a letter have no meaning save *in* the letter. We are not so uncharitable, however, as to say that prosodians and metrical men without rhythmical science, have, in fact, no perception whatever of the beauty of those verses they so curiously scan. Rhythm exists in most men, unconsciously, half-developed; and all cultivated Hellenists do, even at the present day, insinuate, as it were, rhythm by instinct into the most unrhythmical divisions of Burney and Blomfield; they undo practically the doings of the prosodian, even when they seem to approve of his theory. Despite of himself, a good reader uses more than two quantities in his elocution; despite of himself, he equalizes seemingly unequal times; and thus the doctrine of Mr. Chapman, which has been so much vituperated, proves itself in the very practice of those who gainsay it.

Our view of the doctrine of Greek rhythm would be very incomplete without an historical review of the different writers who have distinguished themselves in this curious and interesting department of musical science. We shall, therefore, though limited considerably by the space allotted us, conclude our present remarks with a short sketch of the principal scholars, who, within the last fifty years, have devoted their attention to this subject.

In the van of discovery here, and preceding the period to which we confine our attention, is Richard Bentley, to whose gigantic genius it is the highest praise to say, that even at the distance of a century it continues

to strike awe into the soul of the most despotic of modern metricians, Godfrey Hermann. Bentley was in metres, as in every thing else, the most free and independent of thinkers; in the originality and boldness of his ideas more of a German than an Englishman. He anticipated Wolf's theory of the Homeric ballads; and had his attention not been directed to nobler themes, there seems no doubt that he would have left nothing for Hermann to do in the science of ancient metres; (though we shall not say he would have intercepted Böckh.) Of this the celebrated "Schediasma," is of itself sufficient proof; there is a strong sense, a vigour, a breadth, a manliness there that would have steered a free course through a most intricate track, equally free from the curious metaphysical puzzling of Hermann, and the minute microscopic laboriousness of Porson. Bentley is a man of flesh and blood; he does not work with his head alone; he shows a hard Herculean muscle; and every thought is a stroke. Thus he escapes all the vulgar pedantry of mere grammarians; he does not flounder through abstractions, or finger mere letters and syllables; he goes straight up to the living reality of the thing, and hears the Roman flute-player beating time to a Terentian Tetrameter, while grammatical men are swaying between Systole and Diastole, and wondering what mighty mystery the arsis and thesis of Marius Victorinus may reveal. Bentley also, like a man of ideas, comprehends the totality of the thing, while smaller men scan the parts. It is remarkable that in that Terentian dissertation he seldom speaks of the laws of metre, but of the law of rhythm; a phraseology which at once shows his superiority to his predecessors, the Greek scholiasts, and marks him out as a man from whom even the musician Burney might have borrowed a useful hint; and the scholar may recollect the passage where the great critic, discoursing of the frequent spondees in the Roman Iambic, uses the following remarkable words (p. xii): "*quod tamen opinor celeri pronuntiatione juvabat et occultabat actor, neipse a Tibicine rhythmum Græcum servante discreparet.*" Here we have a distinct recognition of the controlling power of rhythm, in the equalization of unequal feet; here we have plain common sense putting into the hand of a sound-headed man, the great leading principle that afterwards, in the hands of an Apel and a Böckh, was destined to bring order into confusion, and change discord into harmony. It must, therefore, ever be matter of lamentation, that such an healthy living man as Bentley did not apply his mighty talents to a subject which they were so well fitted to

comprehend; as it is, his observations are merely incidental, and not without admixture of pernicious error. In the use of the words *arsis* and *thesis*, he followed the grammatical, not the musical authorities, and thus confirmed ancient error, when he was in a condition to have exploded it for ever. Words are the stereotypes of ideas; and arsis and thesis, which had originally no meaning but in the living union of music and poetry, became, by the stamp of Bentley's authority, the legal property of grammarians and metricians, who scanned them with curious eye, and fingered them with sedulous hand, and at the end of the chapter had as clear ideas of their meaning, as if they had been Phœnician inscriptions, or the cuneiform characters of the Babylonian bricks.

The following passage from the pen of Hermann, is real eloquence; and that he should have so written is the highest praise of Hermann, as it is the noblest eulogy that ever was pronounced on Bentley.—"Bentleius, si non perfecit hanc doctrinam, ac potius sæpe inventis suis etiam cum damno Terentii usus est, tantum abest ut id quidquam de laudibus suis detrahat, ut potius nihil in eâ re sit quod cuiquam debeat mirum videri. Nullæ enim unquam magno in genere magnæ conversiones factæ sunt, quin conjunctæ fuerint cum ruinis etiam earum rerum, quas vel potuisse servari, vel debuisse postmodo appareret. Itaque ut fulminis pernicio nonnunquam vis utilitate superat, ita in magnis ingeniis, quid condiderint, non quid condendo everterint, spectandum." . . . *

This sentiment may be applied with almost equal propriety to Hermann himself; to whom, by a long leap, passing somewhat ungraciously over Dawes and Reiz, we are compelled to pass. Godfrey Hermann raised up the most complete scientific architecture of metres that the learned world ever saw: but in doing so it has become manifest to many that he overturned common sense. The metrical philosophy of Hermann is a gigantic blunder; it remains, however, the blunder of a giant; and happily the consequences of metaphysical errors do not always extend to practice: Epicurus may be as moral as Zeno. The blunder of Hermann is a very obvious one; he went into the cold formal region of the understanding, for a philosophy that is to be found only in the living tide of poetic emotion. He scorned the empirical judgment of the ear, in a matter where the ear is the only judge; he asked an oracle from pure reason, where pure reason had no

* *Element. Doct. Met.* 66.

oracle to give. What fellowship has the Kantian category of causality, or the dynamical doctrine of forces, with the tune of a Dorian pipe, or the time of a Spartan march? . . . Can a man measure poetry by square and compass, or frame a bankrupt bill by poetic impulse? No sound man will dream of such things; but there are strange epidemics in the intellectual as in the physical world; and if tar-water can cure all diseases, why should not the Kantian philosophy explain all mysteries? It was Hermann's misfortune (a misfortune it certainly was to a metrist,) to be born under the all-controlling ascendancy of the critical philosophy; an influence from which he, as a German thinker, could no more hope to escape than Coleridge and Southey, as British poets, could escape having their young brains fired by the French revolution. Theology and poetry were Kantianized; even the mild constraining power of the love of Christ was transmuted into a stiff, stern, categorical imperative. What wonder then, that ancient metres should walk forth to the world? clad in the same heavy panoply of scholastic phrase?—for it was phrase only. Musical ideas could be charmed by no magic out of the critique of pure reason; it was not to be denied, that the pleasure we receive from rhythm is a feeling; and all feelings are empirical. Rhythm exists only in living and breathing things; the abstract idea of succession admits neither of arsis nor thesis; like the triangle of a mathematician, it is the symbol of many things, but itself is nothing. In the Kantian philosophy, as in the mathematics, there is no *reality*. Where then was Hermann's position?—he was called upon to set in motion the living undulations of poetic measures, and he found himself among an undistinguished succession of moments of time causing and being caused from infinity to infinity. In this abstract succession of infinite serieses he lost himself and his readers; and after wandering in the maze of pure reason for a reasonable space, he finds himself back again in the region of experience; and the empirical *deus ex machinâ* that saved him from his perplexity was the *ictus metricus*.

It were useless to follow into detail the continual recurrence of puzzling subtleties that this transcendental outset entails upon the "Elements of the Doctrine of Metres." As useless were it to attempt a serious, formal refutation of such misplaced metaphysics. When I sing a song, one note is not the cause of another, but I, and the inspiration of song within me, am the cause, the per-

manent, vital, originator of all the notes. Nor does the arsis cause the thesis (using these words in Hermann's sense), but I cause both arsis and thesis; they are, in fact, the same thing, mere modifications of my manner of existence; the one a stronger, the other a weaker exertion of my vital energy. Alternate accentuation, and non-accentuation are facts in the living organism of the universe, which must in every doctrine of metres be assumed, not explained. There is an order in the living succession of musical sounds or poetical emotions, which order is expressed by the words, equality and proportion. These things *are*. What more can we say? Do comparisons help us? the waves in the eternal ocean of vitality—the shuttle strokes of the ever-moving loom of creation!—Πολλων ὀνοματων μορφημια. Take the thing as it is and rejoice in it. You may as well ask for the cause of life, or the cause of God.

There is not an English Hellenist living, we presume, who does not admire the genius of Hermann. He is not merely a scholar; he is an intellectual scholar. He moves in the region of Bentley; how far above, or how far below, we should not wish to decide rashly. But is there an English Hellenist living, who in his course through that huge leviathan, the Elements of the Doctrine of Metres, has not been puzzled, confounded, stupified more than once? and to what purpose? Do there not remain after all straining of the cerebrum not a few things in the critical philosophy of metres, only less unintelligible and less confounding than Burney's antispastic dreams? When you ask for bread, does not this subtle juggling doctor of metres often give you a stone? and even when he gives you stout old wine, (as he has good store of it,) do you not feel at times as if it were mixed with sand, harsh, gritty sand, in the teeth? Is there not discord somewhere, or everywhere, in this proud temple of harmony? Doubtless there is; and how could it be otherwise, when a man squares sweet sounds by university logic, and makes a boast of formally upholding the unnatural divorce of metre and music? Here lies the sore. In the face of multiplied manifest floundering and stumbling the old pedantic error is persisted in. Strange! Hermann has a fine natural ear, a genius for numbers,—“Nam ego, quoniam etiam de me ipso mihi dicendum video, a puero, naturæ quodam instinctu, mirificè eram numeris delectatus.” We believe this; we rejoice to believe it. The only unaccountable thing is how this genius for numbers should not have led him to the piano, instead of to the Kantian philosophy;

or how a man, who, in all other things, purposely goes out of the way of the grammarians, should here purposely walk along with them in the same dry, dusty track that had already been the mother of so much confusion? How faithfully does this metaphysical metricalian eschew all converse with rhythm? how does this rebellious son excuse himself for casting off the allegiance to his legitimate sire? He gives in a special plea; let us hear his defence. "Quo in statu nunc res est, nihil amplius scimus quam diversas fuisse rhythmorum doctrinam et scientiam metrorum; rhythmos enim ad musicam et cantum, metra ad poesin pertinuisse: unde intelligimus rhythmum aliquem similitudinem habuisse, cum eo quem hodie tactum musici vocant, etsi aliâ ex parte huic dissimillimus fuerit necesse est."* Ο παπῆ, παπῆ! What sort of monsters were these Greeks! Did the birds bray in days of antiquity, and did the asses chirp? But the reader will observe we have got one step here beyond the wisdom of Burney and the British musicians; we are brought back to the sound doctrine of the old grammarians, that rhythm and metre are not the same thing. We advance also another step; it is allowed that rhythm was a musical thing, and, though not exactly the same as our time, had some striking resemblance to it. Then what was it? why not admit at once that it was the same thing? If you assume any unknown mongrel entity half-way between metre and time, you are bound to give us some tangible idea what this new entity may be. But why make such strange assumptions? why ensconce yourself with such superstitious jealousy against the fellowship of sweet sounds? why raise up presumptions against nature, and difficulties merely to create confusion? There is evidently something crooked and perverse in this whole matter; nor is an Œdipus required to unravel the mystery; the student of German philology knows well how the case stands; Hermann is the head of a school, and Hermann must preserve his consistency.†

* Praefat. Elem. Doct. Met. p. vii.

† The reader will recollect that the celebrated work "De Metris Poetarum Græcorum et Romanorum" was published in 1796, the elements not till 1816. The controversies with *Bothe*, *Apel*, and *Böckh*, had taken place in the meantime. An attention to this will explain not a few peculiarities in the psychology of the Elements. There was also another work in German published very soon after the first work (*Handbuch der Metrik*, 1799). This we have not seen, but it is worth having, as it contains the most open denial of anything like *time* in Greek metres that is to be found in Hermann's works. Afterwards, as in the above extract from the preface to the elements, the matter was smoothed down, to conciliate the change in the

Bishop Stillingfleet is reported to have said of Bentley that if he had only known what the meaning of humility was he might have been a *great* man; so will Hermann go down to posterity as a truly great man, if he have the honesty to throw the prejudices of twenty years behind his back, and confess that Böckh and Apel are more sure guides to the science of metres than Immanuel Kant. But there are few Keplers in the world; and even as it is, there is enough of varied merit in Hermann to command the warm gratitude of literary men, while the past shall teach the future. As to his metrical merits, apart from the blunders of his theory, there can be no dispute; not to mention his exhaustive and comprehensive mastery of detail, the general tone and spirit of his criticism cannot be sufficiently commended. Sometimes, indeed, like all metrical doctors, he is a little too dogmatical, as for instance, when (p. 70) he proposes to expel every pyrrhic from the initial or *start* foot (base) of certain verses; but in general, especially when set against Porson, he is a cautious and a sound critic. In metrical matters, as we shall see below, Porson must evidently be considered as a monomaniac; no other theory can dignify his pedantry, or palliate his puerility. Hermann again rides his hobby moderately, and is loath to allow the tight-drawn laces of the metricalian to smother the free breathing of the man. The minute and obscure diligence of the Porsonians often rouses his wrath; but these men are too small for his serious attention; he treats them in passing with a look half in pity half in scorn, and the mortal feels, when he cannot see, the fleeting presence of a god. "Nostrum est quidem, quum artem quandam doctrinamque harum versuum condimus, ubique regulas et leges circumspicere; sed qui obliviscuntur totum hoc genus in eo versari quod placeat, ipsumque se auribus commendat, non animadvertunt, dum morosas regulas excogitant, plus se scire velle, quam ipsi poetæ sciebant, risuri profecto si viderent quam obscurâ eos et inutili diligentia usos putamus, dum nihil nisi suum sequebantur sensum, aliquando etiam aliquid

taste of scholars which Apel and Böckh had occasioned. Nay, so early as 1815, the great *metricalian* condescended to write that well-known tract on the *rhythmical* measure of certain metres, whose title we have prefixed. But this is not the only contradiction in Hermann's practice. What has the *Trochæus Semantus*, which he foists everywhere into Pindar, to do with mere *metres*? If we understand any thing about them, at least as Hermann uses them, they belong to the art of the musician. A man enslaved by a false theory is like a thief telling how he came by stolen goods,—he is never consistent with himself.

quod non satis placeret, sibi indulgentes.*” Here again we have true eloquence, a sentence almost worthy of Tacitus. Had the small men who employed themselves in the barren labour of making morose rules, by which to fetter the free-soldier genius of an Æschylus, only condescended to borrow this and similar hints from the wisdom of a learned foreigner, they might have saved themselves much sore labour of the eyes, and redeemed English scholarship from the contempt which Porsonian pedantry has everywhere thrown on it. But Hermann was a German, and Porson made witty verses against the Germans; and Burney and Gaisford and Elmsley and Blomfield danced whenever Porson fiddled.

If we had leisure we could select from the Elements of the Doctrine of Metres, a series of sentences which contain in themselves a sufficient refutation of all the Porsonian principles of metrical criticism (if it had any *principle* save that one only of *monotony*) and, in our opinion, are alone enough to overthrow the greater number of the famous canons. We shall select a few. On the erudite puerilities about the Iambic Cæsura, a matter in which, as we shall see anon, Porson himself outstrips, were it possible, the absurdity of his most absurd disciples,—Hermann has the following sensible remark: “Sed critici, parum memores poetarum in hoc genere non aliâ re quam sensu suo duci, ad regulas quasdam revocare hanc Cæsurarum varietatem conati sunt, operâ majore quam fructu. Quorum nos, etsi *non* contemnimus industriam (he meant to say he *did* despise it), tamen quamvis infinitâ multitudinem exemplorum nihil effici putamus, nisi idoneæ rationes eæque ex ipsâ numeri naturâ petitæ afferantur.”† And such a genuine manly contempt had Hermann for the petty cæsural diligence of the English critics, that he would have passed the whole doctrine over in silence, unless he had thereby seemed to acquiesce in the superstitious reverence with which English scholars regarded the inventions of Porson. “Sed ea ne silentio præteream, auctoritas viri facit, quæ apud populares ejus tanta est, ut ab ejus placitis discedere pene religioni sibi ducant.”‡ And in the same enlarged spirit of true criticism he repudiates a small criticism of Dawes, with regard to the metrical accent falling on the last syllable of a hyperdissyllabic word. “Nam nulla est in talibus regulis *necessitas*; sed, quemadmodum rectius in hujusmodi rebus unice id quod auribus probaretur spectabant, ita nos quoque nec repudiare, si quando illi negligenter fuerunt; et videre

convenit an interdum regula sine offensione contemni potuerit.”* It appears to us that every line here breaks not only a Dawesian but a Porsonian canon. And if we are to act consistently on this sound reasoning, not merely the Cæsural drivel must be utterly discarded, but the Anapæst *in pari sede*, must be restored; and Brunck is right after all. We are aware that in regard to this matter Hermann has apostatized from his early opinions, at least as respects Iambic Trimeters Tragic; but we think he has done so against his own reasoning; and in this matter we choose rather to be right soberly with Hephæstion and honest Wellauer, than to err splendidly with a Porson, or even a Hermann. But there were no end of quoting from Hermann such hard clenching sentences, prostrating the metrical follies of the Porsonians. His quiet sneer (p. 578) at those “qui ad *rara* offendent” is inimitable. His dry observation that there are many ways of composing verses, which, though not the most elegant, are not therefore to be suspected of corruption, makes unnecessary nineteen out of twenty of Porson’s “*emendations*.” And if what he says be true (p. 403) that “paucity of examples” is of itself no good reason for declaring any license to be unallowable, unless other good reasons are given, we really do not see on what foundation the greater part of the Porsonian canons stand. But we must leave Hermann. He is undoubtedly a great reformer; he overturned Hephæstion; he withstood Porson; and he prepared the way for Böckh.

The course of historical inquiry now brings us to Porson himself; a strong man undoubtedly, though not a Bentley, and on the subject of metres not wise. Bishop Blomfield says somewhere, when Seidler had presumed to criticize the great Cantab—“De Porsoni, si Diis placet erroribus, a re castigatis magnifice loquitur. *Nempe leoni mortuo vel asinus calcibus frontem exterit.*” Doubtless Porson was a lion, and so was Dr. Johnson; and while he was alive, and ruled the critical world, a sort of god: but now that he is dead, we know well and we say openly that he was in many things a prejudiced old bear. So also with regard to Porson, being free from the living terror of his ban, it may be lawful for any honest man, without dreading episcopal excommunication, to think what he pleases of the Cantabrigian Pope, and to say what he thinks. Our opinion, therefore, is, that the great discovery of the illicit Anapæsts was

* Element. p. 48.

† Element. p. 107.

‡ Element. p. 101.

* P. 107. He might have missed out the *pene*. What he says is literally and absolutely true, as every page of Bishop Blomfield’s Æschylus demonstrates.

no discovery at all; that the grand doctrine of the Cæsura (so far as Porson taught any thing new in it) was sheer nonsense; and the matter of the Cretic ending an ingenious piece of puerile trifling. These propositions we shall prove by a few statements as short and succinct as possible; but, as we hope, abundantly satisfactory to those who have followed our previous observations, and seized the spirit of the quotations we have given from Hermann.

Now in order to ascertain the real value of Porson's canon of illicit Anapæsts, we must look in the first place at how the matter stood, before the great Cantab applied his sedulous hand, to rub and polish all the verses of the tragedians down to one monotonous level. This we find in Hephæstion. "Iambic verse," says the worthy old metrician, "receives in the odd places, *i. e.* the first, third, and fifth, the Iambus, the Tribach, the Spondee, the Dactyle, the Anapæst; in the even places, *i. e.* the second, fourth, and sixth, the Iambus, the Tribach, and the Anapæst; and this with the comedians frequently (*συνεχως*) but more rarely (*σπανιωτερον*) with the tragedians." Hephæstion gives this general and comprehensive rule, in the deliberate knowledge, that the admission of the Anapæsts was something irregular, something that ought not to be, *οὐκ οφείλει γενεσθαι* (*ibid*); and he repeats the same thing in the following chapter. He is also perfectly aware of the license of proper names, which he had mentioned in the preceding page (c. iii.) under the name of *ονοματων αναγκη*. The attempts of the Porsonians to get over this passage are therefore complete failures. Hephæstion makes a plain intelligible statement of fact, and with full consciousness of what he is about. The only resource is to scout the grammarians' authority in this matter, as Burney did in the matter of mangling the verses; but Hephæstion, though he may be a very bad philosopher in determining the nature of asynartete and anti-pathetic verses, is a most unexceptionable witness to a mere matter of fact, which he had better means of ascertaining than any modern can pretend to. He must, for one thing, have had a much wider range of Greek plays before him than we have; and in the next place he must have used manuscripts, whose authority was far superior to any, the very best we can now produce. Why not therefore in a petty and unimportant matter of this kind, take the laws of Iambic verse, as free and liberal as the honest old metrician gives them? What is the monstrous offence of a stray Anapæst here and there, that a deliberate persecution should

be instituted against them, and the glory of a new metrical school founded on their utter annihilation? Does the Anapæst render the verse inharmonious? So Porson seems to have assumed; prove it he could not. But if the Anapæst renders Iambic verse inharmonious, why not the Spondee, or the Dactyle? There is no answer to this; and we are therefore told that as the Anapæst is merely a surrogate of the Spondee, it can only come into those places of the verse where that foot is admitted. But this is merely repeating Hephæstion. Hephæstion knew all that philosophy of Iambic quite as well as Porson; and yet in the face of his own philosophy he states a fact, which, could he have ever anticipated the modern controversy on this minute theme, he would doubtless have established by sufficient examples. But our modern metricians, perceiving a beauty in monotony which Hephæstion, who had not read Pope, could scarcely have understood, proceed to make obstinate facts obedient to their philosophy in a manner which they who do not understand Greek, may collect from Bentley's edition of Milton; and this they do in a slump undistinguishing fashion, which, as we have already said, looks more like *monomania* than rational criticism. They first publish a presumption against all Anapæsts, which does not exist; and then they set their ingenuity to work by help of blundering codices, grammatical figures, and other ready tools of that sort, to smoothe down every irregularity, that may here and there accidentally disturb the "regular Jew's harp twing twang" of Greek Iambics. It may easily be conceived that this is no difficult matter; for Anapæsts, as Hephæstion tells us, are rare, and variations in the codices are frequent, and grammatical figures are abundant, and the ingenuity of critics is great. We do not indeed require Greek to understand this great mystery; we do not require to go to Bishop Blomfield's *Æschylus* to see Porson's levelling system of metres in full operation; we have had a set of critics in this country (and some of them exist still) who have exhibited the same sacred horror of trisyllabic feet in our blank verse, that Porson has shown against the Anapæsts in Greek Iambics; and how the finest lines in Milton (not to mention Southey, Wordsworth, and Coleridge) have been smothered and mangled by this curious race of syllable counters, no student of English poetry requires to be told. These critics, whether Greek or English, never seem for one moment to imagine that variety is an element of the beautiful; that irregulari-

ty may sometimes be a beauty ; that the most careful poet may sometimes write carelessly ; that the dramatic effect and expressiveness of a metrical foot is more considered by a true poet than a stiff pedantic rule ; and that the same unbending laws are not to be applied equally to measure the smooth respectable verse of Sophocles, and the more muscular and hardy lines of Æschylus.

But what a piece of paltry pedantry is this whole affair ! Supposing an anapæst *in pari sede* to be something like a bad rhyme in modern verse, may not a long poem be written with only one bad rhyme in it, and is this one bad rhyme therefore to be declared corrupt by the critics, and forthwith emended, according to the ingenious whim of a Porson, or a Blomfield ? Would not rather that critic be esteemed a poor trifler, who should employ himself in hunting out these few stray irregularities, and devising ingenious methods by which they might be expelled ? We must candidly confess that not only the matter of the Anapæsts, but also many minute laboriosities of the Porsonian school, appear to us in this light ; and we have on this account never been able to share in the general admiration which has been expressed for that famous preface to the Hecuba. That performance shows a singular sort of minute diligence, but it is utterly destitute of intellect ; and when set against Böckh's *Dissertatio de Metris Pindari*, Hermann's *Doctrinae de Metris*, Apel's *Metrik*, or any other standard German work on this subject, makes our English metrical science appear dwarfish and contemptible indeed. What has been the mighty result of this canon of illicit Anapæsts, even supposing it be perfectly made out ? The greatest Hellenist of his day has succeeded in proving the Iambic verse of the Greeks to be in some respects less various and less noble than our own blank ; a discovery which impartial men might have made long ago ; but Porson has forced it upon us ; and it has now become manifest to all. Monotony is the main fault of the Greek Iambic verse of tragedy ; and we owe it to Porson and his school that this fault has been systematically exaggerated into a virtue. But it is not only the regular recurrence of certain feet that makes the Greek tragic verse monotonous ; it is the cæsural uniformity yet more to which this radical defect is owing ; and here also, as we shall see immediately, Porson stood forward as the prophet of monotony, and did all that lay in his power, with a most indefatigable zeal, to make bad worse, and change what was too common into what ought to be universal. But are we bound to follow a Blom-

field, or a Gaisford, in the forging fetters for the ancient tragedians yet more strong than what they actually wore ? Are we bound, because Porson's intellect was gigantic, to make a worship of the workings of that intellect, when falsely employed on subjects the most puerile and trifling ? Are we bound to pilgrim a thousand miles for the nail of a saint's little finger, and not know whether it be the genuine finger after all ? For even thus it is with Porson's Anapæsts. Our minute study of the letter of the Greek drama is worse and more barren than the basest Roman superstition. After what Hephæstion has said on the subject, and considering the state of the MSS., no man can know with certainty, or even probability, whether Æschylus used an Anapæst in a certain place of a certain play, or not. This much, however, we know, that unless we set ourselves violently and recklessly to abuse the text of the MSS., a good decade of very respectable Anapæsts, not in the first foot, and independent of the proper names, will still remain in the text of Æschylus alone. Vulnerable they doubtless may be, as other things are, but let them only have fair play, and they will stand against a million.* Wellauer, a sound, cool-headed, sensible critic, has for the most part retained these Anapæsts ; and who shall say that he has done wrong ? If the authority of MSS., be doubtful, the authority of conjectural criticism, proceeding upon narrow mechanical principles, is still less. The traditionary text is at least something stable to refer to ; and if we are uncertain whether any particular Anapæst was written by Æschylus, we are certain that this Iambus, or that Dactyle, was written by Porson.

So much for this minute matter ; which of itself is a sufficient sample of the character of the English metrical school founded by Porson, of which the preface to the Hecuba is the charter. But the matter of the cæsuras is yet more characteristic ; the canon in this case not only tires our ear with uniformity, but confounds us with extreme

* 1. Εκατοντᾶκάρηνον προς βίαν χειρουμένον
Τυφωνα θούρον πασὶν ὃς ἀντεστή θεοῖς.

10. Καὶ στερν' ἀρασσαί, κατ' ἑβδὰ το Μῦσιον.—*Id.* 1011.

We do not warrant this list as complete. All the readings are Wellauer's, except Nos. six and seven. For these we reserve a special plea ; as indeed more cogent grounds than the mere authority of MSS., exist for the most of them.

absurdity. To enable the English reader to get a clear idea of this great mystery, we shall present the first lines of Southey's Roderick, divided on the principles of uniformity, which was the soul and substance of Porson's doctrine of Cæsura.

"Long had the crimes of Spain cried | out to heaven :
At length the measure | of offence was full.
Count Julian called the invaders | ; not because
Inhuman priests with | unoffending blood
Had stained their country | ; not because a yoke
Of iron servitude oppressed and galled
The children of the soil ; a | private wrong
Roused the remorseless | baron. | Mad to wreak
His vengeance for his | violated child
On Roderick's* head, in evil | hour for Spain,
For that unhappy | daughter | and himself,
Desperate apostate, | on the Moors he called ;
And like a cloud of locusts, | whom the south
Wafts from the plains of | wasted Africa,
The Mussulmen upon Iberia's shore
Descend."

The laws by which the verse is thus divided are few and simple. The first is an utter disregard of the sense ; the second a superstitious shunning of variety ; and the third is an ingenious dragging of small unimportant words from the part of the verse to which they naturally belong, and tagging them to the tail of that part of the verse, to which they do not belong. All the verses which have not the above cæsuras naturally, and cannot be made to assume them by metrical process of dislocation, transposition or otherwise, are inharmonious ; and, *pari ratione*, whatsoever verses have both these cæsuras are doubly harmonious. Whatsoever poet scrupulously observes these cæsuras is a great master of the art ; whosoever neglects them frequently is a bungler. Therefore Virgil is a more perfect poet than Homer : Æschylus in this, as in so many other things, is far inferior to Sophocles or Euripides. There is further a singularity attending the recitation of verses so divided, which the classical scholar is enjoined sedulously to attend to. It is as old as Bentley, and has received the sanction of Dawes, and the stamp of Porson. This singularity consists in giving to the Iambic verse on all possible occasions a Trochaic movement ; which movement the reader will observe is discernible immediately after the division of the verse, whenever that commences, whether at the beginning of the third or the fourth foot. Bentley commenced this movement invariably on the second syllable of the verse ; and this he did by cutting off the first syllable, and making the verse headless, *ακεφαλον*, as the metricians phrase it. If Bentley had done this on the principles of modern music, in which the bar always commences with the strong part of the

movement, his doctrine would have been intelligible ; but he states distinctly that his object, in this procedure, was to come down with the more marked emphasis on the cæsura ; in fact, as he himself states, he had got into this metrical sing-song when a boy ;* and as there was probably no master of elocution in Cambridge at the time when he was going on with his Greek studies, the fault was never corrected, and he gave it out as a great discovery in his preface to Terence. Hare greedily seized upon this, as on some other Bentleian ideas ; but Dawes was more tough, and he allowed the Trochaic movement to begin only after the pause of the voice at the cæsura. This doctrine occupies to the present day a distinguished place in the books of the Porsonians (see Tate), and is indeed of some importance to the theory of cæsura as understood by these men. It proves distinctly that they hold the cæsura to be a sort of pause, or a real pause,† and not a mere incision ; and with this it proves also, beyond redemption, the absolute absurdity of the cæsural canon. If the reader is to make not only an incision, but also a pause after the cæsural syllables in the above example from Southey, the barbarism of the elocution becomes manifest. We are unwilling, however, to charge this tasteless puerility on Porson himself. Perhaps he had nothing else in his eye but the mere articulation or inosculation of the verse at a certain place ; this was enough for him as a mere metrician, to whom sense and poetry and music

* Apel (vol. ii. Vorrede, p. xvii.) states the matter more charitably for Bentley ; he says he brought in the "*Auftakt*," or start syllable from music. We shall be glad to think that we are wrong.

† Cleaver, *De Rhythmo Græcorum*, p. 42, puts a *minim rest* after every cæsural syllable ; for which ignorance he has received merited chastisement from Böckh, p. 98.

* Anapæstus in secundâ sede. Lege Roderick, R. P.

might be alike indifferent. But even taking it thus, his doctrine of the cæsuras is a clear monomania, and not to be explained on any other principle. That the Greek dramatists delighted much in the penthemimeral and hepthemimeral cæsura was a fact well known before Porson's day. And it is also a fact that this cæsura, in which they delight, is often not a mere articulation of the words of the verse, but it is the veritable pause, in the variety of which the great beauty of Milton's organ measure consists. Now the constant repetition of this cæsura was manifestly a great fault in the Greek Iambic; and had Porson been a man that understood the living laws of poetry, instead of a mere metrical uniformity. He would have shown how many of the penthemimerals and hepthemimerals are not real cæsuras, but only joinings of the verse, accidental in some measure, and in some measure dependent on the syllabic character of the Greek language. But Porson aimed at nothing but metrical uniformity. He had only one eye; and that eye spectacled by a lens compounded of the narrowness of grammatical formalism, and the monotony of the Popian versification. Hence such absurdities as the following:

Αλλ' οὐτ' ἐμοὶ καλὸν τοῦτ' | ἐστὶν οὐτε σοί.
Soph. Phil. 1304.

A forced hepthemimeral to a line which should have been divided thus:—

Αλλ' οὐτ' ἐμοὶ καλὸν τοῦτ' ἐστὶν | οὐτε σοί.

And this—

Αλλ' ὅν πολὶς στυγεὶ σὺ | τιμῆσαι ταφῶ.
Æschyl. Theb. 1055.

which should have been divided into two equal halves,* and the same with many other verses; absurdities so glaring, that a sound-headed English scholar will hardly be brought to believe that they could ever have been seriously propounded by a sane man; much less by one of the strongest intellects of the day. Porson, however, could afford to be mad on one subject; but how the in-

tellect of England could afford to repeat such nonsense up to the present hour, and that without a single voice of dissent, is to us altogether incomprehensible. Hermann's nonsense was at least sublime and intellectual; but the doctrine of the cæsura is sheer drivel, unredeemed by one smothered spark of thought, or the wandering shadow of an idea. Elmsley wasted a fine intellect in puzzling himself to reconcile the practice of the tragedians to Porson's rules; in striving to explain how verses that Porson had pronounced inharmonious, might, nevertheless, be made to read as if they were composed according to the strict rules of the canons; in endeavouring, as plain English must have it, to put sense into nonsense. And will the intelligent reader believe that after all this portentous machinery, the very best verses in Æschylus are precisely those which ran quite counter to the Porsonian cæsuras? Take the opening lines of the Prometheus, and see how many out of the eleven have the penthemimeral or the hepthemimeral division, and whether those that have this division be for that better or worse than those that have it not. The prologue runs thus:—

ΚΡΑΤΟΣ.

1. Χθονος μὲν εἰς τηλοῦρον | ἤκομεν πέδον
Σκυθὴν εἰς οἶμον, | ἀβάτον εἰς ἐρημίαν.
Ἡφαίστε, | σοὶ δὲ χρὴ μέλειν ἐπιστολας
'Ας σοὶ πατὴρ εἴπειτο, | τόνδε πρὸς πέτραις
5. ὑψηλοκρημνοῖς | τὸν λεωργὸν ὄχμασαι
Ἀδαμαντίνων δέσμων | ἐν ἀρρηκτοῖς πέδαϊς.
Τὸ σὺν γὰρ ἄνθος, | παντεχνοῦ πυρὸς σέλας
θνητοῖσι κλεψας ὥπασεν' | τοιαῦτά τοι
Ἀμαρτίας, | σφεδρὴ θεοῖς δοῦναι δίκην
10. ὥς ἀν' διδάχθῃ | τὴν Δίος τυραννίδα
στεργεῖν, | φιλανθρώπου δὲ παύεσθαι τροπῶν.

Of these lines, when read naturally, and not according to the artificial dislocations of Porson, the third, the sixth, the eighth, the ninth, the eleventh, have neither the penthemimeral, nor the hepthemimeral cæsura; and we assert that of these five the two, that can by no possibility be screwed into conformity with Porson's cæsuras, viz. the sixth and the eleventh, are precisely the two best lines in the set. Whether Sophocles or Euripides ever wrote such a line as that last,

στεργεῖν, φιλανθρώπου δὲ παύεσθαι τροπῶν,

which has the pause after the first foot, and no inosculation of the final syllables of the words, we neither ask nor care. It is a strong, nervous, manly, soldier-like line, every word; one of the very best in Æschylus undeniably; as is also the sixth, though it has two Spondees, and an Anapæst. But the metrists tell us to avoid such lines, because they are not "*jucundi*;" not pleasant

* On equi-divided lines the student will find some admirable remarks in the metrical appendix to Gruppe's Ariadne, p. 778.

to academical ears. To be consistent, they should tell us to avoid Milton also; to castrate every thing sinewy, muscular and masculine in language; that we may be cradled for ever in some child's heaven, to the sweet lullaby of Porsonian sing-song.

On the other matter of the Cretic ending our limits forbid us to expatiate. That was a sort of original discovery, though merely verbal and syllabic, like all Porson's metrical canons. We shall say however shortly how this matter stands. 1. The Porsonians have never yet been able to give a consistent definition of what the Cretic ending is; some holding a pause or break in the sense to be necessary to constitute it, some going merely on the number of the syllables in the two final words. 2. Those who say a pause is necessary bring examples under the rule, where there is in reality no vestige of a pause. 3. The exceptions to this rule are not few; and the ingenious triflings by which they are attempted to be reconciled are not satisfactory. 4. The rule depends partly on no principle—5. partly the principle on which it depends has not been evolved.* 6. The rule is

* We think the matter of the Cretic ending has generally had its poles reversed. The question ought not to be put, how and why does the Cretic ending exclude a Spondee in the fifth foot, but how do the Spondees in the fifth foot for the most part exclude the Cretic ending. If the student will look into the matter, he will find that the Spondaic fifth foot, is generally and naturally formed by a Molossus or Epitrit—*πανεσθαι, φιλανθρωπον*—feet peculiarly abundant in the flexions of verbs, and in all compound words. These words could not be put into any other part of the verse in consistency with the two cæsuras, for which the tragedians had such a foolish partiality; consequently, as often as they occur, and that from the structure of the Greek language could not be seldom, the sixth foot must be a dissyllabic word. We must bear in mind further that the Spondee in the fifth foot was not the general close of Iambic verse, but useful, particularly, for lines of peculiar strength and weight, such as the genius of Æschylus demanded, and the structure of the language not seldom forced; and the Spondaic closes being naturally exhausted by their use in such cases, there would be little occasion for using them in other cases. The fifth-foot Iambus is the general law, and the Cretic termination presented a favourable disposition of the syllables for that Iambus. This (which we propose, we believe, for the first time, as a fancy of our own) taken along with the greater harshness of the Spondee in any situation when divided between two words, and the natural purity of every metre at its close, sufficiently explains the peculiarity of the Cretic ending. It has been remarked also by Müller (*Eumenides Anhang*), that the Cretic endings are very few in comparison of the dissyllabic; a dissyllabic word forming, in Greek as in English, the most natural and easy final foot of Iambic verse. What wonder then that a Spondaic fifth foot seldom occurs before a final Cretic?—It was a thing in a great measure accidental, and arising out of the structure of the language and the natural flow

either useless in criticism, or positively pernicious—useless, if no sound critic will apply it as a rule in fixing the text; pernicious, if unsound critics, such as the Porsonians are in all metrical matters, use it as an instrument for mangling and corrupting the diction of the tragedians.

We shall readily be excused by the intelligent reader from entering into these minute matters at greater length. The importance which they have acquired in the literature of English scholarship was in a great measure factitious, and could not but be ephemeral. We are willing to grant all the other canons of Porson to be true, (though Hermann has manfully opposed the greater number of them); but the character of his metrical school will gain little by this concession. What determines the character of that school is a certain narrowness of intellectual vision, and aridness of poetic sympathy—a narrowness that belongs more to the letter than the spirit, and holds com-

of the verse. Something similar may be observed in English verse; and had not the Porsonians been so bent on the ground with their one small microscopic Greek eye, they might have found long ago, that the principle of Cretic ending is a common accident in all verse, containing nothing marvellous, and nothing worthy of special canonization. We will venture to say, that any person with an ear tolerably tuned to Greek tragic verse, and with a full flow of Greek at the end of his pen, will avoid the Cretic ending (so far as it ought to be avoided), by poetic instinct, as completely as if he had written all the while in bodily fear of the Porsonian canon. The gross absurdity of this, as of the other canons, is this, that Porson placed it upon no principle; and as he could give no reason for the rule, so he could give no reason for the exception; and in this case the only way left was to make the rule absolute, and score all exceptions. The servility of Elmsley and others in bowing the knee to the infallibility of the Porsonian canons is and remains one of the chief stigmas of British scholarship. Mr. Tate, (*Metres*, p. 30,) for instance, reads the first line of Euripides' *Ion*

Ἀτλας ὁ νωτοῖς χαλκεοῖσιν οὐρανόν;

And then coolly remarks—the old reading was,

Ἀτλας ὁ χαλκεοῖσι νωτοῖς οὐρανόν.

Where the student will understand that the *old* reading is the reading of the MSS. and of the best German editions, (Matthiæ,) and the reading is Porson's reading, effected by an ingenious process of *transposition* peculiar to himself. We could write a whole half hour on this matter, small as it is. Porson was a man of strong talent, if not real genius; and we have considered it due to the high station he deservedly holds among the scholars of this country, not to speak lightly of any part of his Hellenic labours, without having given the subject serious study. But we declare at the conclusion, as we did at the outset, that the whole matter is trifling and puerile in the extreme; pure monomania; minute grammatical pedantry unenlightened by a single ray of intellect. Porson was a giant; but if a giant choose to play with dolls, that is no reason why we, who are free men, should baptize them gods, and slavishly bend the knee before them.

munion with the dead rather than the living. And with regard to the doctrine of metres in particular, our great error seems to have been the application of the Baconian method of external induction to a subject, the laws of which must be evolved Platonically from the inward fountains of spiritual emotion. We have, however, advanced a step or two in matters of philosophy within the last twenty years. The battle of Jena taught the soldiers of Frederick that men cannot be drilled into patriotism; and the decline and fall of the Porsonian school has taught English scholars that a living literature cannot be manufactured. Even the genius of a Cuvier out of dead bones could re-construct a gigantic frame-work of bones only; no man can gather together and pile into a heap the materials out of which a soul is composed; what we cry out for in this country is a *soul* to our Greek scholarship; for the kingdom of literature, like the kingdom of God, is within us.

After what we have said of Porson, no person will expect that we should detain ourselves one moment with the other "magnanimous heroes" of the English metrical school. Burney and Gaisford are the only two notables; but Burney's "sick dreams" have been often enough honoured with all the attention they deserve, a passing smile;* and Gaisford does not aspire to any higher praise than that of a diligent editor and an honest compiler. Honest, however, he is, and free from dogmatism—a great praise; for though not inferior either to Kidd or Elmsley in servile admiration of Porson, he has too great a respect for antiquity to slash away every characteristic irregularity that may unfortunately present itself. Even the Anapæsts he seems half inclined to spare;

"*rarissime vel nunquam*" is his modest sensible phrase in regard to this matter, when nothing but a "*delenda est Carthago!*" will please his more orthodox brethren. To the student of ancient poetry Gaisford's Hephæstion is the most useful of all books. If a man has learned thought elsewhere, he may find abundant materials of thinking here.

We now return to Germany, and there, as usual, "the preparatory blast of cow-horn" meets our ear, while all is peaceful, and asleep in England. Hermann is as mighty among the philologists there as Porson is in England. In metrical matters he is sole dictator; even Heyne gives over his Pindar to him, and allows him to cut and carve the Scholiast's dipods at his pleasure. But matters are not to remain so long. The Church-philologic is to be reformed, and that reformation, like many others, is not to come from within but from without. Not doctors of the law and learned Rabbis preached the Gospel of Christ, but a few ignorant fishermen: thus also, to compare profane things with sacred, the great reformer of the scholastic doctrine of metres was not a schoolman but a private individual, a mere amateur in Greek, a solitary thinker, an ingenious philosopher, a poet, a musician, a true German. This man was August Apel, to whom the literary world is indebted for the first systematic exposition of the theory of metres on musical principles with special reference to the Greek choral poetry. So early as 1806, in the appendix to an antique drama (the *Æolians*) published by him, did Apel begin to place the theory of ancient metres upon its only sure basis, the living realities of music; and that these speculations had their due effect in influencing the intellectual philologists of the day is evident from the open and generous confessions of Böckh, who never attempts to deny the great and original merit of Apel. He says indeed that he was led away in his earlier studies by Apel's use of the dotted notes or the triple quantity; but we have seen above that Böckh only half rejects the triple quantity, or rather he only rejects the triple proportion of one note to another composing a rhythmical foot, not the triple duration of one single note, or even of two single notes together, which would make a legitimate spondaic bar. Besides it is not the mere detail of the matter wherein Apel's great and original merit consists; his principle, the scansion of Greek poetry musically, not metrically, at once stamps his character, and gives him his value; this principle was the soul which he breathed into the dead bones

* See the testimonies of the great continental scholars in our 44th Number, in the article previously cited; to which we have great pleasure in adding the following English testimony from the *Classical Journal*, vol. iii. and iv. so early as 1811. The passage occurs in the papers on the metres of Anacreon above quoted. "One absurdity will ever beget another. Thus the established prejudice that all lyrical compositions are in some *metre* or another (as opposed to musical bar or rhythm), has imposed a task on the authors of this opinion to find a name for their supposed metre, and to effect this they have destroyed all distinction and propriety of words, and have so confounded feet together, that I hardly know what combination of rhythm is safe from their overwhelming Dochmiacs and Antispasts. There is a curious table in the *Tentamen*, p. 12, which exhibits no less than sixty-one forms of one foot, namely, the Antispastic. But this in a matter where a certain guide is so much wanted, is to give us nothing better than a Proteus and a Harlequin. *To be serious, it is time that this rubbish were removed, which is only a burden to the memory, and gives no light to the understanding.*"

of metrical learning ; the declaration of war which he cast in the teeth of ancient scholasticism. His apparition indeed is altogether polemical ; he knew that he had a host of enemies to contend with ; he comes forth panoplied with the front of a prophet, and, soldier-like, with the sword of truth cutting sharply ; he gives no quarter, for he knows that none will be given ; he hits hard, and with reiteration, for he knows there are men in the world who will not receive truth, unless it be driven into them. Hence the somewhat bulky shape with which his speculations have clothed themselves ; two *strong* volumes (as the Germans say) and the work still imperfect, for the author died in 1816 before its completion. But he lived long enough to see the good work which he had begun progressing rapidly. He saw Böckh raising an architecture which must last for ever, because it was built on the foundation, though not altogether on the same plan, that he had pointed out. His doctrine, under the name of the "Time-theory" (*Takt-theorie*), had shaken the whole learned world of Germany ; he had divided all the students of ancient literature into two sects, those who held by Hermann and those who held by Apel ; he had brought even the "grammarians" to a tacit admission, if not an open avowal, of his main doctrines ; heavy and nimble Dactyles (common time and triple) were now openly talked of ; empty times and pauses received a free admission ; even the crabbed metaphysics of Hermann were moulded into something like a musical shape. He had reason therefore to count himself happy beyond most original thinkers and discoverers of great truths, whom the world is wont by an old and approved custom to neglect during life, and canonize after death. Apel was happy in being a German. The "nation of shopkeepers" turned a deaf ear to the musical charmings of Steele and Chapman. John Bull had not been accustomed to connect crotchets and quavers with anything beyond the mere momentary titillation of the ear ; their application to the philosophy of spoken or written language appeared something new and unheard of ; the vulgar received this, like all higher philosophy, with a smile ; and the critic, who ought to have been the leader, not the slave of the public mind, showed at once his wisdom, and his ignorance, by silence.

Like every other man of warfare, Apel did not keep altogether free from one-sidedness. He comes plump in upon the ancients with all the machinery of modern music ; a procedure which peculiarly exposed him to the raillery of his philological adversaries,

whose favourite tactics now became to sneer at this unlearned jumble of modern and antique, and to hint that ancient music was something so very different from modern, that none but a hot-headed bungler could confound them. It seemed wise in Hermann and his school to hold themselves back from a region of perplexity, where Burney and Forkel, and so many brave spirits, had floundered. Narrow-laced scholasticism showed now like calm, cautious, surveying, philosophy ; and a tone of superior wisdom and discernment was assumed in the preface to the "Elements of the Doctrine of Metres," to which the name of Apel would have been a discord. But all this was in vain. If we understand little of the ancient rhythmopœia, we understand less of Hermann's system or Burney's, for they are absolutely unintelligible ; and it is surely better to chant a song of $\frac{5}{8}$ in $\frac{6}{8}$ time than to wrench and dislocate the most beautiful verses of ancient poetry into no time at all. The fact of the matter is, the philologists were wroth to see the musicians interfering with their hereditary wisdom ; they looked upon the "time-theory" metricians as a sort of Nazarenes preaching new gods—wild, savage, bare-headed men, not sitting on the seat of Moses ; and though they could not aver that their own doctrines had more of spiritual and regenerating influence than those of the street-preacher, yet they were certainly more orthodox, more ancient, and more respectable. But this Pharisaic jealousy was of small avail. A great crisis was at hand. The synagogue was destined to be evangelized from within ; a great Apostle came forth from the secret council of the Gamaliels. This Apostle was Augustus Böckh.

Between Böckh and Apel, in respect of their services to the science of ancient rhythm, the difference is shortly this—Apel put a soul forcibly into antiquity, Böckh drew a soul quietly out of it. The result, as the musical man may guess, was pretty much the same in both cases ; for music is not a thing of yesterday, or to-day, but for ever. Böckh's method, however, had this manifest advantage, that while convincing the theorizers, it at the same time silenced the matter-of-fact men, who were many, and very willing to gainsay. When a man prostrates us with our own weapons, and on our own battle-ground, then we are vanquished indeed. Who could deny the erudition, the pains-taking laboriousness of the editor of Pindar ? It was impossible to *ignore* him. He was a veritable scholar ; an *ἐπὶ λέξει* of the true German school ; an accurate and minute Hellenist as any Hermannian or Porsonian might wish ; a regular v. ci-

plined philologist. Hence, when he came into the field one of the two alternatives was necessary—submission or war; his doctrine must either publicly triumph, or be publicly confuted. The new recension of the poems of Pindar was given to the world in 1811; and from that year to the present there has been dissension and strife in the ever-busy world of German scholarship. The eighteenth century is at war with the nineteenth, and will not be reconciled. Is there any wonder here? Even Göthe could not understand the battle of Leipzig; is it strange if Hermann should not understand Böckh?

The great superiority that marks Böckh over all men who have hitherto applied themselves to the subject of ancient rhythm seems to lie here: he is not only a profound and thorough scholar, but a living and real Platonist. The beautiful is his proper and native element; every thing in him and about him is rhythmical and well ordered; he had a clear vocation from nature to do what he did; his dissertation on the metres of Pindar is a work of genius. In this country the bare name of prosody has become odious to living men; and deservedly so, for it was a mere skeleton; but the dry and dusty materials of the metricalian's workshop are transmuted by the plastic intellect of Böckh into the elements of a breathing world; all glaring points, all harsh jagged promontories, all huge disjointed fragments, are here tempered and harmonized into a living landscape, bosomed in beauty, and atmosphered in music. So lovely a thing it is, and so satisfying, when a man does that thing, and that thing only, which God gave him the faculty divine, and the command to do.

Böckh has done two distinct services to the science of Greek music; of one of which only the present writer pretends to judge. He has shown in the first place how in perfect consistency with the fragments (for they are but fragments) of ancient musical knowledge that we possess, a clear and satisfying doctrine of ancient rhythm may be evolved. He has reconciled learned tradition to the instinct of untaught healthy nature; and in this reconciliation we may feel assured that the genuine truth lies. To a man of perfect spiritual soundness indeed, and strong faith, no learned tradition of a misunderstood or half-understood antiquity can ever prove confounding; whole libraries of Babylonish erudition will not deafen to him the one still voice of nature in his own breast; he can quietly look a whole conclave of Sorbonne doctors in the face, and baptize their most vaunted wisdom a portentous lie. But there are weak men in the world who must lean upon the crutch of tra-

dition; and upon the faith of some misunderstood doctrine of some misunderstanding grammarian, obstinately believe, and teach men to believe, that the rhythm of the Greeks was a systematic St. Vitus dance, and the most harmonious flow of their measures a succession of studied spasms. To the aid of such men the erudition of Böckh comes; and they who are not satisfied with the part certainty, and part reasonable probability which this erudition supplies, show a determination to caricature antiquity that would not be overcome, though Aristotle and Aristoxenus should rise from the dead to convince them.

The other service which Böckh has done to ancient music is in the matter of the scales. In this department the results brought out by Burney were almost as unsatisfactory, though not so perfectly absurd, as his doctrine of rhythm. It seemed strange that so refined and so thoroughly musical a people should have harped and fluted for ages, and never brought out any thing but a minor key; it seemed unintelligible that so much talk should be made of the virtue of modes, and yet these modes be nothing but an ascent in the scale of sounds, not a change in the musical relation of the intervals. These results were too meagre to meet even the bare faith of English sobriety; it was therefore to be expected that, so soon as sufficient musical knowledge should unite with thorough-paced scholarship in the mind of an enthusiastic, and because enthusiastic, indefatigable and indomitable German, this whole theory would be rejected. By private and independent thought (as he himself tells us) Böckh arrived at similar results on the subject of the Greek scales to those of our own countryman Sir Francis Stiles.* Can we esteem such a coincidence accidental? Let those who are learned in the theory of Music, in Chladni's Acoustics, and in Ptolemy's Harmonics, answer this question. The matter is not unworthy of a few hours' quiet thought from a man, who is both a philosophic musician and a profound Hellenist. Those who are not so gifted will follow the wise instinct of nature, and let the matter alone.

There are several details in Böckh's system which we had noted for discussion; but such a throng of matter has gradually accumulated on us in looking into this very interesting subject, that we have been obliged to confine ourselves throughout to a bird's-eye view of the whole. But it is well for a man to know the general bearings of his whereabouts before he proceed to a minute

* In the year 1760. Burney, 54.

trigonometrical survey of any particular region; and if by the above observations we have been able to bring one student of Greek poetry from Burney and Gaisford, to the piano-forte and the fiddle, we have done a great thing. "BEGIN YOUR THEORY WITH THE PRACTICE," as Zelter said to Professor Wolf, and you will anticipate truth at every step, and require no Ariadne's clue to lead you out of a labyrinth, into which you have never entered. We are also much concerned about another thing. We wish that the old wall of partition between German and English intellect, as in polite literature it has already fallen, so also in matters of scholarship, may once and for ever be broken down. Literature, like true religion, is an universal humanizer; there is neither Jew nor Heathen, Englishman nor German, in this spiritual kingdom, but a new creation. Have we English become at length convinced of this truth, that the Germans surpass us as much in the domain of abstract thought, and in the region of the beautiful, as we surpass them in practical philosophy, and in the skilful handling of all that multitude of important externalities, that are weighed by ounces and measured by inches—our course is plain. Let us go to them to learn philosophy, and let them come to us (as they are coming) to study the science of government, and the mighty magic of the steam-engine. A more reasonable exchange could not be. For a German is the complement of an Englishman, and an Englishman is the complement of a German; and both together make the perfect man.

A third thing has struck us forcibly in surveying this singular history of metrical literature; and that is the strange and almost incredible pedantries that have grown out of the neglect of music as a practical pervading element in modern education. We think the time is now come when every honest citizen is bound seriously to set hand to work in reforming this matter; in bringing back our juvenile training to the healthy state in which it was in the golden days of good Queen Bess, when no person was accounted a gentleman who did not play on some instrument;* in removing by one mightiest engine of healing Nature the reproach of shop-keeping and money-making from our people. Or, does any modern man perhaps imagine that the excellence of his nature consists in the understanding merely? Are our emotions of no value?—or do they require no cultivation? Can a man ham-

mer leather or stitch rags together by instinct? and shall the pulses of Promethean fire within us not freeze in this hard world, and become dry and stiff, unless fresh fuel be constantly administered by kindly hands, with daily exposure to the friendly fannings of congenial inspiration? Mr. Bulwer somewhere says, with no small discernment, that "the difference between genius and talent lies more in the heart than in the head." A truly great man is great not by perspicuity of the cognitive faculty only; for intellect, *per se*, may scan clods as well as stars; and a prying, microscopic creature, without any higher motive than mere curiosity, shall wander into a dark, mouldy corner, green with liverwort and adder's tongue, as soon as into the broad sunny world; and it may be with preference. It is the breadth and depth of emotion within a man that makes him truly either good or great; all noble actions, all inspiring thoughts, all sublime creations are begotten originally of, and end in, emotion, as the very proper essence and life-blood of spiritual existence. As respects the emotion of reverence, this is universally recognized: even the French are cured of their old atheism; and no sane man, in the nineteenth century, dreams of establishing a system of national education apart from religion. What shall we say then to the coldness of our schools and colleges—to the unfriendliness of our whole national existence as respects all other emotions of the soul, and that divinest emotion of music in especial? The prose of the times is really very broad; and it is a prose which even that universal panacea, the Penny Magazine, cannot convert into poetry. There is only one remedy. We must cast our juvenile education in a new mould; we must throw off all scholasticism as a heavy rusted harness, that clogs but does not defend; we must teach the living plant to grow, not load the brain-chamber merely with volumes of barren memories; our classical scholarship must no longer be a crust within which an academical creature, half alive, curiously creeps; but we must turn it into a sword, and fence with it and fight manfully against the world, the Devil, and the flesh, and all other enemies of God and good things.

"*Der Jüngling soll die Flügel regen,
In Lieb und Hass gewaltig sich bewegen.*"

So did an old Greek youth at the Olympic or Nemean Games, when Pindar sang his virtue and his strength; and so should we also do, if we would follow Nature and listen to Aristotle, who, discoursing somewhere in his Politics about education, tells us, that the principal matters of the *paideia* are three

* And, indeed, much later than Queen Bess, as the reader will find by consulting Mr. Dauney's edifying dissertation on the History of Scottish Music prefixed to his edition of the Skene-tis melodies.

—Gymnastics, Music, Letters, and some add a fourth, Design (ἡ γραφικη). And he tells us also, in the same place, that an exclusive attention to one subject in the years of the παιδεία is by all means to be avoided, as it tends to cramp the mind, and prevent the free expansion of the vitalities. Now, if Aristotle were to rise from the grave to-morrow, would he not in all probability be surprised, and very reasonably, at many things in the conduct of our juvenile training, and especially in the matter of what is termed classical education? Would our Greek and Latin grammaticalities be likely in any degree to answer his idea of "Letters" (γραμματα), and the benefit to be derived therefrom? Might he not rather be apt to ask us, why, with all this prate about the letter of Greek, our young men for the most part know so passing nothing either of the letter or the spirit of their own language? And as to gymnastics and music, is it not clear he would look upon us, in both these matters, as very barbarians? Fox-hunting and Doncaster-racing might seem to him, perchance, like some small stunted uninspired "progenies vitiosior" of the Olympic Games; but where would music be found? What would he say to those pyrotechnic exhibitions, and public tumblings of sweet sound, called the Italian Opera, to which the gaze of the fashionable world is attracted periodically, and on the faith of which some people have been hasty to assert that the British are a musical nation, and musically cultivated? Truly we have music *in us*; if we would only draw it out in a rational way; but it never can come from Italy or Germany, or any where else; unless, indeed, life can be made to jump out of one man's body into another's; unless the rivers in New South Wales may be permanently reinforced by buckets imported from the St. Lawrence and the Amazons: but Aristotle would tell us, that music to the Greeks was an atmosphere out of which they could not breathe; a living habit stamped on their existence; a religion which hallowed every day to a people, that had the misfortune not to know the Sabbath. So the Stagyrte might be supposed to discourse, and pointing to many passages in his writings, and in Plato's, ask us, why we had been studying these volumes, or pretending to study them, so many centuries, and yet made so little practical use of them. There could be no answer to this question. We should stand convicted of superstition, self-contradicting, like that of the Italian brigand, who sanctifies his murderous deed with a cross; perhaps worse, of hypocrisy; calling the Greeks Lord, Lord, and doing not the things which

they say. Nothing but confession, and penitence, and reformation would beseem us. The Greeks were Greeks, and pure Greeks; living and breathing in the element of healthy Nature, which is always the element of the beautiful; not rich in picture galleries merely, hung up for show by a few lords and great men, but daily standing in the middle, as it were, of a living peristrepic panorama of the fine arts. So also we must be Britons, and pure Britons only in the first place; all our vital functions must rejoice in a free British cultivation, and a free British growth; we must encircle ourselves with an atmosphere of the nobler British instincts, purified from the dross of merchandize, and money-making; for if we do not these things we shall still remain mere formalists; having a name to live, as the Apostle says, while we are dead; and all our Greek, and all our classicality shall be vanity and a lie.

ART. II.—1. *Les Fastes de Versailles.*—By H. Fortoul. 1 vol. 8vo. Delloye, Paris. 1839.

2. *Le Palais de Versailles.* By J. Vatout. 1 vol. 8vo. Didot, Paris. 1837.

3. *Galerics Historiques de Versailles.* By M. Gavard. Folio. Paris. 1837.

WHOEVER wanders through the green alleys of the park and bosquets of Versailles, or paces the endless galleries and ever-succeeding suites of rooms that compose its stately palace; be his object curiosity for the present or inquiry for the past, a feeling of sadness as well as reverence must be excited in his breast as he wakes with solitary step the long silent echoes of this, the once brilliant abode of courtly elegance and regal grandeur. The slightest tincture of historical lore will revivify such ground to a mind of even ordinary sensibility: the trees would utter music, the shrubberies tell their tale, the stones themselves would seem instinct with life and voice to the least poetical imagination, if it could by possibility forget that at Versailles it was treading in the steps of all that was once the brightest and the loveliest of Europe; of all that was great and powerful in those stirring and energetic times when the nations of this quarter of the globe were assuming their present relative stations, and when Versailles was the centre of the politics, the arts, the literature and refinement of the civilized world. True it is that the sterner virtues which hallow the plain of Marathon and the walls of Iona had sel-

dom, if ever, their echo on this spot: the patriot and the religionist, at least in the usual acceptation of these words, rarely appeared among the demi-gods of this French Olympus; the very idea of simple and natural excellence was almost unknown to the gay, magnificent crowds that peopled this now deserted abode. Man existed here in an artificial state; the good he aimed at, while within the circuit of Versailles, was good only in a peculiar and restricted sense; and the deities, if deities he worshipped, were never more exalted in purity than the muses, while they more frequently took the form of Mars or of Mercury, of Bellona or of Venus. The originator, the creator of the whole, by whom and for whom it existed, assumed, as is known, the attributes of the God of Day; and his motto, which still glitters on the walls of the palace, "*Nec pluribus impar*," stamped at once the character of the place and of its inhabitants.

But though the severer development of the human mind and the more pure and beneficent of its operations, found little room for exercise and scanty encouragement to action within the precincts of the court residence of the Bourbons, the full tide of human passions boiled and swelled, ebbed and flowed here with a more than ordinary concentration of fearful violence. Pride and ambition, avarice and selfish cruelty, the thirst of blood and the fever of lust, the mean workings of intrigue as well as the heart-gnawing anxieties of jealousy, hope, fear, revenge and murder; even love,—for love was once no stranger at Versailles,—all have borne their parts in the great dramas enacted here; and none from the sovereign to the page but was a slave to one or more of these imperious masters. State crimes and state virtues, whatever their kind, have all been brought into exercise at Versailles: at one time the lives and fortunes of neighbouring nations hung here by no firmer link than the flimsy thread that determined whether a window accorded or not with the indications of the mason's plummet; at another the gloomy conscience of a royal penitent, anxious perhaps to compound for earlier errors, was worked upon in the confessional to sign the edict that should banish liberty of worship from his realms, and sow in its place the first seeds of future revolution; the unfortunate exiles who had lost a rival throne, were received here with a generosity and a delicacy of feeling that have never since been equalled; and again in later times the virtues of other and still more unfortunate sovereigns, exalted by the melancholy exigencies of the times, here shed the parting ray of their lustre on the halls and groves, soon to be visited

with the long night of political oblivion.—The evil probably prevailed over the good in the springs of action thus assembled and made to exercise their power. We are perhaps warranted in so concluding from the effects which the system of Louis XIV. and his successors ultimately produced; for we can certainly trace back most if not all the faults of the eighteenth century to the foundation of folly and extravagance laid so widely and deeply in the seventeenth. Had not that monarch introduced the system of state mistresses, had he not carried on the war of aggrandizement, had he not levelled all the boundaries of the old laws and customs to pamper to his own will, or his own caprice, France perhaps had not seen the public profligacy of the regency, nor the private libertinism of Louis XV.; the aristocracy would most probably have preserved their fortunes, their territorial influence and the love of the people; while the clergy would have kept their moral hold over the nation, and known how to stem the great social and political cataclysm that afterwards swept and purified, though it ruined and remodelled, the entire framework and appearance of the Gallic community. It cannot be denied that the great French Revolution was the offspring of the system of the Grand Monarque; but it is perhaps idle to speculate in the present day on what might or might not have been the results of courses of action that were never adopted; or to place men on their trial before posterity when posterity itself is possibly not acting a whit more prudently, or with any greater regard to what may hereafter result from its own political systems and constitutions of society.

We would rather turn from the gloomy side of the story of Versailles to look at it in a favourable light, for we do not desire the ungrateful task of criticising what once was great and magnificent, and universally reckoned to be good. Our present purpose is rather to seek out a bright spot of the system identified with Versailles, and to trace the march of what constituted the peculiar glory of Louis XIV., the fine arts of the 17th and 18th centuries, as they existed in France from the accession of the third monarch of the house of Bourbon to the melancholy dethronement of the fifth.

Aware, therefore, of all that may be advanced against the Augustan age of the French nation, and by no means taking up the gauntlet as its apologists, we leave to Voltaire the task of being its special defender and judge; and pass on to inquire into the mutual action which the court system and the cultivation of the fine arts exer-

cised on each other during that period. From the enlightened taste and the really patriotic enthusiasm of Francis I., who was in many respects the greatest monarch that had till then swayed her sceptre, France had made a rapid advance in the fine arts; and was in possession of a school of native artists that bade fair to rival, if not ultimately to excel the longer established masters and more cultivated skill of the Italian states. The immediate successors of the monarch in question, though they did not equally encourage, yet by no means neglected the branch of civilisation that had been favoured by their ancestor. Henry II., for example, was as fond of art and was as kind a patron of artists as his father Francis I., but he was not a man of the same energy of mind or the same activity of body: he was well calculated to fall in with the general inclination, but not to lead the fashion of his age;—and what may be termed his premature death tended by its political consequences greatly to check French art and refinement of every kind. The ambition of Catharine de Medicis, working on the infantine minds of the two next sovereigns; the gloomy religious wars to which the fanatical tyranny of these monarchs subsequently gave rise; and the lamentable period of the reign of the last of the Valois; all these went well nigh to banish art, or at any rate so far disturbed and discouraged those who cultivated it, that the good effects of what Francis I. had done were nearly obliterated. The dreadful massacre in which Peter Ramus lost his life, and Jean Goujon was shot while chiselling a public monument, was the signal for the peaceable lovers of the fine arts to gird up their loins and betake themselves to more favoured regions. They did so:—France with a few exceptions was left to herself, and Henry IV. on his entering Paris, came into a ruined city, no longer the abode of the Muses. The public mind was too much absorbed by the change of dynasty and the turmoil of civil and ecclesiastical discord to attend to the embellishments of life: parties were contending, not in the senate, but in the tented field, for political supremacy;—Catholics and Protestants disputed not so much with books as with swords; Art found no place of quiet abode in a country so distracted within itself; nor was there any hope of fresh progress for it until Henry IV. was firmly settled on the throne.

The last quarter of the 16th century, considering the bright period that had preceded it, and the state of art on the other side of the Alps, was a time of darkness for France. That great architect and man of

science, Philibert Delorme, was a worthy continuator of the school of Jean Goujon, Germain Pilon, and Jean Cousin, but he was about the last original genius of that class of artists; and with him the spirit of what is technically termed in France the school of the *Renaissance* may be said to have become extinct. He was, we have said, the last originator; for though great architects and men of excellent taste sprung up after him, at no very long interval of time, yet when they appeared before the public they came forward as imitators, of classic, or at least of Palladian elegance; they no longer professed to be members of a French school with its own peculiar standard of taste:—and hence, to instance architecture alone, that part of the Tuileries which is contemporary with Henry IV., the Hôtel de Ville, and the Church of St. Eustache at Paris, may be mentioned as probably the latest of the really *original* buildings erected by French architects.

It may be said that the school of the *Renaissance*, itself a branch of the earlier schools of the Middle Ages, was in its decline only keeping pace with the general falling off of the antecedent styles in other countries of Europe. The objection is valid to a certain extent. The Italian schools were daily extending their influence at the termination of the 16th century; but yet it is not to be conceived that the influence of such men as Goujon, Cousin, &c. could so suddenly become extinct had not other and extraneous causes, foreign to art, contributed to effect the change. For instance, the Elizabethan style of architecture and even the remains of the Tudor, the pointed Tudor school, remained longer in force in England than the style of the *Renaissance* in France: not that the English was, properly speaking, at that time an original school, led, as we believe it to have been, in great part by foreign artists; yet had not the troubles of the civil war intervened, symptoms are not wanting to show that a purely English school might have been resuscitated. We cannot therefore but infer that the French school, which was at its brightest period under Francis I. and Henry II., would have continued to produce great original works, had not its progress been checked by the untoward course of events. The architectural wants of northern nations being comparatively greater than those of the south of Europe, there is every probability that the schools of England, Germany, and France, in this branch of the fine arts at least, would have retained the superiority which they gained during the middle ages, and would have developed their principles

of taste to an indefinite extent, had they not all been more or less thwarted and finally cut off in their growth by wars and political troubles.

The death of Henry IV. was in its consequences a great blow to civilisation in France, plunging the country as it did into the intrigues and wars of the early days of his son's reign; but its effects were in part modified by the rise of the great cardinal, and by the international communication which was then becoming daily more and more common between the various populations of Europe. The Italian schools had fully established their pre-eminence;—Rome was then the centre of study, as it has been ever since:—art had become a matter of foreign importation into France;—Pougin and Claude Lorraine were of Italy rather than of Gaul; and in fact every thing was prepared for the flood of Italian taste that Mazarin afterwards let in upon the country.

It is about this period, 1627, when Richelieu was coming into power, and Louis XIII., yielding partly to his melancholy temperament, partly to his fondness for the green solitude of the woods and the diversions of the chase, used to lodge for the night at the miller's in the remote village of Versailles, that our interest in this place commences. That sovereign pitched upon the spot as one entirely buried in the woods, where courtiers were never likely to interfere with him, and as being at an easy ride from the stately abode of Francis I. and Henry IV. at St. Germain; the requisite estates were soon made crown property, and the modest chateau rose which afterwards served as a nucleus for the gigantic constructions of his successors. It is not our purpose to go into the details of the history of Versailles, of the various epochs of its growth and alterations, of its rise or fall; we intend rather to consider it in the different phases of its existence, as indicative of the actual condition and the progress of art at successive periods; we leave therefore to the regular chronicler, and to none more able than M. Vatout, to describe all the changes that successively took place in this great palace, and refer our readers to the large work of M. Gavard, mentioned at the head of this article, for the admirable graphic illustrations that give ocular evidence how the building grew and prospered.

When Louis XIII. constructed his little chateau on the site of his mill, just on the brow of the eminence where a long valley, opening for miles towards the south-west, afforded an enchanting sylvan prospect, it was by no means his intention to make it

any thing more than a hunting seat; and it was in fact one of the smallest of the royal residences. Built of red brick and coped with stone, surrounding a small quadrangle, and itself protected by a fosse, it was the complete type of what a monarch who loved the country might wish as his place of comfortable retirement. It sufficed for his easily satisfied desire of rural elegance, and formed an agreeable contrast to the more rigid and stately magnificence of St. Germain. At this latter place, on the brow of a long table-land, formed by a bending of the ever-winding Seine, stood the royal chateau, the Windsor of France, in which Francis I., after Fontainebleau, so much delighted, and which Henry IV. had so greatly embellished. The part erected by the former of these monarchs, a great pentagonal pile in red brick, half castle and half mansion, stood on the summit of the hill; it still remains there, shorn indeed of its splendour, and vilely desecrated by the bad taste of the present day, which has converted it into a prison; but yet stately and royal in all its outline. The part added by Henry IV. consisted of pavilions and connecting galleries sloping down the side of the hill, and intermingled with gardens that ended only at the river's brink. Of this nothing but two of the smallest pavilions is now to be seen; the giant hand of destruction and the plough of revolution having literally effaced the very traces of its foundations: but it was here that Anne of Austria kept her court, and it was here that Louis XIII. soothed his ennui, as best he might, in the stately circle of his gloomy attendants. He mounted his horse in the morning and galloped over the hills of Marly to the woods of Versailles, to avoid his wife, whom he hated, and Richelieu his minister, whom he feared; Versailles became the abode of his predilections; and as such was remembered with filial affection by his son, who, on determining to erect a palace such as had never before been seen, and in the newest style of Italian taste, preserved intact the interior of the court built by his father, and thus handed down to us a precious relic of the first half of the 17th century.

“As you approach by the Place d'Armes, where the town dies away at the foot of the railings of the Chateau of Versailles, you distinguish the different parts of which this imposing mass of buildings is composed; you see the movement of its lines and the arrangement of its edifices. In the midst of all these wings opening and resting one on the other you discover, in the central part and in the furthest removed of the various planes of building, a *morceau* of a peculiar style of architecture. It is modest and retiring, com-

pared with the adjacent masses of masonry, but it wears a serious air, that attracts attention much more surely than all the blanchéd walls by which it is surrounded: it shines among them like a little diamond of great price enchased in metal of which it was easy to be prodigal. This is all that remains at Versailles of the chateau built by Louis XIII. The architecture of the time of Louis XIII. breathes a perfume of *vieille gentilhommerie*, which hardly survived it. After him royalty imposed its solemn and uniform livery upon every thing; whereas in the monuments in brick of the first half of the 17th century we still see the aristocracy of ancient times shining forth,—an aristocracy of good stamp, and though of noble bearing yet without fastidious external display; slightly countrified, still smacking somewhat of the old country manor houses, which it had hardly given up inhabiting, and yet full of urbanity and elegance, and of a frank and open character.”—*Fortoul*, p. 28.

M. Fortoul has here happily characterized the style of a period little known and still less relished in France, but one which is perfectly appreciated in England. The times, the habits, and the customs of Louis XIII. and his court correspond to those of the end of James I. and of the unfortunate Charles: a period which, whatever may be the political opinion entertained as to its acts and their results, is one peculiarly grateful to all who love chivalrous and noble deeds. At that period the nobility and gentry of France and England, though somewhat lessened in their baronial privileges and in the rather dangerous power they had possessed in the time of the Valois and Tudors, still kept up great state in the country in their ancestral halls amid their numerous retainers. They had not yet learnt to congregate in towns or to flutter in numbers about a court, as afterwards under Louis XIV. and Charles II.;—they still maintained the grand feature of a noble hospitality, and lived for the most part loving and beloved amid their tenants and friends. Though not very learned they were beginning to improve; and they had already shown themselves just appreciators of the arts, both in their residences and in their personal habits of luxury and ornamentalism. Holbein had enriched the galleries of many an English noble, and he was followed by Rubens and Vandyke; while Inigo Jones was beginning to give a decided bias to the national taste, and to add his share—no small one indeed—to the cultivation and diffusion of the fine arts. In France we know how much Jean Goujon and his school had done in Henry II.’s time:—Poussin and Philippe de Champagne had already decorated part of the palace of the Luxembourg for Marie de Medicis, and

had left France for Italy; Claude Lorraine was flourishing; Puget was developing his sculptural genius; and the future designers of the park and palace of Versailles were laying the foundations of their after-fortunes. Vouet was then the leader of the French school of portrait painters; and he had, like Vandyke, grand materials to work upon. At that period the graceful costume of Spain was in full vogue throughout the south and west of Europe,—that costume the best that our ancestors ever wore. The ample folds of the mantle, the sober dignity and even grace of the vest and the broad hat, the elegant display of fine linen, of convenient and well fitting boots, and the easy adaptations of the whole to either magnificence or modest plainness, everything was in favour of the portrait painter of those days. For the fairer portion of creation the elegantly proportioned length and swell of the silk or velvet robe, the gracefully tapering and yet not too much confined waist, the modest and becoming dress of the neck, and the coquetish *espièglerie* that lurked in the delicate little curls of a beauty of the first Charles’s or the thirteenth Louis’s court; all this made the painter’s a task of comparative ease and enjoyment. As a matter of art it was one of the greatest injuries that Louis XIV. caused to Europe to banish, as he ultimately did, this elegant style of dress, and to patronize in its stead the unnatural wig and stiff coat of the men, and the untidy negligée or the buckram armour in which the ladies of Versailles and, in imitation of them, the world, were made to delight. To carry the comparison still further, if we could suppose Vandyke himself set down to portray a beauty of the court of George III. or of Louis XV., it may very well be questioned whether he would produce anything beyond the wretched daubs that used to be called pictures and likenesses about the year 1770. Spain was still a great and powerful nation in the time of Louis XIII.; and from her rough and picturesque country, where the aristocratical ideas of the age, like those of monarchy, found their most stately and solemn type, she sent forth tastes, fashions, and manners that subsisted in the world long after her power had begun to decline. Spain was always original; and it is to be lamented that so much of what she has done for the embellishment and improvement of social life should have been so slightly preserved, so seldom copied in later times, and so little studied. To any one familiar with the solemn canvasses of Velasquez, the real dignity of his figures, aided in no small degree by their dress, will be vividly apparent as compared with the contemporary productions of France.

artists:—and there can be no hesitation in placing him and Vandyke at the head of those who knew how to delineate the noble patrons and the gentle beauties of their times.

Every thing relating to art in the days of Charles I. and the Commonwealth in England, of Philip IV. in Spain, and of Louis XIII. and Richelieu in France, was grand, solemn, and to a certain extent melancholy. Art partook of many of the lights and shadows of the time; in one particular branch, and in some respects the most permanent, architecture, the traces of this state of things have come down to the present day. The part of the palace of Versailles built by Louis XIII. is the most simple in its arrangement, and almost the most gorgeous in its decoration of the whole edifice. It includes the famous Cour de Marbre, and the state bed-room of Louis XIV.; the well-known *Œil de Bœuf*, and the *Petits Appartements* of that king. The internal decorations were made by Louis XIV. it is true, but the general spirit is that of his predecessor; on the other hand, the spirit of the *Siècle d'Or* and of the *Grand Monarque* is shown in the Long Gallery, and in the stately saloons of Peace and War by which it is terminated at either end. A splendid monument of the ecclesiastical architecture of that period is found in the church of the Val de Grace at Paris, built by Anne of Austria in fulfilment of her vow on the birth of Louis XIV.; it is Italian throughout, but is bold and in many respects original, and it is one of the most elegant edifices of that date now remaining in France. Another instance is the church of the Jesuits, dedicated to St. Paul and St. Louis in the Rue St. Antoine, also in Paris. Cardinal Richelieu performed mass in this church at the epoch of its termination, and all the solid grandeur of the time is displayed in its façade as well as in its dome. The capital contains another fine façade of the same date, that of St. Gervais, and another curiously tormented and altered erection in the western part of St. Etienne du Mont. All these are monuments not much attended to by strangers who visit the French metropolis; but we adduce them as some of the few remaining instances of the grand and rather solemn style that characterizes the epoch of the great cardinal and the melancholy king. The corresponding edifice in London that will at once occur to recollection is Inigo Jones's splendid fragment of Whitehall. O, si sic omnia! had all our British palaces been like this!—Louis XIII. was not more governed by his minister Cardinal Richelieu, than his kingdom was tyrannized over by that proud and able ecclesiastic.

His influence over the political condition of the country is foreign to our subject, but his enlightened protection of the fine arts entitles him to rank amongst the greatest statesmen produced by France. The Palais Royal originally constructed by him was at that time the centre of all that was refined, learned, and artistical of the court and capital. The cardinal himself was, if not an artist, at least a warm admirer of all that related to art, a fabricator of dramatic pieces if not an original author: and Richelieu laid the foundation for Mazarin, just as the latter paved the way for Louis XIV.

Cardinal Mazarin may be regarded as one of the most enthusiastic patrons of arts and artists, and one of the most earnest promoters of courtly refinement to be found in the annals of the French nation;—for though an Italian by birth, by circumstances he was altogether a Frenchman. The splendid collection of fiction which he formed, and the library he left to the College des Quatre Nations, now the Institute, are too well known to need more than an allusion; but he who would learn the private state of this ecclesiastical minister should traverse the long galleries of the Bibliothèque du Roy at Paris, and examine the arrangement of the suites, the ornamentation of the walls and the decorations of the ceilings. They form one of the richest series of examples of domestic splendour that we are acquainted with; and the paintings, principally, we believe, by the hand of Lebrun, are well worthy of study. Another Parisian instance of the taste of this epoch is to be found in the ancient hotel of a president of the parliament, the most eastern mansion on the Isle St. Louis, built by M. Lambert in the time of the cardinal, and decorated throughout by Lebrun and Lesueur:—the paintings of the Great Gallery are here as fresh as on the first day of their exhibition, and all bear testimony to the grand and solemn taste that characterized the day.

The mention of Lebrun, leads us naturally to Louis XIV., and to consider the state of the fine arts in his half century of glory. The causes that led this monarch to raise the immense structure of Versailles are very uncertain: the idle story that he wished to fly from St. Germain, because he could not bear the sight of St. Denis, where he knew he should be one day buried, is more than improbable, especially since he continued to hold his court in the old palace of Francis I. for twenty-one years from the date of the first works begun at Versailles. M. Fortoul says that the monarch was led to the scheme as much from love for Mlle. de la Vallière as from any other cause; but he does not

make out a very clear case in proof of his assertion:—the grand fêtes that took place on the opening of the new chateau were no doubt given in her honour: so also was the grand carousel in front of the Tuileries: but Louis would have built quicker had love been his real stimulant. We are inclined to attribute it partly to his desire of rivalling other monarchs, partly to that of placing his own magnificence out of all danger of eclipse by that of any of the great lords of the land; and partly to his warm perceptions of, and relish for all that promoted art. The Spanish monarch had already been installed at the Escorial, the Popes had long dwelt in the Vatican; and for the French court to be lodged more splendidly than either of these, the courts then imitated as the most polished throughout Christendom, it was necessary to have a residence of greater size and more modern luxury than the half-feudal, half-palatial chateau of St. Germain. To effect this, Louis XIV. offended deeply what now would be called all rules of good taste in pitching the royal residence amidst woods, well suited indeed to the hunting tastes of Louis XIII., instead of fixing it on that ample *plateau*, the terrace of St. Germain, which overlooks the plain of St. Denis, and almost that of the capital. If the inspirations of Mlle. de la Vallière went for any thing, they may have been influential here in making the monarch sigh for a quiet valley and soft bosquets: but the truth is, that the taste for the picturesque hardly then existed,—or, if any where, only in Italy and Flanders. Louis, troubled with few ideas of the kind, laid out in his own mind plans which, had they been realized, would have made the valley of Versailles one of the sweetest spots in France. As an example, it may be mentioned that the king's original intention was to turn the river Eure out of its course and to bring it into the Seine at Serres, instead of leaving it to flow through Lower Normandy. St Germain too, it should be remembered, was not equal to the royal chateau of Blois, or to that of Chambord, and hardly to Fontainebleau; nor was it so much superior to the chateaux of several of the nobility as appeared necessary to a young king, who remembered the insolence of the Fronde. Jealousy, therefore, of some of his courtiers acted probably as a stimulus to the alterations and enlargements of Versailles. An old story that throws some light on this subject is so well told by M. Fortoul, that we hope to be excused for repeating it in his words:—

“Mazarin had scarcely been dead four months, when the intendant Fouquet invited the king and the court to an entertainment

which he had prepared at his chateau of Vaux. This chateau, recently built in the neighbourhood of Melun, had acquired such a reputation for richness and elegance that it was confidently said St. Germain and Fontainebleau could not be compared with it:—it had cost eighteen millions of livres: the gardens were the first essay of a young man named Le Nôtre, who promised to excel in this style even the Italians, by whom, however, the art was supposed to have been carried to perfection; nothing had ever been seen so majestic and so grandly distributed. As for the chateau, marbles, balustrades, and columns had been lavished upon it:—it was a prodigy of luxury and novelty. An artist, a young man also, who had recently arrived from Rome, and was named Charles Lebrun, had adorned the interior; it was said that the pictures which he had painted there would cause a revolution in art, and would at length create a real school of painting which France would be able to oppose to the glorious schools of foreign nations. On the afternoon of the 17th August, 1661, the court came to visit the chateau. The king, the queen-mother, monsieur, madame, and a number of princes and seigneurs were assembled there; but the queen was unable to come on account of her pregnancy. The court began by visiting the gardens, and examined with evident pleasure the water-works and basins, to which forms of great beauty and variety had been given. The king appeared to share the general satisfaction expressed on this occasion: he was observed, however, to stop before the coat of arms of Fouquet, which met the eye on every side, and which was charged with a squirrel, and the motto *Quo non ascendam?* It has been said that Colbert, who was present at this fête, then first informed Louis XIV. that Fouquet had offered 200,000 livres to Mlle. de la Vallière as the price of her virtue. The king was at that time enamoured of this young lady: he, however, concealed his anger, which this intelligence had worked up to the highest pitch, and partook with good grace of the supper served up after the promenade, and the honours of which were performed with infinite tact by Madame Fouquet. After supper he went with a perfectly composed countenance to the play that had been prepared, and for which a theatre had been erected at the bottom of the great alley of fir trees. Torelli had made all the machinery, &c. of the piece, and Lebrun himself had condescended to paint the scenes. Molière gave the first representation of his comedy *Les Facheux*; and Pélisson, who was employed in one of Fouquet's offices, had composed the prologue. The comedy was exceedingly successful. Menage declared that it was one of the best that Molière could write, the verses were perfect, the characters happily and vigorously traced. The king was quite charmed at it; he desired to express his satisfaction to Molière, and while he was complimenting him, M. de Soyecourt, the greatest sportsman in France, happening to go by, the

king added,—“There’s an original whom you have not yet copied !” Molière took from this hint the subject of the new scene of the *Chasseur*, which he was determined on adding to his comedy, and soon after set to work upon it. After the representation was terminated, the court went to see the fireworks, which were much admired. While the petards were battling with the waters, and the rockets were marking a thousand glittering paths through the air, La Fontaine, placed in a corner, was considering the pleasure he should have in writing the details of these fêtes to his friend, De Maucroix, at Rome; he was already collecting the rhymes for his narrative, and thinking of his beloved patron, Fouquet, who would enjoy “*une fortune à laisser la renommée.*” On a sudden the noise of the royal trumpets succeeded to that of the fireworks, for the king, desirous of returning the same night to Fontainebleau, had ordered the mousquetaires to be in attendance. Louis XIV. all this time let no indication escape him that could dissipate the enchantment of the innocent hearted poet, and before leaving he desired Fouquet himself to accompany the court on its intended excursion into Brittany. The Intendant went thither; but he was arrested at Nantes a few days after, and transferred successively to Angiers, Vincennes, and at length to the Bastille. His trial was held before the parliament, in a chamber composed of the relations and friends of Colbert. The examination lasted three years; and at the end of this time Fouquet was condemned to banishment. Louis XIV. was not to be turned from his purpose either by the intreaties of Mlle. de la Vallière, or the verses of La Fontaine. He even once said, ‘if his death is decreed by the parliament, I shall allow it to take place.’ He thought the members of the parliament had but badly ministered to his anger; he increased the punishment, and changed the decree of banishment into that of rigorous and eternal imprisonment. Before he was led to it the unfortunate Fouquet learnt that the king had just given orders to make Versailles surpass, not only the chateau of Vaux, but all the palaces in the world; that Le Nôtre had been entrusted with the laying out of the gardens, and Lebrun with the decoration of the apartments; that fêtes which had never been paralleled had already been given in the palace, for which Molière had also written comedies; and that in fine, Louis XIV. had concentrated round his person all the éclat of luxury, of art, and of genius, which the unfortunate Intendant had had the culpable idea of sharing with the monarch.”*—*Fortoul*, p. 51, &c.

This fête and the episode attached to it, form a fitting introduction to a series of similar entertainments, of which Versailles was afterwards the scene, and of arbitrary acts of power equally inexcusable and equally calling for the hand of retributive justice. We need not do more than allude to these festivities, for they are so mixed up with the personal history of the monarch, and of the great characters of the day, political and literary, that they are fairly parts of history, and are besides, in the recollection of every reader. It rather concerns us to remark that from this period the age of Louis XIV., properly so termed, commenced, and that the arts of every kind now began to take that universal hold on the nation which they have never afterwards lost, with the exception of the melancholy period of the Revolution. The school of Louis XIV. was now definitively established; it soon rose to such preeminence in the opinions of the north and west of Europe, that France became the centre of taste and of civilized arts: and a bright galaxy of great names it was that then appeared in this western clime. To specify only a few out of many eminent men; Lebrun, Jouvenet, Nicolas and Pierre Mignard, Noel and Antoine Coypel, Bon and Louis Boullogne, Vander Meulen, Rigaud, and Watteau, of the painters;—Coysevox, Puget, and the two Coustons, of the sculptors:—Puget again, Francis and Jules-Hardoin Mansart, and Gabriel, of the architects; Lenôtre, the creator of landscapes, and Keller, the great founder in bronze;—all these names shed their full lustre on the period in which they lived, and on the monarch by whom they were protected. To go into a detailed criticism of their works would be superfluous: all that we contend for is that they formed part of one and the same great school, that they participated in a sort of community of principles, and that they may be very well judged and appreciated in a body. They drew their inspirations from one and the same source; they had all the same principal patrons; their models were all taken from the same court; and their works were all submitted to the same fashionable crowd, or the same junta of connoisseurs. Hence little variety is to be found for the painters in their style of face, of position, of dress in their portraits; Pierre Mignard being perhaps the one who showed the greatest indications of originality, notwithstanding the bland style and soft accommodations of his palette. In their historical compositions they differed more widely according to the liberty given to them by their subjects, the palm being closely disputed between Jouvenet and Lebrun. Of the sculp-

* We have only to add to the above, that although doubt has of late been thrown on the very existence of such a person as the famous iron-mask of the island of St. Marguerite, yet common tradition is nearly unanimous in believing that he was the ill-fated Fouquet. We doubt whether Fouquet’s sentence was reckoned any thing more than an excusable *coup d’état* in those days.

tors, no doubt can be entertained in assigning the first place to Puget, and after him to Coysevox;—of the architects, Jules-Hardoin Mansart, the builder of Versailles, Marly, Trianon, Clayny, and the Invalides, is by far the greatest: but he was ably seconded by his illustrious contemporaries, and was rivalled in the degree, not the kind, of his peculiar merit by Lenôtre, to whose genius for accommodating the works of nature to those of art he was more indebted than he was probably aware.

One of the principal characteristics of the whole school of fine arts in the time of Louis XIV. was the grandeur and magnificence of general design softened by the ideas of luxury and elegance that were becoming habitual to the nation. Thus in all the elaborate compositions of Lebrun that adorn the ceilings of Versailles, though every thing is majestic and royal, there is little either sombre or melancholy. The reigning monarch was of an infinitely more joyous temperament than his predecessor, and setting himself up like Apollo to give light and life to the whole universe, he affected the brilliant and dazzling rather than the terrific or gloomy. Hence the general character imparted to the whole school:—and as two of the best examples of it, the ceilings of the *Salon de la Paix* and the *Salon de la Guerre* at Versailles may be cited. The series of sacred pictures that surround the interior of the choir of Notre Dame at Paris, all of them masterly productions, are also good types of this school as contra-distinguished to all those of Italy. How different too from the Poussins, the Philippe de Champagnes, the Claude Lorraines, the Vouets, and the Valentins of a former day, imbued as they were with Italian ideas, and hardly to be reckoned among the painters of France. In sculpture the style was greatly changed from that of Jean Goujon, Jean Cousin, and their contemporaries; and it had suffered by the alteration: the *Milo* was the principal work of Puget, but it is doubtful whether it ought to be preferred to the *Diane de Poitiers* of Goujon. The admirable busts of Coysevox are in no small degree the basis of his fame, but they are not evidences of any improvement on the preceding school either in taste or execution. Still they were grand and correct as the sculptors of this age; and they did not fall further below their predecessors than the painters below those of the half century preceding them. In these two branches, however, of the fine arts, it cannot be denied that France under Louis XIV. had not equalled either her own painters, the Poussins, &c. of the period just

alluded to, or her sculptors of a still earlier epoch.

In architecture the styles had become so different from those of the 16th and the earlier part of the 17th century that it is difficult to institute a comparison. The Mansarts, however, uncle and nephew, certainly did effect a great change in French taste, and in fact fixed it for upwards of a century: they carried the Palladian principles to a high degree of refinement, and they superadded an abundance of minor ornaments which the severer and perhaps purer taste of the Italians would have led them to reject. If we take the chapel of the Invalides at Paris, or the chapel of the palace at Versailles, we shall find all the system of sculptured garlands, of fruits and flowers, of panels with richly ornamented mouldings, of the breaking up of spaces by the introduction of niches and figures, brought into full demonstration. The contrast of the excessive ornamentation of each of these sacred edifices with the plainness of many parts of the main buildings to which they belong, cannot but strike the most indifferent eye: but the cause is, that what the architect effected in one case the painter and the ornamental decorator was left to do in the other: and again it was perhaps a religious feeling, that the house of God should be more magnificent than the house of man, that led them to establish the distinction.

As a whole, the façades of Versailles towards the garden are the grand constructions on which the fame of their architect mainly depends: nor indeed can any thing be devised of more courtly elegance or more stately beauty than the endless series of windows and columns and statues of which the whole erection is composed. The building was admirably suited to the purposes and the taste of the monarch, whose intention was to make his court not only the most magnificent, but also the most elegant of Europe. Louis XIV. is entitled to the name of "the Great," for this the main idea of his life: he wished to be first in all that appertained to monarchy; in power, in civilisation, in literature, in art: and on the whole he succeeded: he was the great king of the epoch. Versailles was all that such a sovereign could wish: the palace in its extent could lodge the largest court that had ever been collected round a throne, and the extent of which may be judged from the fact that the *Grand Commun* accommodated 2000 servants every night:—in its internal arrangement and decorations it was all that the most sumptuous taste limited by no fears of ex-

pense could make it;*—and in its position it was a striking example of the victory gained over almost insuperable difficulties by labour and skill.

The framing a new system of court etiquette came therefore as a natural consequence when the court entered into possession of this splendid abode : and it was the completion of the monarch's scheme. In forming to ourselves a picture of what Versailles was in the bright and palmy days of its full glory, if we would rightly appreciate it we should take into account the ideas of the time : for this immense monument was in fact

“the expression of the monarchy such as Louis XIV. had conceived it; it was the faithful *resumé* of the work of the great king. We wonder sometimes that his reign, so fertile in men of great genius, never produced an epic poem :—but in fact poetry in these days adopted any form except this ; and the epopeia of the 17th century was Versailles itself. . . . During the two centuries that the French was an absolute monarchy nothing was done that had not either its cause or its effect at Versailles. All the policy of the time was debated on within its walls ; every cannon-shot fired in Flanders, in Germany, or in Spain awoke here an echo. . . . The history of Versailles is the history of civilisation during the two last centuries ; the chateau itself is one of those culminating points from which the sight of the mental eye loses itself in boundless prospects ; and as from the summit of the Alps we perceive the forests that clothe the shoulders of these mountains, the streams that issue from their sides, the towns embosomed in their shade, the empires divided from each other ; so from Versailles we discover the movement of the manners, the wars, the diplomacy, the literature, the arts and the powers that have agitated Europe for two hundred years. To place oneself on the balcony of Versailles is to view the whole world from the throne of Louis XIV.”—*Fortoul*, p. 7.

The ideas here suggested are ably followed up in the book we have just quoted. M. Fortoul has succeeded in laying before his readers a very pleasing and original outline of the whole of the reign of Louis XIV., Louis XV., and Louis XVI., as connected with the palace of Versailles and the scenes occurring within it. He puts the artistical point of view in the chief place of his plan, and round it he collects a vast

number of anecdotes and reflections that will repay the trouble of perusal.

M. Vatout, whose work we have mentioned at the head of this article, in leading his reader through the palace, as it is at the present moment, recalls to mind at each step that he takes the principal events connected with each hole and corner of the historic rooms through which he conducts us. He performs in good truth the office of a guide, but in a very agreeable manner ; and he supplies us with a considerable collection of anecdotes and circumstances either unknown or little remembered, which all throw additional light and interest on the times to which they refer.

With these two works, added to M. Gavard's wonderfully accurate representations of all the architectural details and all the decorative riches of the palace, the fire-side traveller, or the historical student, who never stirs beyond his library's threshold, may have a very fair idea of this central pivot of the ancient monarchy of France. The illustrations of the gardens, one of the most interesting parts of this royal residence, and of the *satellites*, as they are termed, or the small palaces that surrounded Versailles—the two Trianons, that is to say, with Marly, Meudon, St. Cloud, Sceaux, &c., are to be found in M. Fortoul's work, with an interesting notice to each.*

Versailles, as finished by Louis XIV., should not only be regarded by the historical examiner with his mind full of the events of the times in which it was constructed, and with the spirit of the great court and king, whether good or bad, before him ; but it should also be looked on as a portion of a system of royal display which is worthy of notice in all its parts ; especially when the question of art is concerned. Thus the immense park and gardens that surround it, in themselves the best and grandest examples of the magnificent ideas of the times, must never be omitted either by the reader or the visitor of this palace :—nor must the *ensemble* of Versailles, park, gardens, and all included, be contemplated without connecting it with the other palaces and domains of the crown. In truth, though the modern style of landscape gardening is by no means in accordance with the taste that prevailed in the time of Louis XIV., there

* M. Vatout after having examined all the documents public and private that were of any authority on the subject gives up the task of fixing the sum which Versailles cost Louis XIV. :—it varies according to different calculators from 16 to 120 millions sterling.

* Great praise is due to the pictorial illustrations of this book, and to the spirited publisher, M. Delloye, who produced it in Paris simultaneously with the Annual that bears the same illustrations in London. These plates give an accurate, and at the same time (what is very rarely effected) a picturesque idea of the Palace, its dependencies, and the surrounding scenery.

is much to admire in the system adopted by Lenôtre and other horticulturists of his age,—in the stateliness and solemn grandeur of his masses of wood, his bosquets, and his groves, the principal lines and the lights and shadows of which accorded so well with the architectural magnificence and stiff forms of society in the days when he lived.*

We should bear this in mind when we examine the rural system of Lenôtre as displayed at Versailles, at Marly, at Meudon, and at the Tuileries, and in many a noble chateau throughout France; and we are quite sure that he is entitled to the praise of being the greatest master in his art. To one standing on the great terrace in front of Versailles and looking down the long valley to the west, one of the finest specimens of cultivated nature that is any where to be found is developed: there is nothing mean, nothing little, to be perceived

* In England we have certainly gone into the opposite extreme in our ideas of horticultural elegance: it is all very well to surround the *cottage ornée* with the green lawns and undulating groves and glades that form the only kind of landscape gardening now tolerated; but to think that a stately feudal castle or a Palladian villa must necessarily look well in any kind of artificial rustic scenery that we may choose to form round it, is inconsistent. All styles and orders of architecture were formed with certain intentions, grew up in accordance with certain customs and ideas, made part of the national mind of the people that originally used them; and there is always something that shocks the eye when they are found incongruously or inconsistently applied. For a feudal castle to be surrounded with "tall ancestral groves," with deep fosses bathing the walls, or with broad and ample terraces, all this is very well; but to see the same edifice placed in the midst of a nicely shorn lawn, with beds of roses and geraniums fantastically interspersed; without any outward character of stern defence, without any thing that can remind us of the approaches of a baronial tenement in former days—all this is absurd, and destroys the illusion that the mind would gladly form to itself. We are not sure that the comparison might not be carried still farther, and that particular styles of residences should not only be accompanied by their own appropriate styles of rural cultivation, but even limited in accordance with the style and class of persons who are to dwell in them. Thus it may be very well for a nobleman of extensive territorial possessions and long lines of proud ancestry to inhabit a cottage or a forest lodge at the seasons when taste or rural pursuits are supposed to lead him thither, because it may be taken for granted that he possesses houses as various in their nature as his estates are in their position and natural qualities; but for the tallow-chandler who has realized his few thousands to go and build his "Gothic castle" at Richmond, at Highgate, &c. is grossly absurd, because by no force of the imagination can any ideas of antiquity or feudal power be attached to the line of the Stubbsses or the Stileses, &c. There is ample room for the formation of a strict code of etiquette, or rather of good sense, in matters of this kind.

in any direction; nothing that can offend the eye or convey a disagreeable impression to the senses. A rich expanse of groves and woodlands, an undulating succession of well cultivated hills, and a series of magnificent terraces sinking one beneath the other immediately under the feet of the observer,—every thing has a beautiful, elegant, and royal air of richness and luxury. One of the great charms of Versailles, and indeed of most of the royal and noble residences of France (as they were originally formed) is, that every thing is in keeping, and consistent with all around it: it is all real;—no sham, no make-believe; royal, or noble, or ecclesiastical, just as the case may be; and the eye and the mind are alike satisfied. We speak of things as they were in France; not of things as they are.*

In all the subordinate chateaux of the French court, when they were in their full glory, at the time of Madame de Maintenon's coming into favour, the system of Versailles was repeated on a smaller but almost equally brilliant scale. Marly, indeed, though a satellite in some respects, eclipsed the central planet itself; that is to say, in elegance and the minor *agrémens* of court society. Upon all these residences we would recommend our readers to consult M. Fortoul for a spirited sketch of their condition; and should they visit Versailles they will find two or three rooms of the Cour de Marbre (once indeed the ball-rooms of the unfortunate Marie Antoinette) filled with highly interesting contemporaneous views of the various royal residences, just as they were about the time above indicated. These pictures are occupied in nearly all their foregrounds with groups of the principal personages of the court; the likenesses being highly finished in most cases, and the whole forming a highly instructive series of illustrations of all that has been written on the age of Louis XIV.

At the time of this great monarch's death Versailles was the complete expression of

* It should not be forgotten that the influence of the Court of Louis XIV. was felt as much in England as in any other part of Europe, introduced as it was by Charles II. and maintained even after the Revolution of 1688, notwithstanding the hostilities of the two countries. This part of the history of England, the social influence of our Gallic neighbours on ourselves, is too well known, as to its general fact, to need more than a cursory allusion: but to the lover of domestic history, and to those who amuse themselves by tracing the whims and fancies of mankind in their fitful course of wandering from the inventive nation through all the imitative populations, there is an ample field of inquiry with regard to what we may call the Gallo-mania of England at the end of the 17th century.

the social tastes, and the social ideas of France: and to form a really accurate idea of what that age did, and thought, and wished for in matters of art, we must always recall to our imaginations Versailles in its primitive glory. When the aged king was dead, the spirit of the monarchy received a mortal wound; absolute power had under him attained its highest pitch, consistent with the high degree of civilisation that prevailed at the time: after him the political influence of the monarch declined no less rapidly than his moral *prestige* over a nation that had become not less dissipated in its upper classes than miserable and degraded in its lower. Art did not so soon decline:—the first attribute it lost was grandeur, and the first symptom of this was shown by the taste of the regent in quitting Versailles for the Tuileries. Court etiquette relaxed; courtiers had become more demoralized than they had ever been; plebeian tastes began to infect the nobility; and Paris, under the influence of the regent and the infamous Cardinal Dubois, was a sink of infamy. Versailles never improved after this period; its true soul had fled with that of the monarch who had erected it: no one else was capable of inhabiting it as it deserved; and as a sign of this the state bed-chamber of the *grand monarque* was never afterwards inhabited. Louis XV., giving himself up to an unrestrained life of debauch, and preyed upon by hundreds of intriguers of each sex, destroyed many of the internal arrangements of the great edifice to suit the exigencies of his mistresses. M. Fortoul well observes that Madame de Maintenon's wish at Versailles was the chapel; that of Madame de Pompadour the *Salle de l'opera*: the comparative excellence of these two buildings is an exact measure of the relative tastes and ideas of the times.

The latter is very sumptuous no doubt, and when it was first erected was a marvel throughout the world; but it does not stand the test of time like its neighbour the sacred edifice; this latter is as magnificent now, compared with other chapels, as it was then; the former is surpassed by twenty other theatres in Europe.

The general school of art declined in the same way as the court:—elegance was preserved, and even voluptuousness of idea introduced, but grandeur and originality were gone. Bouchardon, the younger Coysevox, and Vanloo, did not sustain the reputation of Mignard, Lebrun, and Jouvenet:—Gabriel the younger erected nothing that could be compared with Mansart's works:—the younger Coustons had degenerated from the elder, and from the traditions of

Puget or of Coysevox:—Lenôtre had no one to replace him. Whoever has studied the whole of the subdivisions of the French school must be aware of what is here advanced. There cannot be a more convincing proof of it than the general fact that Louis XV. attempted nothing grander than the erection of Choisy and the Petit Trianon,—not to speak of his harem at the Parc aux Cerfs:—he added the theatre to Versailles, but he destroyed one of the grand staircases, and he spoilt many of the best apartments: instead of founding any new and great institutions in favour of art, he tamely and coldly patronized what already existed, and art, as might have been foreseen, inevitably declined. It was at this time that the ponderous decorations of the interior of noble mansions were no longer formed of solid marble, crystal, and stone, but gilded wood; with an universal and undue charging of all objects with ornament, breaking up the grand lines that give force and dignity to architectural compositions, and frittering away labour and expense upon parts that would have remained far better had they been simple. No farther improvements were made in landscape gardening: Lenôtre was implicitly followed; and this to a certain extent was fortunate, for it kept things from deteriorating so soon as they would otherwise have done:—but the genius of natural and artificial gardening was extinct: nothing except imitation remained. Dress, which first of all began to affect simplicity, at last became ungraceful, inconvenient, and unnatural:—witness the common habit of the end of Louis XV th's time, as compared with the beginning of the same century;—the curling wig, which might or might not be *possible*, changed for the absurd cauliflower or the pigtail; the *négligé* of the ladies, which at least had some plausible excuse on its side, driven out by the monstrous hoop; and the long locks of hair, its natural colour altered for the stiff toupée and the disgusting use of powder. All had declined; all was getting disorganized; all was going wrong: there was a malady at work in society itself which affected all the outward demonstrations of human intellect: the state itself was hastening to decomposition; and art, the constant index of civilisation, was degenerating with scarcely less rapidity.

The melancholy period of Louis XVI., although the personal virtues of the monarch and his queen for a time seemed to check the evil, saw the woes and ills of society galloping on to their final goal. Under them little was done at Versailles, little at the other palaces:—one name alone of any

really great eminence appears among the painters, Vernet:—one only, Soufflet, among the architects. The sole act of any notoriety ordered by Louis XVI. at Versailles, was to cut down all the trees in the gardens and to replant them:—a melancholy type of what was coming upon the palace, upon the kingdom, and upon himself! Marie Antoinette, on the other hand, laid out the beautiful gardens of Petit Trianon,—but this was not in the style of France; England, Switzerland furnished the models; French art was dead. All, however, that the martyr-sovereigns did is hallowed by their death; and to the visitor of sensibility the little relics they have left behind them in the great palace, like the scenes that under them made so many parts of that edifice remarkable, form some of the most attractive causes of interest that occur to his notice.

But here our inquiry stops; the infuriated mob from Paris are in the Cour de Marbre, the dead bodies of the guards are on the staircase; madness and treachery are without the palace, fear and indecision within:—the court sets out for the capital, and the palace becomes the monument of the dead.

ART. III.—*Mikhail Vasilivitch Lomonosov*,
Sotchinenie Ksenophonta Polevago. (M.
V. Lomonosov. By X. Polevoi.) 2 vols.
8vo. Moskva, 1836.

THE name of Lomonosov identifies itself with Russian literature, as that of its great legislator and *Musagetes*, and in some measure the very founder of its language. His history, before us, if history it be, is, however, singularly written. Although this book does not contain a line of preface indicating the author's object or plan,—he having reserved such explanation for the final page of his second volume,—the first lines of his first chapter evince that far from a regular biography, Xenophon Polevoi (who must not be confounded with Nikolai Polevoi, author of the History of the Russian nation) has adopted for his composition the more attractive form of romance; for we found ourselves *in medias res*, among a train of carts laden with fish, pursuing their route to Moscow in the intensely severe winter of 1728. After this there could be no doubt as to what was to follow; for Lomonosov being of no family at all, there were no pedigree, family records, or documents, to be searched into. Yet if facts were wanting in the life of this eminent man, we cannot altogether

approve of the way in which their place, as it seems to us, is supplied; namely, by assuming the form of a novel.

Unless in those comparatively few instances where great talents have been united with singular misconduct, if not open profligacy, the life of a literary man or artist presents notoriously the fewest points for a novelist. Almost as well might a romance writer search for a hero behind a counter, or in a counting-house, as in the study or the studio. The Germans, it is true, have attempted to bring into vogue what they call *Kunst-romane*, a species of fiction in which a slight outline of story—hardly can it be said, of plot,—is made the vehicle of discussions and opinions on matters appertaining to literature and art, and generally put into the mouths of real personages. Without stopping to inquire how far license of imagination is allowable, or whether it does not partake quite as much of falsehood as of legitimate fiction, we may without fear of contradiction assert that such productions would be absolutely caviare to English novel-readers. Even Schoppenhauer's "*Johann Von Eyck und seiner Nachfolger*," though a work of a more strictly biographical nature, and replete with information relative to the chief masters of the early German school of painting, seems very little, if at all, known in this country; therefore we need not be surprised if Hagen's *Nürnbergische Novellen*, wherein figure Albert Dürer, Peter Visscher, Adam Krafft, and other distinguished worthies of art, have not yet risen upon our own literary horizon. In regard to Heinse we have little reason to regret that his *Kunst-romane* has excited no attention in this country, because, with much eloquent enthusiasm on topics of art, it is also debased by unblushing profligacy, both in the maxims it inculcates and the scenes it describes. Its object seems, not to purify and spiritualize our feelings through the influence of art, but to apotheotize sensuality, and cloak the deformity of vice by representing its enjoyments as indicating an exquisitely organized perception of sensuous beauty. His doctrine, in short, proceeds to the length that this perceptive power, or *Kunstsinn*—for which our language perhaps offers no corresponding term—excuses or rather vindicates all immorality, by tracing it to the principle from which emanates refined art.

We now return to the production that has led to the above remarks. The reader is already apprised how the narrative opens, after the most approved romance fashion, and with an incident admirably calculated to excite strong interest in favour of the

poor penniless lad, whose ardent thirst for knowledge and instruction has driven him an outcast from his home, though cheered with the brightest anticipations,—with dreams of felicity from which he is shortly to be wakened to stern and even bitter realities. It is not improbable that this seductively striking situation determined the author to depart from the regular course of biographic narrative, and adopt that as the starting-point: the idea once fixed upon, it would follow almost as matter of course, that some latitude of invention should be allowed, and fictitious details interwoven with historical facts. In the present instance too much has been sacrificed to the temporary effect thus produced. It is undoubtedly advantageous to produce favourable first impressions; yet first impressions may sometimes be too favourable, inasmuch as they may lead to very disadvantageous after-comparisons when the expectations held out are not subsequently fulfilled. Such is the case here: though sufficiently attractive in itself, the scene alluded to is injudicious as regards the general plan and character of the work; not only because it contains more of stirring adventure than any thing else in the volumes, but also because it is more extended and carefully worked up than those more stubborn materials which required great art first to shape and mould. The gush of the romantic, which promises a good deal, is suddenly dried up and exhausted. We shall not give any extracts from this apocryphal chapter—apocryphal, as regards its action and persons; for the fact itself, apart from those embellishments, is tolerably familiar to English readers.

Passing by therefore the hero's first patron, Pimen Nikititch, the travelling fish-merchant, who after much demurring consents to let Lomonosov accompany him on the road, and afterwards introduces him to a monk, Father Porphyrius, we may state that Mikhail Vassilivitch reaches Moscow without mishap, but only to awaken to a sense of his solitary and unfriended situation, the reverse of the illusions his fancy had created. The fine opportunity for description which here presented itself is however totally thrown away by the author; a picture of the ancient metropolis of Russia as it then existed, and of the impressions it was calculated to produce on such a mind as Lomonosov's, would have lured any one to dwell upon its more prominent features: instead of this we are merely told that the various edifices and other objects which now first presented themselves to the eye of the stranger lad, suddenly transported from the bleak wilds of Cholmogora, filled him with awe and be-

wilderment. In fact graphic delineation of any kind does not appear to be Polevoi's forte, for on no one occasion has he even attempted it; this is the more to be regretted because, instead of being redundant, such description would have greatly aided the historical colouring of the work, and imparted a charm in which it is now altogether deficient. Local portraiture is to narrative what scenery is to the drama.

Through the means of Father Porphyrius, Lomonosov is admitted into the Zaikonospasskoi school, which he finds the very reverse of what his imagination had pictured as a seminary of learning; there he is not only subjected to many mortifications from his companions, but discouraged also by his instructors. He bears up, however, against the united checks to his zeal, and distinguishes himself at a public examination before Theophanes the celebrated Archbishop of Novgorod, (the Russian Chrysostom,) whose eloquence and talents recommended him to Peter the Great, and who had so large a share in the counsels of that monarch and his successors. After the examination, the prelate retires into another apartment where, while partaking of a collation with the archimandrite and other principals of the college, he sends for Lomonosov, commends his diligence, puts some questions to him concerning his studies, and assures him of his protection. Thus encouraged, the youth ventures to express his dissatisfaction at the dilatory and tedious school-routine to which he is subjected, and complains that he is merely learning words while thirsting for knowledge, in the branches of mathematics and physics more especially. Lest his sincerity should betray him into indiscretion the Archbishop dismisses him, and changes the conversation, nor mentions again until his departure his new protégé, whom he then recommends to the archimandrite and prefect. Flattering as is the notice of so high and eminent a personage, Lomonosov finds the consequences far from agreeable. He now in fact receives his first practical lesson, not in natural philosophy but in the philosophy of life, and discovers that a great man's favour is sure to provoke the ill will of other claimants.

Mortified at having been obliged to listen patiently to the unpalatable truths which Lomonosov unguardedly uttered as to the defective system of education, the superiors at the institution, instead of making the most of the éclat with which their pupil has distinguished himself, resolve to mortify him in turn, and make him feel that, though very secondary personages to the Archbishop of Novgorod, they are still his own superiors.

They exercise their authority, therefore, in such a manner as to render his situation more irksome and disagreeable; and Lomonosov at length determines on going to the archimandrite, who alone seems well-disposed to him, and solicit permission to remove, if only for a year, to the university of Kiev, in order to apply diligently to philosophy and mathematics and attend the professors in those classes. Objections and difficulties are surmounted, and in the company and charge of a Father Antonii he sets out for Kiev for one year, filled with delightful anticipations of enjoyment amidst the literary stores of the university library, which the Archbishop had told him equalled the finest collections he had visited in Italy. Indeed he had little else than the pictures of imagination to occupy him on the road; for we are told that the Pater could not satisfy any inquiries relative to the various monuments of antiquity existing in the venerable city of Kiev. We regret, therefore, that the author did not provide him with a more intelligent companion; or else gratify our curiosity by taking upon himself the office of cicerone, and describing what it seems the Pater could not.

Arrived at Kiev, Lomonosov soon discovers that its university was not then at least the seat of philosophy and the muses. With few exceptions, the students themselves are described as a set of idle, riotous, unruly and ill-disciplined youths, for everything corresponds to the picture which Naræzhny has drawn in his novel of "The Bursak." Disappointed at finding he can gain no instruction in the sciences to which his taste more particularly inclined, and completely disgusted by a public disputation supported by the most puerile arguments, Lomonosov returns to Moscow before the expiration of the allotted term.

About a twelvemonth afterwards, that is, at the beginning of the year 1735, an order comes from the Academy of Sciences at St. Petersburg, enjoining a certain number of the most promising young men to be sent to the northern capital for the purpose of receiving a more complete course of instruction. Lomonosov is included, but not without the interposition of the Archbishop Theophanes in his behalf. He at first experiences some disappointment on learning that he will not be placed in the Academy itself, but in the Gymnasium attached to it; but he is now at all events in the road he has so long been anxious to enter, and has only to prosecute his studies and gratify his yearning for both physics and mathematics. Matters go on so smoothly that the reader grows apprehensive of a calm, and of the narrative itself becoming only some extracts from a

collegian's log-book. To avert this most terrible of all disasters, the author here brings another character upon the stage,—we presume a fictitious personage,—named Vinogradov, the one among his companions with whom Lomonosov forms the closest intimacy. To this his new and first friend he relates the history of his boyhood, and the circumstances attending his flight from his native village; by this means the biography is completed, up to the date at which the first chapter takes it up.

This fictitious auto-biography may, perhaps, be deemed more exceptionable and hazardous than the general plan itself. Auto-biography is the most alluring and fascinating of any; it is capable of conferring a powerful interest upon incidents in themselves unimportant and even trivial; and the minuteness otherwise producing only tedium, here serves to heighten the spirit and eloquence of the writer, who reveals, as far as language can, the actual impressions of his own mind. He dives into the depths of his proper existence, and brings to light much that lies in the hearts of all; but that lies buried there without voice to give notice of its existence. We need not refer to Rousseau, Alfieri, and others equally known, but cannot omit mentioning Rahbek's "Erindringer af mit Liv," as a delightful specimen of personal biography, and more especially in the earlier portions. Doubtless both a similar kind and an equal degree of interest may be imparted to a work of fiction so moulded; but then the value arising from truth no longer exists. However complete the deception, however tasteful their design and forms, gilded frames are not gold, nor artificial stones gems. Fictitious auto-biography is a contradiction in terms; and though allowable enough for the novelist, becomes falsification rather than fiction when attributed to a real individual. We give nevertheless a passage or two from this portion of Polevoi's book, to afford our readers the means of judging how it is written.

"I was about ten years' old when my father first took me out to sea with him in his fishing vessel. Conceive what an event for me at that age! Steering our course as far as 70 degrees north latitude, I had leisure to contemplate some of the grandest spectacles, the most magnificent phenomena of nature, such as perhaps I shall never behold again. A boundless expanse of waters—not those of the Finland Gulf, but of the vast Northern Ocean, presented to me a scene I was never wearied of gazing upon. During a calm, it delighted as an image of perfect tranquillity and repose; yet I loved better to behold it agitated by the storm, upheaved from its depths, when its

surges dashed over our vessel and tossed it to and fro on the swell of waters, as if it was their toy—a mere splinter of wood. At such moments I fancied that the elements were stirred up by passions like our own; that in its wrath the sea wished to punish, by engulfing them, the daring mortals who, braving its power, had defied the dangers of its surface. The whitening foam, the shrill whistling of the winds, the fierce encounter of wave dashing against wave—all had for me a mystic language, devoid of meaning to the understanding, yet full of expression to the soul. Earnestly was I wont to listen to it, yet was filled with gladness when such discord of the elements abated, when the wrathful ocean desisted from its chidings as I fancied them, and lowered its voice to a gentle whisper. Again all was placid, and we glided over a glassy mirror. Even these seasons of calm were not without their wonders, or their dangers. Sometimes would rise upon the unruffled surface a huge mass, which on nearer approach we discovered to be one of the giants of the deep, floating upon its upper confines."

Passing over what is said of whale-spearing, and of the risks encountered among masses of ice in those seas, it will be more to our purpose to quote from the account here given of Lomonosov's early passion for reading. Having exhausted the library of his instructor, the parish priest, whose collection was confined to a few volumes of a religious and devotional cast, he is fain to borrow what books he can from the Raskolniks, or Dissidents, in the neighbourhood, who it seems willingly accommodated him in the hopes of gaining a proselyte. What kind of reading their bookstores supplied; whether any likely to attract a boy eager for information; or what disgusted him with those to whose friendly offices he was thus indebted, are points on which no information is afforded; in consequence of this reticence all that is said here on the subject is exceedingly unsatisfactory and obscure. Continuing this part of his youthful history Lomonosov is made to say—

"After I had separated myself from the Raskolniks, I began to look upon their books with aversion. In the meanwhile I was consumed by a thirst for information. I had long before read all the books that belonged to our parish church; and therefore again made application to my friendly instructor, entreating him to lend me some books on other subjects: but he replied that he had none, and that in fact there were none such in the Russian language;—if, therefore, I wanted to gain instruction from books, it was requisite that I should first of all study Latin. 'What is Latin?' asked I, 'and how may it be learnt?'

'Latin is a language in which there are books on all sorts of learning; and for Latin, there are schools at Moscow, Kiev, and Petersburg.'

"This first suggested to me the idea of going to Moscow; yet how was the scheme to be accomplished? I dropped a few hints of such intention in order to see whether my father would be likely to concur in it; but as soon as he comprehended my drift, he raised such a storm, that I hardly knew how to appease him. My malicious step-mother only made matters worse: not content with agreeing with my father as to the folly of the scheme, she began to lament that her husband should have such an ungracious, 'ne'er-do-weel' of a son; in short, to make a most terrible hubbub, till at length the old man was on the point of turning me out of doors. The affair terminated by my getting sundry slaps and blows, and being ordered to drive all such whims and nonsense out of my head.

"But fate, it seems, was determined to keep alive my passion for reading, by adding fresh fuel. Being at the house of Christopher Dudin, one of the wealthiest men in our village, I chanced to spy out some books that were not devotional offices or things of that sort. This discovery, I well remember, threw me into a fit of ecstasy; with what rapture did I turn over their leaves, almost devouring them with my eyes. You, of course, long to know what books they could possibly be?—an old Slavonic Grammar, and a treatise on Arithmetic printed at Petersburg, in the reign of Peter the Great for the use of nautical students. Both the language and the subjects of those books were then quite a mystery to me, but a most captivating one. More than once did I implore Dudin to lend me those precious volumes; no entreaties, however, could obtain from him this favour, not even for a few days. I therefore resolved to get possession of them by stratagem, and with this view, to make myself as agreeable as I could to his two sons, I became their play-fellow, made them toys, amused them by telling tales, till at length they were ready to do whatever I asked. When I first mentioned the books I had seen, requesting them to bring them to me, they hesitated; but by dint of entreaties I prevailed. The long-sought prize was now my own; those precious books were thenceforth my inseparable companions; I read them every day and every leisure hour of the day, till I had them perfectly by heart. They were for me the doors into the temple of knowledge."

Throughout the whole narrative here put into Lomonosov's mouth, the author appears to have been checked by fears of forsaking the character of a biographer, if he filled up too freely the scanty outline afforded by his materials. It is like an attempt to copy an unseen picture from a print, where the colouring has to be supplied by guess. Cer-

tainly there is very little colouring here, very little of freshness and variety of tints.

We must now follow Lomonosov and his fellow-student, Vinogradov, to Marburg, there to be instructed in chemistry and mining, and to attend some courses of philosophy under the celebrated Christian Wolf. This course of study promises ill for the interest of the narrative, or for anything in the shape of adventure; nevertheless it is at Marburg, amidst philosophy and professors, that we meet with the most novel-like chapters in the whole work. Lomonosov falls in love with the daughter of the tailor at whose house he lodges. On this occasion the author has given freer reign to his imagination, describing the various scenes of this episode at some length, and with considerable effect; elsewhere, we should commend them for the nature they display, but here they detain us too long from matters of higher importance in a literary life. Notwithstanding the father's positive refusal of consent, and his friend's remonstrances on the indiscretion of such a step, Lomonosov marries Christina, and is for awhile satisfied and happy. He not only applies himself with fresh diligence to his professed studies, in which he had been very remiss while engrossed by an interest that excluded all others, but occupies his leisure in endeavouring to improve, or rather establish, the system of Russian versification. He succeeds almost beyond his hopes, and produces his *Ode on the Taking of Khotiu*, which he sends to St. Petersburg. A literal English translation of this piece is to be found at page 628 of our First Volume, though no translation however ably executed can express the beauties and peculiarities of the original language and the structure of the composition. This production, so different in style from anything that had preceded it, and in which Lomonosov had taken for his model Günther's* *Ode to Prince Eugene*, might have obtained for its author the immediate patronage of the Russian court, had not the death of the Empress Anne taken place shortly after.

This season of tranquil enjoyment, during which his fireside evenings are devoted to the study of German and French literature,

is of no long duration. First come vexations and perplexities, then more pressing embarrassments. For awhile Lomonosov goes to Freyburg, where he studies metallurgy and mining under Berg-Rath Henkel; on another occasion he visits the Harz mountains for a similar object; and on his return from this latter excursion finds matters at home desperate. His wife, now a mother, is no longer the blooming Christina, but worn-out and dispirited by constant anxiety: while his creditors become daily more and more importunate. He therefore determines to evade them and make his way into Holland, and from thence to St. Petersburg. An unforeseen danger, however, awaits him: he falls into the hands of a Prussian enlisting corps, is forcibly detained as a recruit, and kept so strictly watched, that only after a considerable time and at the utmost peril of his life he effects his escape, and reaches Amsterdam. From hence, through the friendly offices of the Russian ambassador, he obtains a passage to Petersburg.

With this event concludes not only the first volume, but all the romance of Lomonosov's history, which taken as romance is dry and tedious. The second portion of the work is almost of a distinct character from the first, at least its interest is of a different kind; and recommends itself to us by a quality not likely to ensure much favour with those who turn to it as to an ordinary tale or novel, for it throws some light upon the state of letters at that period, and, though desultorily, brings us acquainted with several characters of more or less note. At the time of Lomonosov's return the Empress Elizabeth Petrovna had just mounted the throne; but of the revolution which placed her on it no mention is made, though it was one which, even as simply related by the pen of history, is replete with such strong interest. During the twelvemonth succeeding the decease of the Empress Anne, that is from Oct. 17 (28), 1740, to Nov. 25 (Dec. 6), 1741, the Russian court and capital were the scene of a series of political intrigues, conspiracies, and counter-conspiracies, arrested only by the decisive measure at length taken by Elizabeth, who, by advice of her favourite Lestocq, caused the infant Ivan, together with his mother the Regent Anna Karlovna, and her consort Peter Ulrick of Brunswick, to be seized, and herself proclaimed empress. Of the fall of the Regent Biron, who was actually dragged from his bed in the dead of night; of the disgrace of Munnich; of the subsequent banishment of these two powerful rivals, we hear nothing, not even by way of reference or allusion. The name of Elizabeth herself is mentioned

* Günther was one of those characters who are well fitted "to adorn a tale,"—who, gifted with talents and unchecked by principle, throw themselves as vagabonds upon society and submit to be shuttlecocks of fortune. His habits of intemperance, disgraceful and degrading, unfitted him for everything. The appointment of court poet had been obtained for him at Dresden, but when admitted into the presence of the king, he was so intoxicated as to be unable to utter a word. After wandering about from one town to another, he died at Jena, in 1723, at the age of twenty-eight.

in one or two places, and we are allowed a glimpse of her in the scene where Lomonosov is introduced at Zarkoe-Selo; but her personal character is, perhaps discreetly, kept out of sight. If there be any truth in history, her dissoluteness was full as great as that of the Second Catherine, and even more openly scandalous. Abandoned to disgraceful amours, it was not so much her personal ambition as that of her favourites, seconded by her own apprehensions, that at length induced her to seize the crown.

To return to Lomonosov. The attestations he brings with him from Germany, together with the letters from Amsterdam, immediately procure for him a place and a salary at the Academy of Sciences; and he shortly afterwards obtains an appointment as Adjunct-Professor of Chemistry and Physics. Even this degree of success, however, is followed by great discontent, not as regards himself personally, but because he does not find that earnestness and activity in the cause of science which he had expected. Some of the professors are men of ability, and all perform the duties required of them with due attention. But there is a lack of energy and enterprize in all their proceedings, a want of unity of purpose, that provokes if it does not discourage him. He is impatient to achieve for science what Peter did for the empire:—to re-model, improve, extend,—to legislate afresh, and introduce more efficacious modes of instruction. In short, he is urgent that the Academy should do something more than its mere duties,—should enlarge the scope of these, and provide courses of instruction in Eloquence and Poetry, History and Antiquities both domestic and classical; so as to comprehend that cycle of knowledge which he himself strove to embrace. His remonstrances obtain no more satisfactory answers than “wait a little,” and “in time.” If, however, he finds few supporters within the Academy, he meets with some powerful patrons out of it. Foremost among these are Count Peter Ivanovitch Shuvalov, and his relation the young, talented, accomplished, and generous Ivan Shuvalov, at that time a page in the court of Elizabeth, but since immortalized as the Mæcenas of letters and arts in the age of Catherine II. In the meanwhile he had some pleasant rencontres, as the following anecdote will show. It should be observed that most of the professors at the Academy were Germans, and very few of them at all acquainted with the Russian.

“On one occasion, one of his learned colleagues, whose well-powdered wig gave him a consequential air, told him that it was his intention to compose a work on Russian

Literature, the materials for which he was then collecting. To this piece of intelligence, which was communicated as an important secret, he added, do not fail to call upon me to-day, in order that we may have some conversation together about this undertaking of mine.

“Lomonosov was filled with astonishment at what he had heard, being well aware that the intended historian of Russian Literature understood scarcely three words of the Russian language; curiosity, however, induced him to pay the requested visit. The professor received him most cordially, offered him a pipe and glass, and then drew forth a paper containing a list of questions written in German, beginning as follows:—

“What is the Russian word for *Literature*?

“What Russian authors have written upon its history?

“What books are there in Russian, which treat of the subject?

“Do the Russians write now as formerly, or has the language undergone any changes?

“On hearing these singular queries, and many others of the same sort, it was with the utmost difficulty that Lomonosov could keep from bursting out into laughter; for it was clear that the learned professor and future historian ought to go and study the Russian alphabet, as a first and necessary step towards collecting *materials* for his important work. Nevertheless he contrived to check his risibility, and replied with as much gravity as he could muster up.

“‘My good sir, these will go but a very little way; you require a much larger stock of materials to commence with.’

“‘Well, I am getting them together as fast as I can. My plan is already adjusted; I have determined upon the system I shall follow; all therefore that I now require is, names and dates. There is very little you see now to do;—you approve of the idea; that is enough!’

“‘But how can you have formed any system, when you yourself are quite ignorant—that is, unacquainted with the subject itself?’

“‘Unacquainted with the subject! What has that to do with the matter? The first thing is to settle the system,—all the rest is easily come at. The plan has occupied me half a year; and it may possibly be two years before the work itself is completed,—for that I will not answer. However, let us proceed methodically; let us take the questions I have set down, one by one.’

“‘Would it not be better for me to write down the answers at once with my pencil on the margin?’

“‘Oh! no, no! I shall want all the margin for my own annotations. Now do let us proceed methodically; have the goodness therefore to tell me again, what is the Russian term for literature?’

“‘It is precisely the same, *litteratura*, unless you prefer *slovestnos*.’

“‘Aye! that’s it, *zlovestnos*.’”

“Lomonosov was about to point out his odd mistake, but checked himself, thinking it would be an endless task to set the learned professor right every time; and therefore let him go on heaping blunder upon blunder.”

This most certainly seems downright caricature; but we have met with instances which almost surpass it in absurdity.

Two years pass away before Lomonosov thinks of sending for his Christina and her little Minna to come to him; nor does the separation seem to occasion him particular concern. We are, it is true, assured that his still straitened circumstances have prevented his sending for his wife; yet further than this it appears to be a matter of perfect indifference, if not to himself at least to his biographer. However needless to display the more sacred feelings of the mind to vulgar readers of biography in general, in an imaginative work like the present some trace of emotion would surely not have been misplaced. Well might we say that the romance concluded with the first volume, when we observe so chilling a contrast between the enthusiasm of the impassioned lover and the staid prudence of the married man. The same Christina who is so important to the novelist becomes a mere cypher for the historian, who with more truth than poetical flattery tell us that notwithstanding Lomonosov continues attached to his wife, he esteems her as the prudent mistress of his family, the tender mother of his child. What has become of all those sunny, rainbow-tinted visions of ever-blissful rapture that presented themselves to the enamoured Marburg student as imperishable realities? Still we are far from censuring this terrible falling off as partaking of inconsistency; we only regret it should be so very natural and common a case; one, too, that would take place in all novels, did not novelists until lately invariably make a point of not exhibiting those whom they have paraded as lovers, in the prosy characters of man and wife.

But we must abandon the task of following the biographer step by step, and attend chiefly to what is more immediately connected with Lomonosov’s literary life, his pursuits and productions. He is in general known merely as a poet, yet an erroneous estimate has been formed of his powers in this respect.

* The drollery of the blunder cannot be expressed in a translation, for *zlo* means *bad*; therefore as far as it has any signification at all *zlovestnos* would mean *badness*. More force of equivoque might be obtained by converting *zlovestnos* into *slovenliness* as the synonym of *litter-ature*.

“He assured others,” says Polevoi, “and perhaps really believed that poetry occupied him merely as a relaxation and amusement, while science engaged his unremitting exertions, and was the task to which he bound himself; the fact was precisely the reverse. His task was poetry: he wrote verses according to the rules of rhetoric. Take up the best of his odes and you will find it modelled perfectly according to rule, and decked out with rhetorical figures and embellishments; but hardly will you discover in it any genuine enthusiasm—any real warmth of inspiration. In his scientific writings, on the contrary, how many grand and bold ideas present themselves! And with what intense ardour of feeling, with what complete abandonment does he appear to have devoted himself to such studies! Nature expressly formed him to shine in that sphere, and his whole life affords proof that he readily obeyed her impulses.”

“His own attachment to science led him to regard with sincere affection all those who devoted themselves to its cause *con amore*. It is true he met with very few such among his colleagues, but of those few he became the warm friend. The one with whom he connected himself most intimately was Professor Richmann, a German by birth but a Russian in heart; a warm lover of his new country. The similarity of their studies united them still closer, for Richmann was Professor of Physics and Natural Philosophy; to these pursuits he addicted himself with extraordinary diligence, and engaged in a variety of new and important experiments, which he freely communicated to Lomonosov, who, notwithstanding the variety of his other acquisitions and pursuits, took more especial interest in whatever related to the study of nature and its phenomena.”

“Their intercourse was not long in ripening into friendship, cemented by the most cordial sympathy of tastes and opinions. So far from contenting themselves with performing what lay in the course of their duties, they extended their views beyond the limits of their studies. The theory of electricity had then been recently started; it was a subject that engaged the earnest attention of both; and while they regretted that they were so badly provided with the means of prosecuting their researches, they complained more bitterly than ever of the slow progress made by the Academy, of the dilatory course adopted, and of the apathy of their colleagues.”

Although the event itself does not occur till a later period of the narrative, we may as well briefly notice in this place the death of Richmann, who fell a victim to his enterprise in the cause of science, being killed by lightning while making an electrical experiment, during a tempest, in July, 1753. Notwithstanding that this melancholy occur-

rence was severely felt by Lomonosov, it did not damp his ardour nor deter him from prosecuting his own inquiries on the subject; and what interest he took in it will be evident from a conversation with Richmann shortly before the fatal accident just mentioned.*

"Do you know that our theory has already been investigated?"

"By whom?" hastily inquired Lomonosov.

"Oh! certainly by no one here at St. Petersburg. But guess where."

"In Germany?"

"No, in America, at Philadelphia."

"Surely you are not in earnest?"

"Here is an English book, which gives an account of our theory," said Richmann, putting down on the table a volume entitled *New Experiments and Observations on Electricity*. "The author, who is an American printer of the name of Franklin, astonishes me by the penetration he displays. Like us, he has long occupied himself with electricity and the nature of the *Aurora Borealis*, yet the work is but lately published."

"And when did it first appear?" asked Lomonosov, with the anxiety of one who is on the point of losing the honour of a discovery.

"Two years ago: see here the date 1751."

"And are you quite sure that his theory agrees with ours?"

"So it would seem. However, at present I have only glanced over the book, being anxious to lose no time in informing you of it. We can now examine it together more carefully."

"But you know I cannot read English. How vexatious and stupid it is that people do not write scientific works in Latin?"

"How interesting," continues the author, "to observe the sympathy of genius existing between two such master-minds as those of Franklin and Lomonosov! Both wrote upon the same subject, made nearly the same experiments, and in more than one instance arrived at very nearly the same discoveries. But the man who stole lightning from heaven, as D'Alembert calls Franklin, had long made both electricity and meteorology his study; while Lomonosov on the contrary had been able to devote to it comparatively but little time, taking it up only at intervals, among a number of other learned and scientific pursuits: nevertheless he developed many ideas similar to those of Franklin, although he was utterly ignorant at the time of what the latter was doing. It is enough to say that among the numerous titles of Lomonosov to fame, his labours in electricity constitute one; for he afterwards satisfactorily proved that he was not aware of those of Frank-

lin, and that his own theory, respecting the electrical matter of the atmosphere, is nowise indebted to the American."

After many other proofs, he adds:

"My ode on the Northern Lights, written in the year 1743, and printed in my '*Rhetoric*,' in 1747, contains my opinion on that phenomenon, as produced by the motion of the ether in the atmosphere."

We possess a still more convincing proof in Lomonosov's own character: least of all men was he disposed to take to himself the credit of the labours and discoveries of others. Whatever he did was his own; it was the product of his genius, and remains the property of his age and country. Nevertheless it is a most singular and interesting coincidence that the same ideas should at the very same time have presented themselves to two of the most remarkable men of the eighteenth century, who had no intercourse with each other—Franklin and Lomonosov.

We shall not suffer the various jealousies, bickerings, and squabbles between Lomonosov and his brother academicians to detain us, further than to remark that Trediakovsky, whose literary reputation is akin to that which Blackmore enjoys among ourselves, entertained a feeling of strong personal enmity towards Lomonosov; and that Müller the historiographer had on one occasion a serious fracas with him, which is detailed at some length.

We pass on to the celebrated Alexander Sumarakov,—celebrated, because, although not gifted with any extraordinary talents, his name is certainly one of permanent historic note in the annals of Russian literature. Not only was Sumarakov a very prolific writer, but there is scarcely any department of poetry, except the epic, which he left un-essayed. From tragedy down to farce, from psalms and hymns to burlesque odes, from satires to songs, from elegies to epigrams, every form of composition was exercised by him: so far he was useful in his generation, and was doubtless the means of exciting others to more successful efforts. He is one of those who, being overrated by their contemporaries, are as much undervalued by posterity.* And yet some of his pieces

* It deserves, perhaps, to be here mentioned that of the prose pieces printed among his works, two have lately been claimed as belonging to others: viz. the Dialogue between Montezuma and Cortes, which is asserted to have been written by Marshal Suvarov, and to be his only literary attempt; it may consequently pass for a curiosity. The other is the oration delivered by the architect Bazhanov, on laying the foundation of what was to have been a new palace in the Kremlin at Moscow; this piece, it is supposed, may have been corrected by Sumarakov:

* Kheraskov has alluded to it in his *Rossiada*.

are far from contemptible; and though his diction and versification are upon the whole somewhat antiquated, many exceedingly happy and well-turned expressions are to be met with in his works. It has been too much a sort of fashion to censure Sumarakov indiscriminately; the consequence is that the reader takes him up with prejudices ill calculated to lead to an honest estimate. A more liberal critic in the *Otechestvennaya Zapiski*, says, "it may fearlessly be asserted that Sumarakov's works are so far from being contemptible, that even at the present day we have very few indeed that would not suffer by a comparison with them." Bowring, on the other hand, tells us that "his dramatic compositions are for the *most part* gross and indecent;" from which we suspect that he was entirely unacquainted with him. His farces, it is true, are occasionally coarse in expression, but not a whit more gross, and certainly far less immoral than many pieces not only tolerated but applauded by our refined and moral public. Even in the work before us Sumarakov is not exhibited in the most favourable light, probably on account of his having been in some respect the rival of Lomonosov.

"Sumarakov had written a great deal. His tragedies were performed by the cadets, and afterwards at court in the presence of the empress, to whom they gave great satisfaction. This success so flattered the vanity of the young author, that all his thoughts were now directed to the establishment of a permanent theatre; and accident befriended his scheme. In the seclusion of Yaroslavl, Volkov, the son of a merchant at Kostroma, had built a theatre; that is, had erected a stage almost literally with his own hands, painted the scenery, got together a company of performers, and astonished and delighted his country audiences. Who would have imagined that the Russian stage would have for its founder a merchant's son in an obscure country town? So, however, it was: but then much of his success must be ascribed to the talents of his company, to Dmitrevsky, who afterwards obtained the name of the Russian Garrick, to Popov, Shumkoi, &c. The fame of their performances reached Petersburg; Sumarakov lost no time in engaging them, and by the aid and credit of his connections was enabled to carry his project at once into effect. His father, Peter Pankratievitch, was a man of some consequence, and held a situation near the person of the grand duke; and Sumarakov himself, who was by no means easily daunted or repulsed where he had a point to

carry, pushed the matter so actively among those who had any influence at court and in the higher circles, that they did all they could to aid his scheme. In the meanwhile his pen was not idle; he obtained public notice as a poet and was greedy of more; on which account Lomonosov was a thorn in his side, because, without the aid of friends and partisans, he manifested himself his superior in talent, and what was still worse, ridiculed his attempts at poetry, as a silly passion for writing verses."

It would thus seem that there was a considerable degree of pique and jealousy on both sides; nor on that of Lomonosov were such feelings particularly justifiable, for it would have been more consistent with his general character to have encouraged as far as was in his power any manifestation or even symptoms of talent among his countrymen; more especially when he himself felt how many disadvantages and obstacles literature and science had then to contend with in Russia. But we are told that Sumarakov looked upon the drama, and tragedy in particular, as a sort of property of his own, one in which he had an indefeasible and vested right; therefore as soon as he learnt that Lomonosov was engaged upon his tragedy of *Demophon*, he told every one that his rival was copying and borrowing from him. The biographer himself, however, is obliged to acknowledge that—

"These apprehensions were altogether groundless, there being in reality nothing to fear. As was the case with the greater part of his poems, Lomonosov sat down to the task of writing his drama without any kind of internal impulse. He engaged in it at the advice of Ivan Shuvalov, who seeing the success of Sumarakov's theatrical pieces, and finding that they were greatly relished by the empress, was anxious that his friend and protégé should display his talents and superiority in that as well as other walks of poetry. Thus originated, it was hardly likely to prove a really poetical production; and in fact it is not only weak and spiritless but even dull and below mediocrity. It is incontestible that Lomonosov was not gifted with the slightest degree of dramatic talent; and after his first experiments he desisted altogether from farther attempt."

This being admitted, Sumarakov might surely have been treated with a little more consideration; particularly as we afterwards find that he made conciliatory advances to his rival. To lower him more than necessary, when in one, and certainly not the least difficult or important department of poetry, he was confessedly superior to Lomonosov, is not the way to exalt our opinion of the latter. Could we be certain that Lomonosov would have materially added to his fame by

the manuscript being found among his papers, might have led his editor, Novikov, to give it a place among his works.

employing his pen more frequently on literary and poetical subjects, we should regret that he did not do so, instead of occupying himself, as at one time, so much with mosaic painting. For a long while he suffered this fancy—we can scarcely term it any thing else—to engross his leisure and divert him from all except his duties as professor in the Academy. He was constantly importuning his powerful friends Woronzov and Shuvalov, to prevail upon the Empress to furnish funds for conducting experiments upon a large scale, and establishing a mosaic manufactory. Though we cannot but admire the variety and extent of Lomonosov's inquiries, and his excursions into all the neighbouring dependencies of science, we cannot help regarding it as a waste of time, when he applied himself with so much assiduity to what is so mechanical as a branch of art, and so tedious in execution. Had he directed his attention to it merely with the view of discovering improved and more economic processes it would have been different; on the contrary, he actually occupied himself, at intervals, for months and years in operations from which nothing more important resulted than some pattern specimens of his workmanship, and a picture, we are told, representing the battle of Pultava, intended by him for the church of St. Peter and Paul. Some of his friends indeed remonstrated against his thus misapplying his time and talents, instead of proceeding with his History of Russia; but Lomonosov contended that these occupations were peculiarly connected with his chemical pursuits, which had led him to the discovery of a better mode of preparing the requisite materials. Certain it is that these hobbyhorses avocations gave rise to his poem *O Polze Stekla*, (on the Usefulness of Glass,) written in the form of an epistle to Shuvalov, wherein he has enumerated and described the various services of a substance whose commonness causes us to overlook its value. They who are disposed to condemn all poetry of this class will hardly make an exception in favour of this production of Lomonosov's, which cannot be said to contain any very striking passages, or much poetical ornament: yet the subject is by no means without its poetical aspect; for what other human invention has so materially assisted the sciences, revealing to us the wonders of creation from the most distant of discovered planets down to the minutest insects?

Among the biographical pencillings interspersed through the volume—portraits they can hardly be called—that of Popovsky will at least serve to show of what materials the latter portion of the work is constructed.

"While his enemies were thus annoying and persecuting Lomonosov, he unexpectedly discovered an individual after his own heart. Among his pupils was a young student named Popovsky, whose quickness of talent and more than ordinary literary abilities had not escaped the Professor's observation; though he did not fully know what he was capable of producing, until Popovsky ventured to show him his elegy entitled *Zemlya* (Winter). On perusing it Lomonosov at once perceived that there were in it flashes of real talent. This agreeable discovery and the attachment the young poet evinced towards his preceptor, brought the Professor and his pupil into a closer intimacy. The mild and pensive character of the latter, and the fiery, impetuous nature of the former, sympathized in the love which they bore in common to literature.

"Popovsky's poetical style accorded perfectly with Lomonosov's ideas, because he had penetrated into and adopted his mechanism of versification; nor was the Professor at all displeased to find that he himself had been taken as a model. In fact, at that time the real road to poetry was ill understood; it being fancied that the imitation of what was good in itself could not possibly produce what should prove to be bad. Popovsky considered that by imitating Lomonosov he was following him; but the latter advised him to select other models. 'Take courage,' said he, 'and translate something from Horace.'

"'From Horace?' exclaimed the astonished youth, 'how is that possible, when we have as yet not a single poetical translation in our language?—and yet you advise me to make the attempt with so consummate a poet as Horace, the most finished and accomplished classic model!'

"'So much the better—you will then have the honour of being the first to translate a classic author into Russian verse.'

"'I dare not make the venture.'

"'Young man, you do not yet know what you can do. You do not know the strength of your own abilities. Proceed fearlessly, and success will attend your efforts.'

"'The pupil determined to show at least his docility; and in the course of a little time brought Lomonosov a translation he had made of one of Horace's Odes; of no very great merit in itself it must be owned, still the first translation of the kind in Russian. At present it is hardly possible for us to appreciate the value of such an attempt, or the difficulties attending it. Nay, if we take into account what was then the state of our language, how unpolished, and how ill adapted to express with any kind of grace even ordinary ideas;—if, further, we make allowance for the reverential prejudice in which the classics were held, we must in all fairness admit that Popovsky had accomplished something extraordinary, and that Lomonosov was justified in congratulating the young poet on his success.'

In the course of time Popovsky brought

under his arm another young aspirant to poesy and the bays, and whom he introduced to Lomonosov as Mikhael Matvievitch Kheraskov. The latter was rather scandalized—at least in no small degree astonished—at the uncerecermonious freedom wherewith Lomonosov expressed himself with regard to two of the literary celebrities of the day.

“‘You have not the honour of being acquainted with M. Sumarakov.—It is a pity, for he certainly is a very great man indeed!’ said the Professor, laughing very heartily.

“‘You may jest as much as you please,’ observed Popovsky, ‘but for all that, his fame spreads everywhere; the whole town talks of him.’

“‘The whole town talks of him, does it?’

“‘Yes: the actors he sent for from Yaroslavl, have just been performing one of his tragedies at court, and there was no end to applauses.’

“‘Indeed!’

“‘Yes, I assure you it is a positive fact. The Empress herself expressed her entire approbation, both of the performers and the piece.’

“‘If such be the case, our friend Sumarakov will certainly burst with conceit.’

“‘But, Professor, (Kheraskov ventured to ask,) will not you yourself allow that there is great talent displayed in M. Sumarakov’s tragedies?’

“‘Forcing a smile, Lomonosov replied: ‘Some folks may find talent in them, but I should be very glad to discover anything at all in them.’

“‘Permit me, however, to observe that they are written in strict conformity with the plan adhered to by Corneille, Racine, and other great tragic authors.’

“‘I congratulate M. Sumarakov on the resemblance they bear to such eminent poets; though I could never fancy they resembled anything except the productions of his friend Trediakovsky.’

“‘What then, in your opinion, may M. Trediakovsky be?’

“‘An ass.’

“On hearing this decisive though laconic reply, poor Kheraskov’s face betrayed the utmost astonishment, and he was unable to utter a word; while Popovsky smiled, and Stellin, who laughed out heartily, exclaimed: ‘Envy—sheer jealousy and envy, my good friend. Besides, how can you allow yourself to fill these young people’s heads with such very free opinions?’

“‘I speak exactly what I think.—Would you have me disguise the truth from young men?’

“‘By no means, but yet—’

“But yet, indeed! But I say that if people had the honesty to tell stupid authors that they write stupidly; and are stupid fellows, we should be troubled with fewer of them. Here we Russians have just begun to learn our alphabet, and have got already a whole swarm of rhymers and verse-makers.’

“This last remark sounded by no means agreeably to Kheraskov’s ears, for he had then got a copy of verses in his pocket, which he determined should remain there, and not meet the frown of so severe an Aristarchus. Stellin almost immediately after took his leave, whispering to his friend as he quitted the room: ‘I would make any bet that that lad has an itch for poetry.’ Lomonosov smiled, then turning to his two young visitors, renewed the conversation, in the course of which he spared neither Sumarakov nor Trediakovsky. Kheraskov hardly believed his own ears; for he had always found much to admire in both; and indeed held them nearly in the same rank with the great man whom he now had the honour of approaching.

“‘It is very evident,’ observed he to his companion, as soon as they had got into the street, ‘that M. Lomonosov is no friend either to Sumarakov or Trediakovsky; and yet I should be exceedingly happy to be able to write as well as they.’

“In these words we have the full character of the future author of *Vladimir*, the *Rossiada*, and a dozen other heavy and wearisome productions.”

This censure is by far too sweeping and severe; and besides agrees very ill with the mitigating plea which the author himself offers in behalf of Popovsky’s translation from Horace. Most certainly the *Rossiada*—the only production of Kheraskov’s we ourselves have read—is not distinguished by eminent talent, but it is not deficient either in dignity or interest, and contains several spirited passages and ably-conceived scenes and descriptions; among others, those of the land-storm and the dreadful drought which threatened no less than the destruction of the Tzar’s army on its route to Kazan. The prophetic vision which Vassiau, the holy hermit, displays to Ivan, is as good as most poetical machinery of the kind. It must be admitted that the interest flags considerably in the last canto: still, with all its deficiencies, the *Rossiada* is quite as good, if not a better, specimen of the epic than the *Henriade*, almost the only one of which French literature affects to boast. Nay, though decidedly inferior to the *Lusiad* in poetical colouring, the narrative contains as much action, while it is free from that incongruous application of heathen fiction and machinery, so disagreeable in the latter poem. We are countenanced too as regards the author of the *Rossiada*, by the high praises bestowed upon his epics by both Derzhavin and Dmitriev: the first of whom has not scrupled to call him the Virgil of Russia.

Derzhavin himself makes his appearance in a chapter of the work before us, where the author furnishes us with a muster-roll of some

of the company assembled at one of the Princess Dashkov's literary soirées.

"Schlotzer, who was then a fresh importation from Gottingen, bore about him all the marks of a raw German student just let loose from the university. There was, however, something in this young man—he was then barely twenty-seven—that announced the scholar afterwards so greatly distinguished by his labours and researches in Russian history. But the repelling sternness of his physiognomy, the severity of his character, and the bluntness of his language, did not at all recommend him to the literary society of St. Petersburg; so that after about a year's residence in our capital he had formed no acquaintances in it; nor did he seem disposed to except any individual from the abuse he bestowed in general.

"Very different was the character of Pheodor Emin, who has been described by turns as a Turk, a Tartar, a renegade: in fact Heaven only knows what he was in reality. He himself pretended to be a Russian Pole, that is a Pole of Russian extraction. He could speak several European and Oriental tongues; was clever and ready witted; and in some respects might be considered a very agreeable, though not what could be termed a very respectable personage, for his conduct was not of the kind that would bear to be scrutinized. Nevertheless, as he was affable and accommodating with every one, he had every one's good word. Many strange and exceedingly mysterious reports had been bruited abroad concerning him, both as to his adventures, and his having been a renegade; but he himself affected to make very light of them, would laugh at them as absurd stories, and escape from any disagreeable remarks of the kind by the jesting levity with which he turned them aside. Besides, his youth seemed to contradict the multiplicity and variety of adventures laid to his charge.*

"Contrasted to the two preceding, was Prince Shierbatov, a polished man of the world, and accustomed to the best society; but who, having incurred the displeasure of the late emperor, and being in consequence

obliged to resign his command in the guards, now affected the philosopher, and aimed at the reputation of a studious and profound thinker. It is well known that he too was at this time engaged upon a History of Russia.

"Among others not entirely to be passed over in silence were Bulgakov* and Verevkin,† for in one sense of the term at least

* Yakov Ivanovitch Bulgakov, though mentioned very slightly by both Polevoi and Gretch, and merely on account of his literary productions, was so remarkable a character that we need scarcely apologize for introducing some further details respecting him. He was born at Moscow, October 15th, 1743, was fellow student in the university in that city with the celebrated Prince Potemkin, and the friendship thus formed between them continued for the remainder of their lives. Having completed his education, he obtained a post in the College for Foreign Affairs, and was afterwards sent, first to Warsaw as one of the commissioners on the part of the Russian government; next, in 1775, as marshal of the embassy to Constantinople, under Prince Repnin. In 1781 he was again sent to the Ottoman Porte, as envoy in his own person, and exercised his diplomatic talents with such address as to obtain the cession of the Crimea: but, in 1787, the intrigues of other powers prevailed so far with the Sultan as to induce him to declare war against Russia, and Bulgakov was imprisoned in the "Seven Towers," where he remained in strict confinement for seven-and-twenty months. He nevertheless contrived so far to elude the vigilance of his guards, as to carry on a correspondence with Potemkin and the Empress herself. The French ambassador, Choiseul Gouffier, offered to effect his release, on condition that he should immediately embark on board a frigate that was to be secretly in waiting for him; but he indignantly refused the proposition, saying that he would be indebted for his liberty only to the victories of his countrymen. In fact the successes of the Russians at Otchakov and Ismail determined the Sultan to release him without stipulations of any kind. It was during his imprisonment at Constantinople that Bulgakov translated the Abbé de la Porte's *Voyageur Universel*, in twenty-seven volumes; of which translation a fourth edition was published in 1813. Having regained his liberty, he proceeded by sea to Trieste, and from thence to Vienna, where he was received in the most flattering manner by the Emperor Joseph II. On his return to St. Petersburg, Catherine loaded him with honours and rewards; but at the same time new labours were imposed upon him. After visiting his relations at Moscow, where his father had died a few months before at the age of nearly one hundred, he proceeded to Warsaw, where he continued four years, when he solicited and obtained his recall. He now gave himself up to his literary pursuits until the Emperor Paul forced him once more to return to public life, by appointing him governor of Wilna. At length his health compelled him to solicit permission to relinquish his post, in 1799, and he retired to Moscow, where he continued to enjoy the society of many literary friends until his death, July 19, 1809. In his youth he had made a translation of Ariosto's *Orlando Furioso*, which was first published in 1797, and a third edition of it appeared in 1800. His letters, among which are several to Von Visin and other literary characters, are said to be admirable models of epistolary style.

† Mikhael Ivanovitch Verevkin, who died in 1795, translated Sully's *Memoirs* and a variety of historical and geographical works.

* At the time here referred to, Emin must have been about twenty-eight years of age, having, according to the biographical accounts given of him, been born in 1735. This adventurer—for it is hardly any calumny so to style him, is said to have embraced Mahomedanism, and to have served some time in the corps of Janissaries at Constantinople; and afterwards to have resided awhile in London under the name of Mahommed Emin. He wrote the 'Adventures of Lysarchus and Sarmanda,' and some other now forgotten romances; also a 'History of Russia down to the year 1213,' in which he is accused of having used the privileges of a romance-writer much too freely. Considering the character he bore, it is most astonishing to find that he was the author of a devotional work, entitled "The Way to Salvation." He died at St. Petersburg, where he held the post of translator in the College for Foreign Affairs, April 18, (30) 1770.

they were both great writers, their pens exhibiting a degree of literary industry which is even now by no means very common among us. Verevkin fully justified afterwards the distinction he thus earned for himself, since the translations he published in the course of his life amount to upwards of a hundred volumes, and are, for the most part, of useful and approved works.

"There were also present two young subalterns in the Guards, neither of them above eighteen; whose names were then cyphers, although they have since become immortalized in the annals of Russian literature. Novikov had greatly the advantage of his companion: his physiognomy was highly agreeable and expressive; his person well turned; his address prepossessing; his manner quick and animated: while the other was, to all appearance, quite the reverse—dull, awkward, and bashfully reserved, until he would suddenly become inspired, and give proof that both soul and intelligence were concealed beneath such an unpromising exterior. This other was—DERZHAVIN!"

For the breaking up of the party we cannot stay; but must leave Derzhavin sitting content with the character of listener throughout the evening, Lomonosov to talk with Novikov, and Bulgakov and Verevkin to read to the company extracts from their translation of the Orlando Furioso, and Sully's Memoirs. *Respite finem* is the maxim to which we must now attend; therefore without attempting to follow any further the chronology of Lomonosov's life, all we can now do is merely to attend at its close. This was in some respects melancholy and humiliating;—one which it is painful for the admirers of genius, not merely to contemplate, but to admit as a possibility. Although he had been eminently successful, and infinitely so beyond his earlier prospects, what he had accomplished fell very short of his literary hopes and ambition. When he compared what he had intended to do, and what he might have done, with what he had actually achieved, he felt mortified and disappointed. His former spirit totally deserted him; nor could all the honours heaped upon him by his new sovereign (Catherine II.)—all the sympathy she manifested in whatever concerned him, restore him to his former self. The mischief had proceeded to an extent that admitted no recovery. The means to which Lomonosov had had recourse, if not with the hope of recruiting his energies, at least of lulling his chagrins, served only to embitter and cast a deeper shade over the final scene. He had allowed himself gradually to acquire habits of intemperance, that grew by indulgence; and when, at the express command of the empress herself, he determined to break at

once their spell and fascination, it was too late. The sudden, and so far, perhaps, imprudent change from excess to complete abstemiousness proved too much for his constitution: he sank rapidly, and was carried off, April 16, 1765, when only in his fifty-fourth year, a period of life at which many eminent men have not passed their literary meridian.

We shall not detain our readers by attempting any general estimate of Lomonosov's talents and powers, but content ourselves with observing, that though the literature of his country is more indebted to him than to any other individual, he can hardly be said to have enriched it with any permanent monument of his genius. While the great advance of science since his time has rendered his writings of that class comparatively valueless, his fame as a lyric poet, in which character alone he courted the muses with particular success, has been greatly dimmed by the superior lustre of Derzhavin. In regard to the portraiture which Polevoi has given of him, we should certainly have been better satisfied with the work, had it been more biographical. By attempting to impart to it in some degree the interest of a novel, the author chiefly makes us feel how very far it falls short of one: the introduction of fictitious characters and merely imaginary incidents tends to throw a disagreeable suspicion over the authentic portions. Therefore while we confess to have perused it with considerable interest, as contributing some materials towards the history of Russian literature, we can recommend the work only to readers who are similarly influenced, and willing to accept information of that one kind in lieu of plot and action.

Readers of a lighter class might be far better pleased with "The Kholmisky Family," a novel published a few years since, and of which we have met with some entire chapters, given as extracts in a periodical. Judging from these we should say that it is by far the most natural and manners-painting production of the kind that has issued from the Russian press; one that conveys a livelier and truer picture of the actual state of society in that country, and of the domestic character of the people, than any other that has come under our observation. It may seem extreme presumption in us, who are at present so imperfectly acquainted with it, to say, that in camera-obscura effect it may be compared with some of Miss Austin's productions; but if it answers upon the whole to the specimens which have fallen in our way, it must have a good deal of the same quality, and is perfectly free from that caricature and extravagance which so disagree-

ably disfigure what would else be clever productions; but in which, as too often the case with those of Veltman, grotesque buffoonery is substituted for comic power and richness; and, for pathos, what are little less than the contortions and ravings of the mad-house.

ART. IV.—1. *Esquisse Anecdotique de l'Histoire de la Littérature Française, depuis l'origine de la langue jusqu'à l'époque actuelle.* (Historical, anecdotal, and literary Outline of the principal Writers of France from the Origin of the French Language and Literature to the present period). Par Achilles Albites, B. A. and B. L. de l'Université de Paris. 12mo. 1839.

2. *Les Siècles, ou Histoire Générale pittoresque des temps primitifs, de l'Antiquité, du Moyen Age, et des Temps Modernes; par une Société de gens de lettres; sous la direction de M. A. C. Albites, Avocat.* Tom. I. Paris. 1839.

THE first of these unpretending volumes serves the double purpose of offering a concise, historical outline of the literature of France, and affording us an opportunity of making a few remarks upon the nature and origin of the French language. Like the work itself, however, which might have been, we conceive, considerably extended not only without prejudice but with absolute advantage for the reader, our own remarks must be rapid and brief; rather touching upon some portions of the outline presented, and these too principally in its earlier portion, than assuming a detailed survey of the general subject.

Abjuring formally then, in the outset, the intention of building a formidable battery, historical and philological, against the brain and patience of unhappy readers, to the manifest infraction of their peace, and, for aught we know, that of our sovereign lady the Queen into the bargain, we shall nevertheless feel ourselves at liberty to point the Ithuriel spear of our inquiry, at will, against the body of that "fiend concealed" who has for so long a time lain whispering in the ear of the Historic Eve a series of unwholesome phantasies and lying dreams, that have served to alter materially the fair face of the actual world: and though we do not expect to elicit truth

"Sudden as the spark
From smitten steel, from nitrous grain the blaze,"

yet we do expect even in this slight introductory effort, a mere prelude as it is to more serious attempts, to break cover for studious inquirers, and, from the somewhat dubiously situated Paradise of Philology, to

"Start the fiend in native shape
Confounded and amazed."

Nor, we trust, need the lightest-reading of our readers recoil from this short canto of our Inferno, in fear either of the enemy to be assailed, or, what is more probable, of the guide that is to befriend him, or expect to leave Hope at the entrance.

M. Albites commences his work with the question "How has the French language arisen in the world?" And the answer he gives to this stands in the following words—

"The districts watered by the Seine, the Loire, the Garonne, and the Rhone, had in primitive times been peopled, as most of the other countries of Europe, by the Celtæ or Gauls, who came from the East, and by the Kymry, another Celtic tribe, who introduced among them the Druidical religion. Subsequently, in spite of her valour, Gaul no more than the rest of Europe, could escape the all-absorbing power of Rome. Fifty years before the Christian era, the victorious sword of Cæsar definitely subdued Gaul. From that moment she became *Roman*, in her institutions, manners, and language; so much so, that she supplied the Empire with many of those authors who gave some lustre to the decline of Latin literature."

We cannot seriously object in a work like the present, intended only for a slight and cursory view of French literature, that it does not enter into a more detailed examination of the first and preliminary question, since it would be a serious defect in a book intended for the multitude; but we must confess our surprise that more elaborate writers, expressly on philology, should not have taken the trouble of inquiring whence France derived that remarkable peculiarity of her dialect, which distinguishes it so widely from Europe in general; namely, its nasality.

We cannot afford space to enter largely into the matter here; but admitting, what no one probably can doubt, that all Europe has been peopled from the East, a fact established not less satisfactorily by physiology than by language, it next becomes a question whether any of the races that spread from the Orient to the plains of Europe indulged to any extent this nasal peculiarity, and how it was perpetuated to the French nation.

Of the Celtic tribes, who from the Pyrenees to the Rhine, and from the Alps to the Atlantic Ocean, peopled the west of Europe

in such early ages as to have been long considered the Autocthenes of the soil; and who, divided into two branches, the Galli and the Cimbri, formed, the first the states of the Edueni, Sequani, and Arverni, and the latter the Boii, Belgæ, and Armoricans;—extending hence into Britain on the one hand and Italy on the other; we have no literary relics to aid the present inquiry. The utmost that we know with any the slightest approach to certainty is simply this, that, dominated by the Latin, it formed the far-famed *Langue Romane*. We quote from our author:—

“But in the fifth century, Rome was no longer the queen of the world! The empire was invaded on all sides; Gaul fell a prey to the Franks, a Germanic tribe, and sunk, as almost every other country, into the deepest ignorance. The Latin language, though still partially preserved in monasteries, rapidly declined every where else and was transformed into a sort of jargon, which, on account of its principal source, was called *LANGUE ROMANE*, or Romance, the constituent elements of which were:—first, the old Gaulish; second, the Latin clipped and disfigured; and third, a sprinkling of the Teutonic introduced by the Frankish conquerors.”

Though the *Roman* was the earliest, it soon found a formidable rival in the *French* language, which was formed in the north of Gaul by a fusion of the vulgar Latin with the Teutonic idiom of the Franks: but it has been too much the custom for superficial writers to consider these two tongues as derived principally from the Latin, and by corruption; whereas it would rather appear that, as with the author before us, the first and most prominent place in their formation should be ascribed to the Gallic, or Celtic roots.

It is, however, in these two languages that we first trace a tendency to abridge the terminations of the Latin. We use the common form of words; but it is by no means clear to us that it properly conveys that sense we would attach to it; for if the Latin was not the principal root, is not the omission of the terminal syllable less a rejection of the Latin, by an abridgment of or refinement upon, that tongue, than an adherence to the older form of Gallic speech, to which that terminal was unknown?

M. Albites conceives, and with great probability and ingenuity, that the principle of rejection as to terminals was based upon preservation of the last long, or accented, syllable of the root, so as to give this, and this alone. In the words absolutely derived or retained from the Latin such most likely was the case; but this, we submit, was an

inferior portion of the language, from the arguments just adduced; and emanated, not so much from a fixed philosophical principle of grammar, as from the necessity of preserving, so far as practicable, an uniformity in the language; the larger portion of which, as our suggestions tend to point at, being Celtic, was destitute of these terminations.

With the last-mentioned race the elision of the terminal is owing also, in some material degree, to a principle not sufficiently kept in mind by philologists. Language when only orally retained, is subject to two processes of diminution, and one of them into two forms. The first of these is, a suppression of the vowel sound when existing to any great extent, as in the Greek, the Zend, and the Cingalese. The present pronunciation of the Romaic or modern Greek, and perhaps some, and possibly all, dialects of the ancient, have a direct tendency to the suppression of a too copious vocalization, such as reducing the diphthongs into simple sounds, the *oi* into *e*, &c. The same principle, and to a greater extent, is preserved in the Zend, whatever the date or authenticity of that language; and is even far more obvious in the Cingalese, where the vowels in writing are contracted into signs, and yet each word is of formidable length; but in the pronunciation it shrinks into semitic conciseness, giving little more than the consonantal sounds. These instances of contraction are the natural results of familiar intercourse between man and man.

The second tendency to which we have alluded, if arising in some degree from the same source, yet originates still more from an opposite cause; namely, separation and oblivion. As polysyllabic words are (we have elsewhere asserted*) only the aggregation of monosyllabic words;—and the Hebrew evidently has been, the Chinese as obviously is, proof of this allegation; so, in cases where the means of observation have been allowed, separation of men from their families or their fellow-creatures has been followed by elisions of speech; and in two forms; the initial, and the final, syllables: we need scarcely remind our readers that in the American penitentiaries, where solitary confinement had been carried to great lengths, it was found that the prisoner had lost both the commencing and terminating syllables of words; and that, in less protracted cases, it was only the final that were forgotten.

To reduce these instances to our present purpose it will merely be needful to observe, that the earliest forms of migration, like the

* No. 42, Art. Chinese and Egyptian Writing.

Welsh, probably never had, or if they had they lost, the redundant syllables; and wherever we fix the date of the more cultivated Celtic tongues, the approximation of their roots to the Latin never extends to the terminations. The Gallic, therefore, in its amalgamation with the Latin to form the two languages we have especially referred to, the *Roman* and the *French*, conserved its own principle, as established and derived from early migration.

In our present slight inquiry we cannot enter into the question of the source from which this termination was derived. We trust hereafter to show this, and to demonstration.

But since the derivation of European nations and tongues is from the East, it becomes necessary, in the second place, to inquire whether the nasality of the French is not recognizable there, and thus affords another instance of the connection of the East and the West.

The tongues of Hindostan immediately recur to us in putting this question; for there and in the Sanscrit especially, we find the nasal specifically marked and the nicer gradations of its utterance. If, through the Norman French of the Conquest our own tongue received this peculiarity in some degree, where the *n* consonantal lapses into the nasal, this into the fainter nasal of *m*, and sinks altogether silent in various words; as co-temporary or con-temporary; we must not, we suspect, be too fond of referring this to pure Latinity of derivation; the contractions of writing in the middle ages would not alone, certainly, bear out our suspicions, but they connect the point with the omissions of the nasal by Greek writers, as in *aggelos*, angel, sphix, sphinx: which also was precisely the mode of spelling among the ancient Romans, as we find from Priscian, and in the Tuscan, from Varro; so too among the Welsh, or earlier Britons, Ag or Agg stood for Ang, as Agel or Aggel, for Angel. The connection between the Greek and Oriental grammatical forms need not now be asserted, we presume; the Greek had little influence upon the French tongue; the Celtic portion of the Greek is not the identical, but counterpart of the Celtic portion of the Latin; and this last language scarcely acknowledges the nasality, save in its elisions in the scansion of verse, where, as though the final *m* were at will a nonentity, the vowel preceding it slides into the vowel commencing the next word, exactly as when the *m* does not intervene,—thus our fairer readers will notice,

where the *m* is twice sounded and once omitted altogether.

From the fact that the Brahmins (to whom it has pleased the learned of Europe to attribute all the civilisation of Hindostan,) having no pretensions to migration,—unless the faint tradition of silver and gold pyramids built in Egypt be a proof in their vindication;—it may be safely inferred that this nasality did not come to Europe or France direct from them, any more than from the Greeks. It is, however, as remarkable as it is unquestionable that, as we have previously shown, (No. 39, October, 1837, Art. Lassen,) the old Persian language of the arrow-head inscriptions establishes it to have existed in the time of Darius and Cyrus. The Celts, whom we trace to Persia by affinity of language, were eminently migratory; the Zend, found among a migrated Persian race, fire-worshippers, in India, strongly affects the nasal sound; and to this instance of Eastward migration we subjoin one to the West, namely, the Etruscans, whose language, says Porphyry, resembles the scream of the eagle; *i. e.* it was nasal. And regarding whom in the second title at the head of this paper it is observed that the Pelasgic idiom served to form the Greek and the ancient Italian language, the Etruscan, and that their Cyclopean labours have astonished succeeding ages.

From the foregoing it follows, we submit, that the nasal sound of the French tongue is derived through the Celts from Persia itself; and that the elision of final syllables in various words, has, though accidentally, yet necessarily made it more so.

The desinence of terminations in the French, and the consequent confusion of case, rendered necessary the perpetual use of the article, which the Latin and German disregard, and the Greek especially affects, as likewise the Arabic. To this last, we suspect, the use is due chiefly, but not entirely; for though the *l* as a liquid or vowel is interchangeable with *o*, while the Spaniards have adopted the Arabic particle *el* unquestionably, the Portuguese, widely as the Arabic language is transfused into theirs, retain the forms *o*, *a*, as masculine and feminine, exactly as the Greek. We do not hesitate, therefore, to avow our belief that in Spain, France, and why not in Italy, the introduction of the liquid is a substitute for the vowel form of the article, which, obliterated in Spain, remains untouched in the native language of that country till the 11th century, viz., the Portuguese; while the liquid and the vocalic still contest possession of the French and Italian languages: as the *du*

for masc. de *la*, fem. and *aux* plural, in the former; *il*, *gli*, *i*, in the latter tongue.

We must return to our author and Charlemagne.

"In the meanwhile (eighth century) the vernacular language, the *Roman*, continued to receive modifications, and towards the end of the TENTH CENTURY it was already divided into two dialects; that of the south of France, or *Langue d'Oc*, and that of the north, or *Langue d'Oil*; thus named from their respective modes of affirmation. The language of Italy was in the same manner distinguished by the name of *Lingua del Sì*.

"*'Il bel paese là dove 'l Sì suona,'*
says Dante."

We quote for remark some further extracts:—

"The *Langue d'Oc*, or *Provençale*, which had preserved greater analogy with the Latin, was harmonious, sonorous, and cultivated by the poets of love, the bards of the *gaie-science*, the Troubadours. The *Langue d'Oil*, *d'Oui*, or Wallon romance, spoken to the north of the Loire (the boundary of the two dialects), had departed more widely from its Italic origin, and felt more powerfully the contact of the Germans, Normans, and other barbarians. If the Troubadours were the poets who, at least in general, sang forth the feelings of the heart, the Trouvères, the rhymers of the *Langue d'Oil*, had for their portion, wit, satire, *gausserie*, and withal a great deal of naïveté. These were the qualities of the old Gaulish character; principally displayed in the *Fabliaux*, or Tales, but the warlike element of the north was likewise manifested in the *Langue d'Oil*. This heroic spirit was embodied in enormous chivalric poems, called *Chansons de Gestes* (from the Latin word *gesta*, exploits, achievements), or *Romans des douze Pairs*, because the Peers of Charlemagne were their principal heroes. It shone also in the *Romans de la Table Ronde*, the actors of which are the brave king Arthur of Wales and his knights, *Erranti che di sogni empion le carte*!*

"These remarkable poems were composed chiefly in the ELEVENTH and TWELFTH CENTURIES, when the prodigies of Gothic architecture were raised towards heaven.

"The ruin of the Provençal language was consummated by the cruel war waged by the northern lords against the unhappy Albigenes. The southern province, *Languedoc* (called so on account of the language there spoken), was filled with ruin and slaughter. These disasters covered the lyre of the Troubadour with a mourning veil, and silenced it for ever!

"The '*langue d'Oc*' is vanquished and becomes a jargon, a gibberish; the '*langue d'Oil*, *d'oui*,' is triumphant, and finally becomes the '*Langue Française*!'

"*'Habent sua fata*!'

"Another event greatly contributed to the success of the French language: William the Conqueror had carried it with his sword to England. The battle-cry of his army at Hastings was '*Notre Dame! Dieu aide! Dieu aide!*' William ordered that the French language should be the official language of business; he even commanded that in schools children should learn the French first, the Latin afterwards, provided they had time for it.

"No wonder then that some of the first literary monuments of the French language had England for their cradle.

"In the twelfth century, ROBERT WACE, the author of the *Roman du Rou*, a poem celebrating the exploits of Norman chiefs, thus begins a narrative of the battle of Hastings. He says that Taillefer, a minstrel, went before the warriors, singing warlike songs:

"*'Taillefer qui molt bien cantoit
Sur un cheval qui tost aloit
Divant eux s'en alloit cantant
De Carlemaine et de Rolant.'*

"In these antique lines the French language may be easily recognized."

The Troubadours and Troveres have been highly rated, but less perhaps from their intrinsic value than from the circumstances of the age and of their position. They certainly had a taste for nature; but in the absence of classic models, they soon learned to pervert it into the fanciful or brilliant. Poetry was with them assuredly rather the means than the end: for the spirit of the French people seems ever to have been too active and restless for the calm and contemplative enjoyment of the muse; she was with them a taste rather than a passion, an object of courtly gallantry rather than of worship. The Celtic races too retained their peculiar tendency even when they resorted to her aid. They imitated rather than originated; and theirs, the fanciful school, was formed by AN ABSOLUTE MISTAKE, of metaphorical for fanciful language. This is well worth illustrating.

We have elsewhere* noticed that the necessity of an historical poem led Ferdousi to compose his great work, the *Shah Nameh* or history of the Kings of Persia. Compelled to embody various adventures and wars into single achievements, and different historical characters into one all-accomplishing heroic personage, from the impossibility of preserving the interest of his narrative otherwise;—and even the present extent of his poem is fatal to its popularity;—compelled thus to employ figurative language and dress up history in metaphor, the allusions

* Who, wandering, fill many a leaf with dreams!—TASSO.

† See F. Q. R. No. 44, p. 214, Article *Arabs in Italy*.

which his more immediate audience might in the spirit of Eastern taste have received, comprehended, and allowed for, were by strange nations taken in their literal sense, as fanciful and fabulous, not allegorical. While the Spaniard, therefore, and the Teutonic races, the latter from their oriental origin, the former from their Arab masters and their own Gothic reminiscences perhaps, adapted their poetry to narrative ballads and the adventures and achievements of actual persons, the eager fancy of the French, like the vivid genius of Ariosto, ran at once into the channel of the imaginative and marvellous; adhering, as we have shown, to these foreign, Persian originals, but interpreting their historic allegory into romantic phrensy. The Celt in truth everywhere seems to have required the inspiration of a foreign genius in the peaceful art of poetry, and more especially in the narrative; The Earse, the Gael, the Carthaginian, were mute; as might have been the Roman, but for the influence of Greece.* Talent, sarcasm, shrewdness, brilliance, perspicuity; the graces of writing, not its majesty, were native to France; but her national genius was active not contemplative, eager rather than serious, more ardent than imaginative: its efforts at dignity were tinged with exaggeration, the impressions it produced more immediate than lasting, its powers were in the senses rather than in the soul; the triumph of effect, not the pause of emotion.

"THIRTEENTH CENTURY.

"In this age GUILLAUME DE LORRIS composed *Le Roman de la Rose*, a tedious and endless allegorical poem which enjoyed in France a great celebrity.

"It seems that the victorious 'langue d'Oui' had already acquired in Europe some reputation, for BRUNETTO LATINI, the master of Dante—the father of Italian poetry, wrote in French his *Petit Trésor* which is a sort of little encyclopædia of the learning of that time. He thus gives his reasons for having written in the French tongue: 'Et se aucun demandoit pour quoy ce livre est escript en Romans selon le parler de France, pour ce que nous sommes Ytaliens, je diroie que ce est pour deux raisons:—l'une que nous sommes en France;—l'autre pour ce que la parleure est plus délitale et plus commune à touz langages.'

"FOURTEENTH CENTURY.

"JOINVILLE, who died very old in the fourteenth century, was, both in language and style, very superior to his predecessor VILLEHARDUIN, the historian of *La Conquête de Constantinople* by the crusaders. He wrote with charming simplicity *La Vie de St. Louis*, his king and friend, whom he had ac-

companied to the Holy Land. 'Grans persécutions et miseres,' says he, 'le bon roy Saint Loys et tous nous avons souffertés et endurées outremer.'

"This age was rent by foreign and civil wars, and plunged in misery. They left neither leisure nor thought for literature.

"FIFTEENTH CENTURY.

"FROISSART, who, by the date of his death, belongs to this century, had wandered, 'en chevauchant,' on horseback, the highways and by-ways; less to meet with chivalric adventures, as the 'ingenioso hidalgo de la Mancha,' than to hunt after talkative 'anciens chevaliers, écuyers et héraults d'armes,' for he wanted to fill his romantic and animated *Chroniques de France, d'Angleterre, d'Ecosse et de Bretagne*. Froissart, who had received from Sir Walter Scott the honour of being called his master, was not only an interesting chronicler, he was also a poet, and perhaps a better one than ALAIN CHARTIER, who was, however, deemed the most talented, but also, as a drawback, the most ugly man of his time.

"Nevertheless, on a certain occasion, he received a pleasing mark of estimation. One day, when Alain Chartier had fallen asleep upon a chair in the hall of the royal palace, the beautiful Marguerite of Scotland, wife of the dauphin who afterwards reigned as Louis XI., passed by chance through the hall. Seeing Alain asleep, the princess approached gently and kissed him. As the surrounding courtiers were astonished at this 'faveur,' Marguerite immediately said: 'Je n'ai pas donné un baiser à l'homme, mais à la bouche dont sont issus tant d'excellens propos, matières graves, et paroles élégantes.'

"Notwithstanding this flattering opinion, the true poet of the fifteenth century was CHARLES, DUKE OF ORLEANS, who, taken prisoner at the battle of Agincourt, remained in England twenty-five years. The charms of poetry relieved the weariness of his exile. Thus he sang the renewal of nature—Spring:

"Le temps a laissié son manteau
De vent, de froidure et de pluye,
Et s'est vestu de broderye
De soleil luisant, cler et beau.
Il n'y a beste, ne oiseau
Qu'en son jargon ne chante ou crye:
Le temps a laissié son manteau
De vent, de froidure et de pluye."

We may pass over Philip de Commynes, Marot, "the father of letters," and Montaigne; and need merely remark of Rabelais, that his spirit seems to have fallen precisely within the category of our preceding observations. With the furious storm of the Reformation raging round him, the lively Frenchman alone could not afford to be serious, and launched only the poisoned arrows of his wit in aid of the massive clubs and battering-rams of Luther and the Reformers.

* See F. Q. R. No. 44, Art. *Italy*.

"In respect to language, Montaigne, Amyot,* the graceful translator of *Plutarch* and *Longus*, and also poor Villon, the ragamuffin Paris poet—'gamin de Paris,' may be considered as the last representatives of the old naïveté of Gaul. Ronsard, who lived in the most enthusiastic period of the revival of classic literature; Ronsard, the contemporary of the Scaligers, of Turnebus, Muretus, Cassaubon, Erasmus, wished to change the character of the French language, and render it more learned; more similar by combinations of words and inversions to the classical tongues of antiquity.

'Mais sa muse, en Francois, parlant Grec et Latin,'

his hard-labouring muse did not long find imitators. But though the attempt of Ronsard at thus violently changing the forms of the French language was without result, it must, however, be acknowledged that the prince of poets, and the poet of princes, as he was called, had talents, and was not deficient in grandeur.

"Besides, the poems of Ronsard consoled the unfortunate Mary Stuart, recalling to her heart France and her happy days!

"Who has not heard the touching lines she traced on board the vessel which was conveying her to Scotland, at the moment when the shores of France disappeared from her eyes!

" 'Adieu, plaisant pays de France!

O ma patrie

La plus chérie,

Qui as nourri ma jeune enfance!

Adieu, France! adieu, mes beaux jours!"

Upon which our author, eminently French, exclaims

* We subjoin a specimen of the French of this time from Amyot's translation of *Plutarch's* life of *Julius Cæsar*.—

"Mais la malveillance grande que luy porta Clodius, commença par telle occasion; cestuy Clodius estoit de bien noble maison, ieune d'aage, et au demeurant homme temeraire et insolent: et estant amoureux de Pompeia la femme de Cæsar, il trouua moyen d'entrer secrettement dedans la maison en habit et avec l'equipage d'une ieune garce menestriere, pource que ce iour-là les Dames Romaines faisoient en la maison de Cæsar ce sacrifice là solennel et secret, qu'il n'est pas loysible de voir aus masles, et pour ceste cause n'y auoit homme du monde sinon Clodius, qui esperoit qu'on ne le cognoistroit point, à cause qu'il estoit ieune garçon n'ayât point de barbe, et qu'il pourroit par ce moyen s'approcher de Pompeia parmy les femmes: mais estant entré la nuit dedans ceste maison grâde, dont il ne sçauoit pas les estres, il y eut vne des chambrières d'Aurelia mere de Cæsar, qui le voyant aller errât çà et là par la maison, luy demanda qui il estoit et comme il auoit nom: si fut contraint de parler, et dit qu'il cherchoit l'une des seruantes de Pompeia qui s'appelloit Abra. La chambrière cognut incontinent que ce n'estoit point la voix ny la parole d'une femme, et s'escria, et appella les autres femmes, lesquelles fermerent tresbien les portes et chercherent par tout tellement qu'elles le trouverent dedans la chambre de la seruante avec laquelle il estoit entré. Le bruit de ce scandale fut incontinent diuulgue par tout."

"Ah! there are tears in this adieu, and as it were, a vague presentiment of—Fotheringay."

We take another extract.

"SEVENTEENTH CENTURY.

"The French language in passing through the hands of Joinville, Marot, and Montaigne, became by degrees more pure, more perfect. Its infancy was followed by adolescence; and now, arrived at the seventeenth century, it had reached maturity, and Malherbe, that severe tyrant of words and syllables, is the poet from whose hands it received the robe of manhood.

"Listen how Boileau describes this memorable literary epoch:

" 'Enfin Malherbe vint, et le premier en France,
Fît sentir dans les vers une juste cadence.
Les stances, avec grace apprirent à tomber
Et le vers sur le vers n'osa plus enjamber.
Tout reconnut ses lois, et ce guide fidèle
Aux auteurs de ce temps sert encore de modèle.'

"In order to appreciate the correctness of Boileau's judgment, here are some stanzas which Malherbe addressed to Du Perrier, mourning the loss of his daughter:

" 'Mais elle était du monde, où les plus belles choses
Ont le pire destin;
Et, rose, elle a vécu ce que vivent les roses:
L'espace d'un matin.
La mort a des rigueurs à nulle autre pareilles,
On a beau la prier,
La cruelle qu'elle est se bouche les oreilles,
Et nous laisse crier.
Le pauvre en sa cabane, où le chaume le couvre,
Est sujet à ses lois;
Et la garde, qui veille aux barrières du Louvre
N'en défend pas nos rois.'*

But the world had lain so long in an intellectual darkness, the dogmas of the schoolmen had imposed so severe a restraint upon the commonest efforts of the mind, and had chained reason so closely to the chariot-wheels of an assuming and dictatorial emptiness, which at every subtle turn prostrated and crushed the independent, substantive form of thought, that humanity could bear it no longer. It has often been remarked that there are at times absolute crises in the human spirit, when various individuals gifted with equal, though perhaps essentially differing powers, come forward with rival energies to throw off from themselves and the world, the yoke of an unsparing and blinded

* But she was of the world, where the loveliest things meet the severest destiny; and as a rose, she has lived the time that roses live—a morning.

Death has rigours exceeding every other: it is in vain to beseech him. Cruel as he is, he shuts his ears and lets us cry on.

The poor in his thatch-covered hut is subject to his laws, and the guard at the palace-gate of the Louvre cannot keep him from our kings.

tyranny. It is undoubtedly true that the social, like the moral and the physical body, is apt to stagnate in its humours by observing an undeviating course; and that an effort of nature follows to get rid of the humours, attended, however, according to circumstances, with various success. The weight of a moveless despotism over the faculties of the mind, bearing down or preventing every exercise of its powers, and this too, when activity is the very condition of its existence, at last becomes irksome and intolerable.—The efforts against this state of things are, and have probably always been, far more frequent than is generally supposed: but the want of eventual success to these efforts, and their restriction within the narrow circle of the mover's own immediate sphere, has perhaps frequently arisen from a want that we do not remember ever to have seen defined. It is not the want of motive power in the originator, so much as the absence of a weaker but more subtle assistant, who, if incapable of the original vigour and masculine energy of the motor, yet possesses the useful capacity of a recipient, a feminine principle of absorbing and fostering the first germ, and bringing it forth in an advanced stage of effectiveness and strength. The masculine energies of Luther found such condiscipulation and sympathy in the less vigorous, but more winning labours of Melancthon, Calvin, &c.; and eminent as were these last named men, their existence might possibly have been even unknown, had they not been called into the full exercise of their extraordinary faculties by a mind more extraordinary, at least in vigour, than their own. It is these adapted combinations, if we may use the term, that form the crises; the genius of the leader fills up the chasms of intellect, and inferior energies that assume the various parts appear almost in rival effectiveness, because each portion is combined by the leader's genius into one united effort; and the deficiency of the separate instruments is relieved by the mighty bass, that actuates and harmonizes the whole.

“Malherbe, the severe, and perhaps the too severe reformer of French literature, died two years after the English reformer of science, the author of the *Novum Organum*, the great Bacon; about the same time as DESCARTES, whose starting point was his *Discours sur la Méthode pour bien conduire sa raison et chercher la vérité dans la science*. Descartes was the author in France of a scientific revolution analogous to that of the illustrious chancellor of Elizabeth. It may be said that both of them dethroned the ‘ipse dixit’ of the scholastics, and introduced as well in metaphysics as in natural philosophy the principle that Luther had already en-

forced in theology—the great principle of free examination.

“In the chronological, as in the analogical order, there now appears another amazing genius, BLAISE PASCAL, who, yet a child, dived deeply into mathematics by the strength of his own unaided thought; who discovered the weight of the air; and gave in the *Lettres Provinciales*, written against the Jesuits, the model of the most spirited French prose and the most triumphant logic. He was scarcely thirty-one, when one day his carriage having been nearly overturned into the Seine near the bridge of Neuilly, the great thinker considered this event as a warning from God, and from that time he always fancied himself on the brink of a precipice. He soon after died. On being opened the stomach and the liver were found dried, and the brains were almost of a solid consistence.

“‘Qu’est—ce que l’homme dans la nature?’ asks Pascal in his *Pensées*. ‘Un néant à l’égard de l’infini.’ What a train of meditation is opened by the following reflection: Man is only a reed, the weakest in nature, but it is a reed that thinks! L’homme n’est qu’un roseau, le plus faible de la nature; mais c’est un roseau pensant. Il ne faut pas que l’univers entier s’arme pour l’écraser. Une vapeur, une goutte d’eau suffit pour le tuer. Mais quand l’univers l’écraserait, l’homme serait encore plus noble que ce qui le tue, parcequ’il sait qu’il meurt; et l’avantage que l’univers a sur lui, l’univers n’en sait rien. Ainsi toute notre dignité consiste dans la pensée. C’est de là qu’il faut nous relever, non de l’espace et de la durée.”

We need not dwell longer upon the romantic turn of French literature to the days of the Scuderi, and which our author has passed unnoticed; the sources of real feeling and poetry had been opened by Shakspeare, Calderon, and Camoens; and the Knight of La Mancha had achieved a task to which his wildest aspirations had never aspired, by singly vanquishing and driving from the field the Amadis and Palmerins, and all the other flowers of chivalry.

We cannot pass by Molière, at once the Terence and Shakspeare of France; and add an anecdote of him, to give a specimen of M. Albites’ taste.

“Six years had elapsed since Shakspeare and Cervantes, kings of the drama and romance, had departed, when in Paris, in a house on the Rue St. Honoré, near la Halle, was born their brother genius, the immortal MOLIERE. It was in 1622. Since the Mysteries, the Moralities, the Sotties, strange dramas of the middle ages, had ceased to be performed, France had had nothing remarkable on the stage. In the seventeenth century Molière came, and presented his country with true comedy; Corneille had already bestowed on it tragedy. Like Shakspeare, Molière was both an actor and an author.

His first important step in the career was the comedy of the *Précieuses Ridicules*, in which, according to the precept of Horace, 'Castigat ridendo mores.' This aim he attained; for the mania of affected wit, which at that time infected the society of Paris, disappeared under Molière's lash. *L'Ecole des Maris* showed, in the education of women, the superiority of reason and mildness over severity and ignorance. In the *Mariage Forcé* Molière exposes old Sganarelle who marries a woman greatly younger than himself. Who could believe that, two years before, the author himself had fallen into a similar error! At the age of forty he had married the young Madlle. Amande, who was scarcely sixteen! Yet if she had but appreciated her elevated position!—the wife of such a great man! But, no, far from it, she rendered him very unhappy. Yet he never could cease to love her."

"One day Chapelle, a school-fellow, arrived at Auteuil with some *bons-vivans*. 'We are coming to dine with you!' cried Chapelle, as soon as he perceived him. 'You are welcome,' said Molière. He had a good dinner prepared, and prayed Chapelle to do the honours of his house, for, as to himself, feeling unwell, he retired after having merely taken a cup of milk. The beginning of the dinner was only merry; but during the dessert the libations (not of milk) succeeded each other in great number, and soon the reason of the guests began 'à battre la campagne.' At first it was a tumultuous medley of follies; but one grave word having by chance found its way there, the jolly fellows seized upon it, and behold! the conversation takes a serious strain. 'Life! what is life! what a sad thing is life! Away with life!' 'Gentlemen, a luminous idea strikes me,' cried one of the guests, 'we all agree that life is a stupid thing; why do we not rid ourselves of it! What if we were to go to the river and drown ourselves! Would it not be wonderfully glorious?'

"'Bravo! bravo! approved!' exclaimed all, 'let us go and drown ourselves!' They tumultuously vacate the dining-room and hasten to the river. The noise attracted a few inhabitants of the village; they made an attempt to prevent them from executing their project; the champagne drinkers become furious; they draw their swords and begin to pursue, but not with the firmest steps, their good-hearted would-be deliverers, who fly and take refuge in Molière's house. The tremendous noise awakes him; he gets up. Chapelle and his companions arrive, incensed with fury, and crying—'Villains, rascals, scamps, impertinents!—to prevent gentlemen from drowning themselves!' Molière, who perceives that the wine is still acting on them with all its strength, severely scolds the peasants and orders them to retire. Then addressing his guests—'You want to drown yourselves, gentlemen: egad! you are right: it is a very good idea. I have, however, greatly to complain of you—I thought we were better friends. What! you

nobly resolve to give up the game, and you go away without me! Ah! it is very wrong!'

"'He is right,' vociferated our drunkards; 'but let us repair our fault; let us go, Molière, and drown ourselves together.'

"'Certainly, let us be off;' said Molière, 'to the river!'

"But suddenly stopping;—'My friends, a reflection strikes me; is this a suitable hour for so fine and glorious an action? To-morrow, in Paris, they would say that we have chosen night from motives of timidity: they would perhaps say that it was a resolution of people who had just left the table. Will it not be much better, in order to have all the fame we deserve, to drown ourselves to-morrow morning in sober earnest, and in broad daylight? Our glory will then be immortal!'

"'Why, he is right!—he is always right, ce diable de Molière!'

"'Now, my comrades, go to bed; to-morrow the great feat.'

"'Yes, to-morrow.' 'To-morrow.'

"Next morning, at ten o'clock, the breakfast bell was heard. The boon companions were awakened from a very sound sleep. The fumes of the wine had subsided, and they felt themselves more disposed to eat a hearty breakfast than to take their last bath in the Seine.

Of Corneille and Racine we need say little; the immense difference on principle between the English and French stage, arising in great measure obviously from the causes we have pointed out in a preceding part of this article, preclude us from the task of appreciating genius so foreign to our own country and habits. With every admiration of their undoubted powers, we cannot help imagining that their object was rather a school than an audience; to edify and astonish more than associate with; to grace, ennoble, and elevate rather than sway; to regulate and form, more than to move. Their works seem poems rather than plays; imaginative more than impassioned; a painting in fresco preferred to reality. The very Claudes of poetry, where Nature must be dressed by Art. They have, to our judgment, more eye to display than to feeling, more tendency to declamation and sentiment than the truth of genuine impulses can afford to waste on them: they are, however, magnificent exteriors. The fault lies with the genus and not with the author perhaps; his genius is evident and great, but unfortunately his art is still more evident and greater. The comparison of the English and French stage bears some analogy to that between Greek and Roman genius.

We have passed over several names for that of Montesquieu; our object being to give, where it is practicable, novel views on a subject so familiar as French literature to our readers.

"The first strong attack against the manners, the institutions, the establishments of France and Europe in general, is that of the *Lettres Persanes* of Montesquieu. The plan of these letters is of the same nature as Goldsmith's *Citizen of the World*. In spite of the success the *Lettres Persanes* met with, Montesquieu did not continue in the same career. A member of a family belonging to the magistracy, himself a president in the "Parlement de Bordeaux," he abandoned light literature to dedicate himself to the grave studies of law. He took such interest in laws, principally in their relation to history, that in order to have leisure for the production of some future work, he left his presidency and retired to his estate of 'La Brède.' Other motives also induced him to withdraw from the 'Parlement' (court of justice). He did not possess all the dispositions necessary for a tribunal; he was deficient in readiness of mind. He could do nothing without meditation. 'Cette continuelle présence d'esprit,' says M. Walckenaer, 'ce jugement prompt et facile, cette patience attentive qui suit dans tous ses détails les détours de l'intérêt privé; cette facilité d'élocution qui fait ressentir aux yeux des autres la vérité et la justice qu'on n'a qu'un instant pour discerner, qu'un instant pour faire triompher; toutes ces qualités indispensables dans un juge manquaient entièrement en Montesquieu.'

"He travelled through Italy, Switzerland and Holland. At the Hague he met Lord Chesterfield who offered him a place in his yacht to cross over to England. Here the Royal Society elected him one of their members. He professed to conform himself to the disposition of every nation. 'Quand je suis en France,' said he, 'je fais amitié à tout le monde; en Angleterre je n'en fais à personne; en Italie je fais des compliments à tout le monde; en Allemagne je bois avec tout le monde.'

"Montesquieu returned to *La Brède*, and published his *Considérations sur les causes de la grandeur et de la décadence des Romains*, written with the pen of a Tacitus. Fourteen years afterwards appeared his *Esprit des Loix*, an extraordinary monument of reason, erudition, and terseness of style; in which he endeavours to show what has been the essence, the spirit of laws public and private, among all nations, and at every period.

"A part is dedicated to the analysis of the constitution of England, of which he shows himself a great admirer. The work begins with this broad definition of laws:—'Les lois, dans leur signification la plus étendue, sont les rapports nécessaires qui dérivent de la nature des choses, et dans ce sens tous les êtres ont leurs lois: La Divinité a ses lois, les intelligences supérieures à l'homme ont leurs lois, les bêtes ont leurs lois, l'homme a ses lois.'

The President has been almost as unjustly decried of late as he was overpraised formerly: but with all his defects he was the

first in France to apply popularly, to the study of Ancient History, the spirit of original thinking engendered by Montaigne.

We quote the passage respecting Buffon—

"Buffon, a great naturalist and a great writer, kept apart still more than Montesquieu from the passions of the times, and devoted all his life to the composition of his beautiful *Histoire Naturelle*, of which on account of its elaborate though beautiful style, Voltaire chose to say, '*Pas si naturelle*.' Buffon died before it was completed, but he has had worthy continuators in Cuvier and Lacépède. It is Buffon who, having deeply meditated on the art of writing, uttered this truth: 'Le style est l'homme.'

We may add here an anecdote related by Grimm, and characteristic of this eloquent writer.

In the decline of his life a friend calling upon him, asked how he employed his time. "In correcting my works," he answered, "and improving the style in some parts. The greater part cannot be improved."

Our space warns us to conclude; and we take but one extract more; it is of Napoleon, of whom it was said by Fox that he would have been, or was, a greater poet than Homer!

"Napoleon Buonaparte, General, Consul—Emperor, re-established order. The muses began to show themselves, but the great captain, *membre de l'Institut*, mistrusted them; he allowed them words, but he did not like them to think. After having received from this master of military eloquence, from the new Charlemagne, that which the past devastation rendered so necessary—Laws and laurels, order and glory,—France thirsted for peace, and also for moderate liberty. This the great soldier refused. Napoleon performed only half the necessary task; he knew how to give order; liberty he willed not. He fell.

"Since that period France, in the midst of many vicissitudes, has progressed at last in her desired career. Literature, of course, has felt the influence of this direction. All the great questions which agitate the human mind have again been studied, and continue to be meditated: God, Religion, Morality; theories of Psychology, Metaphysics, Æsthetics; in one word Philosophy;—the Physical world, Political economy, Constitution of Property, Association, Legislation, Government;—none of these high subjects have been neglected. In an æsthetic point of view, French Literature was divided at first into two camps: one was that of the great champions of certain Aristotelian rules which are nowhere mentioned by Aristotle; who were at the same time great partisans of the literary forms of the age of Louis XIV., and were called *Classiques*: the other was the camp of the innovators, or partisans of the free forms which they saw generally adopted in foreign literature, and were called *Romantiques*. But now the liberal minded of the two parties are no longer adversaries; they have agreed to admire and love the good and the

beautiful wherever it may present itself, either in Racine, in Dante, Shakspeare, Schiller, or Calde-ron.

"Some persons, only partially acquainted with the actual state of Literature in France, have imbibed unfavourable prejudices. Their dislike is generally derived from having perceived that some French modern novels have an injurious tendency. But what literature, what period, is entirely pure, entirely exempt from bad or tedious books? Is it just to condemn all for the faults of a few?"

We give the author of these very slight sketches the full benefit of this very slight defence.

In thus lightly touching upon some peculiarities of the French language and literature, while reserving more detailed examination of both for a future occasion, we cannot help avowing a suspicion that the early grace and brilliance of the Troubadours and Troveres, refining upon Latin taste and concision alone, and uninterfused with any admixture of Greek vigour and amplitude, or of Eastern exaggeration of thought and feeling, produced the worst effects upon French genius in after times, by narrowing its basis and inculcating a severity of thought and chasteness of style in poetry that leads too nearly to emasculation. The Latins had refined upon the Greeks; the French refined upon the Latins; their poetry therefore has been in great measure that of the successors of Virgil; imitation of imitation, severed by one remove the more from Homer and from Nature. The error of Malherbe and others was, that in striving to perpetuate precision they forgot intensity; forgot that completeness to the ear is not by any means capaciousness to the mind, and that in guarding against inaccuracy of thought and slovenliness of language by exactitude and definiteness, they were risking the substitution of polish for nature, effect for emotion; and of closing at least one avenue of the sublime.

The thought and its expression are too closely connected to allow of two dissimilar processes for these two components of poetry; the ocean of human feelings cannot be smooth at the surface while passion is heaving the depths below: the labour of the former perfected, the poet must stop in his nobler impulse to polish and smoothe over his sensations: the sister-art of the chisel has divided a similar labour; or else in this and in all such cases the effect has been, that the obvious and external has outweighed the power within, and the artist of sublimity has sunk into the dancing-master.

Poetry as an art can never, in truth, bear any rules but those which nature herself

suggests to the poet. There are abundance of rhymesters undoubtedly who mistake their phantasies for her dictates, but passing by these Ixions, the real poet is as timid of others as he is confident in himself. If then he finds "a pre-established harmony" in force against him from the outset, he will either conform to it by curtailing his own spirit, give up the task in despair, or rush from mere terror into desperation; and the failure consequent on this last will deter farther attempt.

France had no proper ballad literature: her poets sung to the Court, not to the People, and their labours consequently partook of courtly affectation, not of popular truth. French poetry existed in its artificial state at home; it was rejected, or modified, so soon as it got abroad.

The Reformation, too, that forced a popular element into the social system of Europe, was rejected in France, and finally driven out by the Edict of Nantes. It fell on barren ground, sprang up, and soon withered away there, while in Germany and England it produced a hundred-fold, by crushing the remains of feudal tyranny and eradicating its very impressions from the mind. In Elizabeth's reign chivalry and its niceties was a taste, and of the court alone, not an idol of the nation; and the final influence of the cavaliers sunk in the great rebellion. Dryden, if a follower of the French, could not be called French, for he delighted to sleep on the precipices of obscurity and to dwell in the realms where light and darkness mingle. The admirers of Pope himself were astounded by the vigour of Johnson, and Goldsmith's simplicity produced a more lasting effect than the sweet artifice of Collins. The French school in England thus existed but for a day.

To Germany its effect was more injurious, as it was also more lasting there; patronized as it was by the Great Frederic especially: but the vigour of German genius threw off the yoke at length.

In France itself the cause of the artificial received its death-blow at the Revolution, though in this, its native seat, it has long staggered in convulsive energies and monstrous imaginations, the reaction of oppressed nature, the certain presage of approximate dissolution. The universality of "the Mar-seillaise" was the first diagnostic, and Beranger has completed the work of that prototype Hymn. We cannot enter upon the great names of living France at this stage of our article, but reserve the consideration for a better opportunity.

ART. V.—*Ludwig Tieck's Gesammelte Novellen. Vermehrt und verbessert. Acht Bande.* (The Collected Tales of Ludwig Tieck. Enlarged and Improved. 8 vols.) Breslau. 1838.

WE have lately combated in this journal, and not, we hope, altogether without success, the pretensions of the Germans to be regarded as models of taste and the leaders of literature in general. The success of these pretensions has been not in proportion to their justice, but to the cool assumption and self-complacency with which they were broached at home, and to the mystery and ambiguous reserve of their supporters abroad. Where men are disposed to praise, and ambitious, in praising, of displaying their own discernment, nothing favours their object so much as meeting with authors who are at once vague and heavy, dull and ostentatious; who furnish an indefinite outline which they can fill up at choice, or matter which they can safely interpret as they please, so obscure is its purport, and so few the competitors in the task of expounding studied no-meaning.

We are ready fully to acknowledge the valuable services which the Germans have rendered, and are rendering, to science; and we cannot but recognize in their literature an exuberant vitality which manifests itself in the most diversified, if not always the most healthy forms; but we must maintain that in no other country are the tares so thickly sown with the wheat, and that in none other is such caution necessary to avoid being bewildered by lights which blaze only to betray.

The Germans, too generally enveloped in clouds of speculation, are favourites with some, precisely because their writings frequently admit no end to inquiry. To those who delight to vacillate between given points—to shrink from conviction into doubt—to divest themselves of what they term individual, subjective, one-sided considerations, to view everything with abstract impartiality, but to decide in favour of nothing; to those who recognize with enthusiasm the claims of Power to our admiration, in whatever garb it may bestride the world, whatever path it may have chosen, and whether or not it have Right on its side; and who are fain to leave the pursuit of Truth out of the question, as something interesting perhaps, for certain local and personal reasons, to the animal called man, but as something merely subjective and therefore unworthy of true philosophy;* to these inquirers for inquiry's sake,

and travellers for the love of travel, the writers we allude to must be welcome companions, for they are on a voyage without a compass and wafting they know not whither. But to the English reader of the old school their way of touching everywhere and arriving nowhere, will scarcely prove attractive in the main, however agreeable and careless may be the life it promises. Even the Englishman of the present day, divested of national prejudices, untrammelled by home-spun politics and Scotch philosophy, and who cannot see without pain the unspiritual tendencies of his countrymen and the deficiency existing in the modern philosophical literature of his native country, will scarcely on that account be the more disposed to cry up the Germans, whose transcendentalism but helps them to shuffle off all fixed and binding principles, and whose whole philosophy indeed only serves to amuse idleness, and paralyze action. It is not, perhaps, asserting too much to state, that an immense number of educated Germans have neither a national character, a definite religious creed, nor any fixed political principles; their vanity is flattered if they can succeed in passing for foreigners, and their philosophy teaches them how to give to their religion and politics any shape which the exigencies of the time seem to require.

The "*Novellen*" of Tieck, of which eight volumes are now lying before us, furnish a striking proof of the facility with which the public mind in Germany is led astray, and of the numerous false directions in which it has wandered within the last fifteen years. Most, if not all of these works, are written to correct some erroneous tendency of the time, to exhibit some popular fallacy in its true colours, to show as in a mirror their folly to the gaping multitude, and thus warn them back to reason.

They throw also much valuable light on the radical defects of the German character, as well as on the nature of the absurdities in which our Trans-Rhenane cousins have of late years indulged. The reader, however, must not imagine that they are of merely local or temporary interest. They are lessons which men of all nations may read with profit, and which, until the utilitarians have perfectionized mankind, sent folly on her travels through the spheres, and left the dull world not a solitary absurdity on which to exercise its risible muscles, will never cease to be valuable. The Germans, though successful cultivators of nonsense, are not the sole lovers of that delightful weed: we ourselves have many dilettanti who tend it with the greatest care, and who have brought it to the greatest perfection, considering the cold-

* "Philosophy," said Hegel, "is utterly useless and fruitless—and for this very reason it is the sublimest of all pursuits, the most deserving of our attention, and the most worthy of our zeal."

ness of the climate, and the hard, ungenial nature of the soil. Tieck's Novelle—*die Wundersüchtigen* (the Marvel-Lovers or Marvel-Mongers), in which he shows up in their true colours magnetism and modern magic in general, and an account of which we intend to lay before our readers in the present article, will not just now be found very foreign either in matter or bearing to our own wants.

We would here observe that the tales of Tieck may still further be recommended to the English reader for the simplicity, purity, and beauty of their style, and for their uniformly unobjectionable character and tendency. Whether the author's object be to depict Catholic bigotry, as in his masterly story, '*Der Hexen-Sabbath*;' or puritanical hypocrisy, as in that sweet and simple tale, *Die Verlobung*; or wild passions and the workings of fanaticism, as in *Des Dichters Leben (Erster Theil)*, and in *Der Aufruhr in den Cevennen*; or venial eccentricities and the comicalities of German provincial life, as in the exquisite Novelle, *Der Jahrmakkt*; he is always easy and natural, and never shows the slightest disposition to recur to the meretricious colouring of late years in such great demand amongst German novel-writers, as with the notorious wallowers in that fetid slough yclept the French romantic school. His principal defect indeed is, not straining after excitement, but too studiously avoiding it. Some of his tales principally consist of conversations and, though admirably penned, do not furnish the kind of matter which the English reader is accustomed to seek in works of fiction. Tieck should in fact always be read in a contemplative mood: he will certainly disappoint those who take up a story for mere temporary amusement, and remain passive in expectation of startling incidents, or a romantic denouement: his works on the contrary are sources of instruction, not directly conveyed, but to be extracted by mental exertion on the part of the reader himself.

The story of the "*Wundersüchtigen*," to which we propose principally to direct attention, is as follows.

In a small German town lived a gentleman called Seebach, who had, been in youth an active freemason, at a time when secret associations existed, the members of which gave themselves out for *illuminati*, and boasted the possession of supernatural powers. When the story commences, Seebach, a married man, with a grown-up son and daughter, has long withdrawn from any connection with these associations, but he still retains a lingering affection for their pursuits, and a tendency to credulity which requires

little encouragement to show itself with considerable force. Being involved in a law-suit in which no less than 20,000 dollars are at stake, he has occasion to turn over his papers in search of a document of essential importance to the success of his claims. This document he can nowhere find; but his eye is everywhere met by records of his former credulity in the shape of mysterious calculations, the work of his own deluded brains, or of pompous communications from foreign lodges. Whilst ransacking the drawers of his cabinet, in the presence of his son and father-in-law, a sheet of paper comes to light, the contents of which are so strange as instantly to attract the attention of all. In the centre of the sheet is a star from which lines radiate in all directions. Most of these lines are found to be texts or prayers, or else strange names of spirits, written in a very minute hand; and they all intersect, but in various ways, one and the same word, *Abracadabra*, which is sometimes written forwards and sometimes backwards, and in some places accompanied by stars, hieroglyphics, and other strange figures. In the centre stands the word *Adonai*, and opposite to it the name *Jehovah*, written in Latin and also in Hebrew characters. The back of the sheet bears a remark to the effect that this is a sacred amulet, of manifold efficacy in war, in cases of illness and against evil spirits; and absolutely indispensable to any person wishing to possess the power of summoning spirits of any kind.

About this time animal magnetism, magic, and other similar topics had engaged the attention of the public afresh, in consequence of the recent appearance of some new performers in these departments; and accordingly our trio regarded this wonderful amulet with interest as well as curiosity. The document of which they were in search, however, they could nowhere find, and Herr Seebach began shortly, almost in spite of himself, to wonder whether the magnetists could be of service in discovering it. A few days afterwards there arrived in the town a very mysterious adventurer, one Sangerheim, who made the acquaintance of the Seebach family, and on hearing of the loss of the above document, promised to find it. The knowledge which he manifests of their affairs astonishes all, fills them with strange presentiments, and prepossesses them in his favour; with the exception however of the daughter, Clara, who from the first shows a decided dislike to the whole proceedings; and the more so because her lover Schmalting, instead of being an affectionate and attentive companion as formerly, now comparatively neglects her

to attach himself to masonic and magnetical studies. Sangerheim inquires of Seebach whether besides the house he lives in, he is not the owner of another empty one somewhere in the outskirts of the town: on being answered in the affirmative he requests to be conducted thither, stating that there alone can he obtain the information necessary for the recovery of the document. To this house accordingly the father and son accompany him, and remain at his request in an ante-room, whilst he proceeds to an inner apartment. They listen, and in a short time hear a confused noise, as of the clashing of weapons or blows on the tapestry: then voices as of persons in angry dispute reach their ears: a distinct "No! No! It cannot be!" are given, as answers to various questions of the magician. All this is at length interrupted by a loud noise like the report of a pistol; alarmed at which Seebach and his son rush to the room where the magnetist is operating, and find him in a great heat and violently excited. He seizes the hands of both as they enter, and exclaims—"Give me till this evening and you shall have a certain answer. I am still strenuously opposed; the adverse powers refuse to yield; but this will no longer be the case when I have performed another operation at my own residence." The father and son take leave of him with minds altogether puzzled and perturbed by the scene; and in the evening their bewilderment reaches its height, for a note arrives in which the operator informs them that the document is contained in a certain drawer, in a cupboard in the old house, where the father at once recollects that he placed it many years before.

Whilst the males of the family are perplexed by this affair and can think of nothing else, but feel in consequence more or less forcibly attracted towards magnetical and supernatural pursuits, Clara strongly expresses her instinctive repugnance to the whole. It is out of her mouth that Tieck condemns that passion for the marvellous, which so often banishes quiet from the breast and ruins the brightest intellect. The voice of nature and simplicity is raised, and its lowest tones suffice to silence the loud and impudent pretensions of mystery and magic.

When her father and brother leave the house to follow the directions of Sangerheim, Clara, weeping bitterly, throws herself into her mother's arms.

"You will perhaps blame me," she says, "for seeing nothing but what is childish and absurd in these strange proceedings which have so excited us all. I cannot tolerate them; and I can find no other words to ap-

ply to them. If these things are true (and they happen before our eyes, we cannot deny them), why then life itself is a burden to me. All security seems lost; I have no longer any pleasure in thinking or acting, for to me the charm of existence was that everything took place simply and unconsciously, and that all thoughts and feelings existed for themselves. Now it seems all things are mysteriously connected, and stand in some secret relation to each other. This juggling with ghosts is to me insufferable. Can anything be imagined more directly opposed to the really spiritual than a ghost? All this commotion has so agitated me, that I would rather be delirious from fever at once, than hear these things talked about—much less have to witness them." "Console and compose yourself, my child," said the anxious mother, "you speak already as if you were feverish. I think I understand you, but your expressions seem to me too violent. All which you so despise, constitutes for many intelligent men the great attraction of life. What would many excellent people give if they could be convinced of the marvels which now take place around us, which we never looked for, but which were, so to say, forced upon us!"

"This is precisely what pains me," said Clara; "I can imagine nothing more waste and desolate than the hearts and minds of men who wish for these things, and can hunt after them. A cheerful look from the dear innocent eyes of a child; its castles of cards which it builds with so much trouble, and demolishes with a laugh;—the business of the house; baking, knitting and sewing; the day-labourer who supports his family by the sweat of his brow;—yes, anything out of our daily life you may name, even its meanest objects, are more noble and dignified than these novelties which make such imposing pretensions. Would that the twenty thousand dollars had been lost, if they could not be recovered without bringing all this mischief into the house!" "I cannot quite agree with you," said her mother; "I know no more than you what to think of the matter; but at any rate we must be grateful to the man who has made us so much richer than we were." "Never," answered Clara, "if I can help it. I have been accustomed to smile at our clergyman, in whose ideas of Christianity, the evil spirit always plays the most prominent and essential part, but I now begin to be of his opinion. Satan only is the father of these arts, and they who learn them, sell themselves to him. He is plagued sometimes by "ennui," and then knows no better pastime than by some false show to make men stupid and ridiculous. This must be the case. These detestable conjurers think they can master him, but he plays with them, like a cat with a mouse, and at last they see with horror that they have been caught from the first in his toils, and have made themselves his, body and soul.—My unfortunate Schmalzing! He is a little gold-fish that those cruel conjurers are angling for with their iron hooks, and finely will they enjoy

his sufferings when they have caught him. What a strange and hard fate, that I should have a passion for this man, whom I now, strictly speaking, can hardly esteem. I love him, and have given him my whole heart; that I feel;—I cannot be happy without him;—and yet there is so much in him which I cannot reconcile with myself. You will see, this vampire, this Sangerheim will make my darling, my chosen one, quite, quite crazy. I cannot but laugh in spite of myself. Forgive me, dear mother.' She burst into a loud fit of laughter, and then cried all the more bitterly."

After the recovery of the document, Herr Seebach felt all his youthful love of mysticism revive, and attached himself closely to Sangerheim, who made him many pompous promises of initiation into marvellous secrets. His son Anthony, however, was not quite so far gone; he felt that the new science, whether true or false, was not likely to contribute to the happiness of the family; and so, though half a convert himself, he determined to oppose its progress. He was the rather disposed to take this side of the question from his natural cheerfulness, which rendered him averse to the contemplation of marvels, some of them of very serious if not appalling character. His sister's situation strongly interested the youth, and the first effort he resolved on was to endeavour to recall Schmaling, who was magic-mad, to sober reason. For this purpose he could imagine no better plan than to prevail upon an individual of the name of Anderson, a man of great tact and talent, to personate a magician, bamboozle Schmaling by some miraculous manœuvres, and then show him how easily and grossly he had been deceived. Anderson promised to undertake this; and it was agreed that the scheme should be executed at the house of Professor Ferner, a friend of the Seebach family. The pseudo-magician had lately arrived in the town, and had made many friends from his insinuating manners, and from the facility with which he adapted himself to his company. He seemed formed to win all who knew him, so pliant was his mood, so versatile his character, so expert was he in drawing out those with whom he conversed to the best advantage. He was the soul of society, but rather from inspiring others than from figuring prominently himself. Every one in his presence felt wiser and wittier than he had ever known or shown himself on other occasions. The pseudo-magician's exterior was not very prepossessing; he was small, strongly built, with a thick neck, broad shoulders, and a head pressed down between them. Such was the man who was to bring Schmaling

at once to his senses, and to the feet of his mistress.

On an evening previously agreed upon, Schmaling, who had never seen the co-operator, was invited to meet him at Professor Ferner's: Anderson arrived, and was announced as the Count Feliciano, a name well calculated to inspire the novice with awe, for it was that of an individual who, in the capital of the neighbouring state, had lately caused the greatest sensation by his magical exploits. The scene which ensued, we give in our author's words.

"Schmaling entered the room earlier than he was expected, trembling with eagerness. The pseudo-Feliciano saluted him coldly, and assumed towards him and also towards the Professor and Anthony a dignified and condescending demeanour. But little was said at first, and the party sat down to an excellent supper, where the wine circulated very freely. It was some time before the conversation became lively; Schmaling was silent from awe; Anthony and the Professor knew not what part they should play; and Anderson appeared to aim at embarrassing them. At last in order to banish this constraint, he began to speak of his travels, and the Professor was astonished to hear the confident tone in which he described distant countries, and the correctness of his criticisms on works of art. He spoke of Egypt, the deserts of Arabia, Palestine, Syria and Persia, like one who had spent his life in visiting them. Schmaling at length became more confident, and ventured to lead the conversation into a channel which might satisfy his ardent curiosity. He was agreeably surprised to find the magician freely communicative on his favourite science, and that he did not deny the marvellous cures attributed to him;—hinting even that the philosopher's stone was no fiction, that many had possessed it, and that many still lived who were acquainted with it. 'You hold then,' said Schmaling modestly, 'the singular story of Flamel for truth?' 'Certainly,' answered Feliciano, 'for I was acquainted with the good man in India, a hundred years before Paul Lucas heard of him.' Anthony was not a little startled at this assertion, which appeared to him calculated to damage the speaker's credit, but Schmaling was already in such ecstasies that it only increased his enthusiasm. 'It is singular,' said Feliciano, 'at least it seems so to us initiated, whose life is not as chaff before the wind, that men should call things strange and inconceivable, than which properly considered nothing is more simple and natural. Was man then originally created in order, like a butterfly, to drink dew from a flower, and then like it to perish the next instant? Does not the Scripture say the contrary? And if the wisdom and knowledge of the patriarchs and other saints, carefully preserved from generation to generation, is communicated to the man chosen to hand it

down to posterity, why should we call it inconceivable or even strange? Our first forefathers lived for centuries; and he who is not unworthy of them, may even now equal their longevity. We have also perhaps this advantage over them, that we can combine the science and arts of modern times with those of ancient days, which have been lost for the mass of mankind. Thus I may say to you, and you will I hope wonder at it no longer, that I have seen and known many of the great men of past times. It was granted me to be a friend of the great and noble Dante. Many national commotions, many historical revolutions have I witnessed, and whenever my mind was disturbed by these mundane transactions I withdrew into the deserts of Egypt and Arabia, or betook myself to my favourite plains by the Ganges, where I passed my days again by the side of Flamel and several other adepts. I have remarked that during the three last centuries our art has fallen very low, for it is as long as that since our circle welcomed a new comer.'

"Here Schmaling timidly asked, whether it was possible to join these holy men, who might almost be called immortals. 'Can we hope' said he, 'that these lofty spirits will not reject a disciple, who must always be unworthy in their sight?' 'All depends,' answered Feliciano, 'on the path which the disciple takes, whether it is the right, and whether his teachers perhaps may not have rendered him incapable of initiation.' 'And how is the true to be distinguished from the false?' said Schmaling. 'In many ways,' replied the magician; 'I myself may safely say at once, that I can impart to you the best and most certain information. But in the meantime, is there a child in the house?' said he, turning to the Professor. 'I have two boys,' answered the latter, in the greatest embarrassment; for all this had not been previously agreed upon, and Herr Ferner could not comprehend what it was to lead to. 'How old are they?' said Feliciano. 'One twelve, the other only nine.' 'Then let me have the younger one here,' said the other; 'and do not let the servants disturb us.' Ferner left the room embarrassed, and not knowing what to think. He came back in a few minutes with a laughing fair-haired boy, with large, clear, and sparkling eyes. The magician called the child to him, gazed on him earnestly, told him to show his hands, placed his own palms on his head, and then in a few seconds asked in a solemn tone whether he felt anything. 'Ah!' said the boy, 'I feel so well, so calm,—as if I should like to sing; I feel as light as if I could fly; my eyes seem as if they could see through the walls.' 'Keep still, my son,' said Feliciano, with the greatest solemnity, 'and as there is nothing else here for the purpose, look attentively at the clear surface of the water in this bowl, and tell me what thou seest.' Anthony and the Professor were in the greatest as-

tonishment; they had not the slightest idea what was to be the result of these manœuvres which they had never anticipated. Schmaling was lost in admiration. The greatest silence prevailed. 'I see,' said the child, 'a young gentleman, a handsome young gentleman, tall and thin and nicely dressed: it seems to me as if I knew him. I believe it is the gentleman here in the room. But he stands in a strange room, where I never was. Now another gentleman comes: he too is not old; but rather stouter. They are speaking together. All sorts of figures rise up, and suns and moons. They go on speaking—ah! here the child burst into a loud cry; 'ah! now a beautiful woman, so bright and shining like an angel, flies down between them, and kisses the handsome gentleman on the forehead.' 'Enough,' said the magician, withdrawing his hand from the child's head—'Do you see anything now?' 'Our basin,' answered the boy, 'and I am quite tired.' 'Youth,' said Feliciano turning to Schmaling 'thou art now on the right road; follow it with courage and steadfastness, and thy reward will not fail thee. The leader in whom thou confidest is the true one, or else the goddess of wisdom would not have descended, nor imprinted, as the child saw her, a sacred kiss upon thy brow.' He then gave his hand to the youth who kissed it with reverence and devotion.

"Anthony was in the highest degree confounded and surprised, and in the tumult of his feelings, could neither arrange nor collect his ideas. The whole of what had taken place was so foreign to their plan, Anderson seemed so changed, indeed so totally different, that on attempting to address him he could not utter a syllable. The magician gazed at him with such ardent piercing eyes, that he could not meet them, but looked on the ground in embarrassment. The Professor was equally perplexed, for the scene was so strange and unexpected, that he felt no longer at home in his own room.

"The magician was the first to break the silence. 'Anthony' said he, 'you thought to deceive your friend by the aid of a stranger, and in your shortsightedness you have deceived yourself. Know, then, that I am really and indeed that far-renowned Feliciano, whom the world has formerly known under other names. You are astounded. You still doubt?' He here took hold again of the child, placed it before the table, muttered a few words, looked fixedly at the ceiling for some time, moving his lips but giving utterance to no sound, and then again laid his right hand on the head of the child. 'What do you now see?' he demanded in an imperative tone. 'Green trees,' said the little boy; 'a village—now a pretty little cottage, with a meadow, and a stream, and a mill not far off. A young gentleman is walking there; I know him too; he often comes to our

house ; he is here now. Look, a pretty girl comes out to meet him and they go into the cottage together.' Anthony turned pale. He had risen from his seat, but sunk down again trembling and alarmed.

"The boy proceeded, looking still into the glass—'Now they are quarrelling in the room ; she takes a picture from her bosom and stamps on it with her feet. She tears her hair, and runs out towards the water, crying and shrieking.' The magician here took his hand from the head of the child : instantly a flash of lurid light gleamed through the room, and a loud clapas of thunder shook the house. The cloudy figure of a woman appeared on a sudden, with her hand outstretched as if menacing Anthony, who fell terror-stricken from his seat to the floor. Then all disappeared and the lights burned bright again as before. 'And now,' said Feliciano, turning to the Professor, 'shall I convince you too that I am the real magician and no impostor. Shall I tell you your most secret plans and thoughts, or predict your future fate ?' The professor, pale and aghast, could scarcely reply. 'You thought, said Feliciano, raising the terrified Anthony from the ground, 'that no person in the town knew of your connection with that unhappy girl whom you are sacrificing to your selfish feelings. This is the last hour ; you may still save her.' It was already late, but Anthony rushed out of the house at once, mounted a horse, and galloped to the cottage of his mistress. The magician had disappeared, but no one had seen him depart."

These exploits of Feliciano which soon became known in the town caused, as may be well supposed, the greatest sensation. Every one sought to make his acquaintance, and no party was complete without him. He found in a short time a great number of adherents and friends, and the most important individuals, and even the nobility were candidates for his favour. He pretended he could only stay a short time, because great and important matters required his presence in the north ; his secret studies, too, he said, prevented him from going much into society. Mysterious arts, wonderful cures, miraculous elixirs, and supernatural revelations, were now the only topics of conversation : old and young, wise and foolish, indeed, all the characters to whom we are introduced, with the exception of the forlorn Clara, give in to the delusion. The Professor's son who has now become a magical performer of uncommon proficiency, is inseparable from Feliciano, to whom his father appears to have consigned him. Anthony, after having married the peasant girl to whom his relation had been so strangely divulged by the magician, returns to swell the train of the latter, and

figures as one of his most ardent disciples. Sangerheim—whose character is that of many who are mixed up in such dramas ; and who is himself half-deluded whilst engaged in deluding others ; who with an original tendency to credulity, has practised deception until he has himself become its victim ; who has so long tampered with what is morbid and mysterious, as to have no sense left for the healthy and natural—Sangerheim is as much dazzled as the altogether uninitiated by the brilliant performances of Feliciano ; and he, together with Huber, the Physician, Schmaling and Anthony, throw themselves at the feet of the master, imploring to be fed with a few crumbs of his sacred knowledge. From amongst the crowd of his worshippers the sage chooses as his favourite Schmaling, the quondam lover of Clara, but whom now Sophia, the goddess of wisdom, has kissed and sundered from all mundane ties : he is an elegant, handsome, fascinating fellow, and the magician evidently anticipates that when once fairly launched and irretrievably committed as a marvel-monger, *il ira loin*. The picture which Tieck draws of the town, now that the magnetic and masonic fever has reached its acmé, is highly characteristic of the satirical style of this author, and raises a bitter laugh at the expense of our foolish human kind. It is a species of reform-mania, acted by very different performers, and under far different colours from any we are accustomed to see in this land of politics and practicality ; but whether the public dreams of an El Dorado of equality, or of a magnetic regeneration, matters little ;—the absurdity of the premises, the extravagance of the conclusions are the same. Every now and then in cities, states, or even continents, man is seduced from working at the arduous road which providence, his task-master, has ordered him to cut out, and which, whether he will or not, whether he deserts it for a time, or attempts to abandon it altogether, he must finally take, or lose himself hopelessly ;—from this he is ever and anon seduced, to find, like an idle labourer, solace in the intoxication of a dream, or to listen to some plausible plan for making a short cut to happiness. Whether a nation in the book of history is infected by political fever, or a German town in one of Tieck's stories suffers under masonic delusion—the moral is the same. The more men wander from the old, beaten track, the nearer they esteem themselves to the goal to which that track alone can lead them. The wilder their speculations, the more confident they feel of their certain and rapidly-approaching

realization. The more transitory and fantastic their dreams, the more assured are they of their reality, and that they have risen to stand for ever. Towards illustrating human delusion therefore, truth always has been, and always will be stronger than fiction. Man cannot imagine himself so weak and credulous as he really is.

That singular self-complacency which prompts the deluded to be superfluously confident, and to indulge luxuriously in day-dreams of peace and security, whilst danger is evidently imminent; that smile with which man is led by fate to the slaughter,—has been graphically delineated by Tieck, and frequently imparts at once the simplest and deepest tragic interest to his descriptive scenes. How fearful often is the storm-foreboding calm in the first part of the “Hexen-Sabbath:” the heroine, the beautiful Catherine, the boast of the good old town of Arras—a woman no longer young, but on whom every succeeding year has heaped fresh charms, who has been at once depressed and ennobled by suffering, and in whom melancholy grace finely tempers the lustre of full maturity,—collects round her a circle of friends, priests, gay knights, fantastic painters, none of whom can resist her magic sway, and which is all the more potent for being exercised without consciousness or effort on her part. How charming are their meetings; how unsuspectingly they sport like chosen children of fortune in the sunshine which has suddenly burst forth, and which they fancy will never be obscured, though passions of ill-omen soon forebode an angry change. It is in the fourteenth century; modern philosophy has dawned; the fastnesses of superstition have been invaded; our company (which is worthy of Boccaccio for an historian) fondly dreams that man has changed his evil ways, and that the earth is young again; when lo! Catholic bigotry rears at once its gaunt form, in this case more brutally ignorant and pitifully stupid than ever, as if to mock the first beams of modern civilisation, and at the outstretching of its dire hand, the fairy revels of the sweet Catherine and her accomplished company are at once and for ever closed;—she, the queen of all hearts, for having in frolicsome mood personated Venus (who by Catholic priests was very shrewdly held to be the most dangerous of devils) and for having held a Paphian court, is dragged to vulgar execution, for the cry of witchcraft having been once raised, none can stay the fury of the fanatics, until it has been glutted by a certain amount of victims; several of her friends share the same fate; others are dispersed; and a general gloom shrouds

the living, compared with which the contemplation of the sleep of death in which the heroine is wrapped affords a genial relief to the reader: indeed so tragic is the conclusion, that the clamourers for poetical justice who thrust upon Lear the burden of life to counterbalance, as they good-naturedly imagine, his load of other miseries, would sadly complain of it; the sole retributive chastisement which the author deals to the bigot-in-chief is showing that he is a poor, weak, ridiculous mortal in himself, the miserable victim of his own folly; but this only embitters the reflection that he possessed the power of destroying such exquisite creatures as the fair Catherine, and that compound of child-like simplicity, and original genius, the painter Labitte. Should Catholics really threaten England with ascendancy, we may be tempted to give a complete analysis of this masterly story which so well portrays some of the features it still carries under its modern mask. For the present we return to the “Marvel-Mongers,” who just now have especial claim on our attention.

The exploits of Feliciano, then, have completely turned our German town topsyturvy, and not a citizen meets another in the street, who does not hasten, instantly, without thinking of health, weather, or any of the traditional topics of conversation, to inquire after magnetism, masonry, and magic, or to relate the prodigious strides made in *the science* since the clock struck twelve at noon yesterday;—strides longer than the whole race of man had made for a thousand years previously,—or to contemplate with mingled awe and admiration the ultimate results of this wondrous movement. In the midst of the ferment, it is the grand object of the great Feliciano to gain over all the women, and to keep a fast hold of them. He succeeds with an immense number. A lady whom he calls his wife suddenly makes her appearance, and founds a lodge for ladies, of which she is appointed president; the members wear mystic signs, recognize each other by a particular salutation and pressure of the hand, and talk of nothing but the progress of wisdom and science: their ranks are every day swelled by fresh accessions, and they are joined amongst the rest by the mother of Clara. Indeed it is evident that the magnetic millennium may be considered to have all but commenced.

Clara is almost the only person who successfully withstands the prevalent infatuation, and in proportion to its progress her aversion to it increases. Having remained true to her natural instinct from the beginning, what others consider as adding farce to

demonstration, she only regards as adding absurdity to error. Is it not a satire of our author on German intellect, that the men in this story are all deceived with the greatest facility, and that a young girl is the sole representative of common sense?

"How can man," said Clara in an excited mood to her father, "be so perverse as to look for his salvation in that which is precisely the reverse of natural? In truth, as human beings we only feel right when everything goes on in the usual way, when that which evidently ought to take place, occurs simply and unostentatiously. Whenever a great deed is performed in our course of life, or a noble sacrifice is made, it delights us so much the more, that the godlike within us springs from our household nature, that we should all be capable of it, that there is no soul which may not reach a sacred dignity. We even shrink with repugnance from nourishment which seems foreign to us, or which has been prepared in a way displeasing to the unvitiated palate: but more disgusting than assasætida to the healthy taste, must be this highly-spiced farrago of superstition, credulity, and crazy stupidity to the healthy mind."

There was a considerable difference between Feliciano and Sangerheim, with respect to their characters and objects, as well as with regard to proficiency in their common profession. Feliciano was a thorough-paced adventurer, a consummate practitioner, trading on his own account, utterly devoid of principle, and utterly reckless of consequences. The most sceptical and least imaginative of mankind, he was a genius made to play with certain effect on the credulity and imagination of others. Sangerheim on the other hand was no true adept, but a fool who had considerable faith, not of course in the tricks he himself performed, but in the mysteries of which he sought to render himself worthy: he was, moreover, a tool in the hands of a secret society, which employed him at first for its own purposes, and afterwards as we shall see left him in the lurch. He was an adherent of the Catholic faith which the other rejected as a much too modern religion. These worthies converse on their respective systems of philosophy before a company of their disciples.

"Great Master," said Sangerheim, "your spirit is mighty, your voice is powerful as a storm, and you preach like one inspired. That which you prophesy I have understood;—but the superiors whom I must reverence also deserve your respect, and would perhaps cause you to modify your opinions, great as you are, and as long as you may have been a prophet." "Me," said Feliciano, "have I not perhaps long known these masters of yours? The question rather is whether they would know me were I to

stand before them." "What do you mean, Grand master?" asked Sangerheim. "You have always to ask; you know nothing without asking," answered the magician excited, "and yet you aspire to the rank of a master. You say you have superiors—Good. But there is perhaps one above all these superiors, one which they are forced to serve and obey, one who only imparts to them such a degree of knowledge as he deems convenient; and who thus allows them to promulgate various systems, all of which he still regulates from his elevation, and renders subservient to his will. Thus some call themselves Catholics; others Protestants; these are Rosicrucians, those Templars: here we have illuminati, and there rationalists. But may not all these be governed by some unknown, secret superior? And is not the tradition that this is the case preserved in your order—you know so much?"

"Who are you?" exclaimed Sangerheim, in the greatest trepidation.

"I am that I am," said Feliciano; "do you recognize me now? Whether I call myself Feliciano or one of my older names, is of little consequence to the uninitiated. But if you are indeed a Seer give me a sheet of paper and a pencil, and by means of a symbol I will tell you in an instant who I am. Only show it to nobody."

"He wrote something on a piece of paper, which Sangerheim took, and on looking at it instantly turned pale. 'I see now,' said he, 'that you are that true Superior, whose symbol is only shown to those of the highest consecration. I bend my knee and bow my spirit before you.'

"This last decisive avowal filled all who were present with the greatest reverence for the Count, who now rose, made a sign, which was intelligible to all, and said; 'By virtue of my office, I herefound a lodge.' All stood up. The Count took the hand of Sangerheim, and said: 'Young man, you are in a dangerous path, but you are so far advanced, that I can only warn you, I can and dare no longer guide you. You know the spirits, you summon them, and they obey you; but they know you better than you know them. To you they are strange, mysterious, inconceivable beings, but to them you are perfectly clear and intelligible; so much so, that they are conscious of everything which passes in your mind. But with a true magician exactly the reverse would be the case; he is beyond the understanding of his spirits, and fills them with fear and trembling: he makes them his slaves, and never admits them to familiarity. Therefore, beware!' The Count then left the room in solemn silence, and Schmalting followed him trembling."

The delusion has now reached its acmé in all quarters, and in some has shown symptoms of decline. The blundering tactics of Sangerheim, who always promised more than he could perform, have nearly undeceived Herr Seebach, and he appears willing

once more to abandon his youthful favourite pursuits. The manœuvres of the magnetists with the ladies gave rise to some scenes of not the most respectable description; the lodge which had been founded for the promotion of "divine philosophy" was more productive of amorous intrigues than any thing else: several ladies, married and unmarried, became violently attached to the magicians, more particularly to Feliciano, who rejoiced in a very wide circle of female admirers; the town was continually surprised by the news of a fresh divorce; and at length it began to be deemed very suspicious to belong to any of the new societies. With the exception of the elder Seebach, however, the men had hitherto remained firm in the good cause; but now, immediately after the conversation above recorded, Schmalting obtained an insight into the heart of the mystery, which quite satisfied his curiosity, and sent him home at once to his Clara, an undeceived, abashed and repentant lover. We have already observed that he was a great favourite with the magician, who was glad to have him constantly near, and whom he accompanied home after the grand scene with Sangerheim, and the extemporaneous formation of a new lodge. The novice could now hardly suppress the awe with which he regarded the unknown superior. The latter, who had drank a good deal in the course of the evening to enable him to keep up his part, could no longer resist the impulse to lay aside his assumed character, to relax with Schmalting as with a private friend, and to indulge in his native feelings. Continual restraint and hypocrisy were insufferable—he had for some time been seeking a confident, and now imagined he had found one in Schmalting. When, therefore, the latter, following him into his private dressing-room, exclaimed: "May I dare to accompany you, greatest of mortals—perhaps an immortal," he could scarcely prevent himself from laughing in his face. His self-satisfaction, triumph, and exultation at having so neatly outwitted his rival, and bamboozled the whole company, he could no longer conceal. The acolyte to his astonishment saw the master reel with a most profane motion to the nearest seat. "Ah! my child," said he, "you are here then—that's right—I want to chat with you a little." He then got up again, went to a cupboard, took out of it a glass and a strange-looking flask, and said, "I have drunk and talked rather too much to-night. That's wrong. I must now drink myself sober with some of this spirit which is ten times stronger than any we have been taking. Will you have a drop?" he continued, after emptying a glass himself. The astonished

Schmalting wetted his lips with some of the spirit, but could not swallow it from its burning strength. Feliciano smiled good-humouredly. "Child," said he, "no man in the world has ever pleased me so much as you; go with me and be my friend and true scholar, and I'll teach you all my wisdom. The other people are so stupid and disagreeable; I never met with any but you I could open my heart to. What is there more you want to learn from me?" The voice of the man faltered, and it seemed as if the Egyptian wine, as he called the spirit in the flask, had a contrary effect to that which he had anticipated. Schmalting was embarrassed, but could not at first give voice to his rising suspicions. "Great Master," he said, "I should like to know, if I may be allowed to spend a few minutes with you, in what manner the spirits have it in their power to injure Sangerheim?" Feliciano burst into a loud laugh, which he kept up for some time, and then replied—"Boy—boy—don't be a fool. What I have been talking about yonder, hang me if I can remember now, but I imagine that that fellow will get into a pretty mess with his spirits and tricks, for the dolt seems to believe in them himself." "Believe in them himself!" cried Schmalting, with the greatest astonishment. "Yes, my darling," continued the magician, "and for that very reason he will make a nice business of it. He deceives the world and his disciples, and that is just and proper; he conjures up ghosts in the way with which all of us are acquainted, but he must be the veriest ass in existence to be deceived by them himself. I see his masters as he calls them have made the man so inconceivably stupid, that he verily believes in the possibility of some miracle or other." Feliciano was now apparently so far gone as to heed none of the consequences which might result from his imprudent confidence. Having once set his tongue in motion, he could not stop it, so long as any of his secrets were behind. He first gave free scope to his affectionate feeling for Schmalting, telling him that he should receive all the masonic honours in a lump, that he was too handsome a fellow to be any longer a mere dupe, that he had a brilliant career before him, and that all the women would run into his arms. After these seductive promises, he proceeded to explain how he had accomplished the performances which had earned him his reputation in the town. He had spent some time there under the name of Anderson; had busied himself about the secrets of various families, which he regarded as his stock-in-trade; and had discovered amongst his multifarious inquiries the connection between Anthony and

the peasant-girl. Being himself the real Feliciano, nothing could happen more fortunately than his being requested to assume that character. Of the peasant-girl he had a full-length picture made, which at Ferner's house his servant exhibited for an instant at the proper time, making use also of the other apparatus for producing the thunder and lightning; the domestics of the professor having been first of all prevented from interfering. With regard to the child, he thus explained its ready connivance.

"'It was a sweet child,' he said, 'a remarkably clever boy. No one could believe it, who has not found it to be the case so often as I have, that the rogue is, as it were, ready-made in every child, and only wants calling out. Lying, natural to most children, only requires a little encouraging and rubbing up to succeed better than in grown-up people, who always err in being too cunning, too complicated. One of these children be ome quite inspired when employed to deceive its elders and superiors, and learns such a lesson far better than any at school. I had already instructed this boy as to the part he was to play.'"

He then proceeded to initiate Schmaling into a few of the general principles of his art.

"'My dear fellow,' said he, 'don't you see that he who means to deceive mankind, must never stick at trifles. If he appears very clever and cunning, the minds of people are instantly on the alert; they watch him carefully, examine cautiously his proceedings, and he is continually in danger of being found out. He who knows mankind need never be afraid of laying it on too thick. If you were to tell your disciples that you had been acquainted with Charles the Twelfth, they would laugh in your face; but if you were to broach the subject by gravely assuring them that you had cracked a bottle with Julius Cæsar, they would believe you. Therefore, my dear, let me persuade you to wander, with me as your master, through the wide world, and we will share together its spoils and treasures. Remember, I am chief superior—Ha! Ha! I've slipped through a good many lodges in my time, and in one of them some Rosicrucians showed me in great confidence a symbol which represented the Messiah, who is one day to come and found a heavenly kingdom upon earth. You saw with what exquisite assurance I nonplussed your great master with this trifle. No, as an honest industrious man I might starve, but as a celebrated charlatan I'm as rich as Cræsus, and have my men and women under me like a Sultan. Does not this prospect tempt you, my dear? You are so much handsomer than I am;—how you'll enjoy your youth! I have always wanted a charming fellow like yourself to render my exhibi-

tions complete. What an angel the women will find you;—who knows that we sha'n't get a queen into our net;—who knows—but come with me only—.'"

The Egyptian wine here took full effect, and the magician fell asleep. Schmaling, of course, now considered himself fully initiated; and having nothing more to learn he went home with a determination never to see the magician again. He prevailed upon Clara to forgive his past delusion, and the tale which he had to tell showed that he had good reason at any rate to consider himself effectually cured at last: so the young lady comforted him with promises as well as consoled him by her pardon. He needed consolation, for scarcely had he collected his senses, and told his pitiful tale, when the devotees of the magicians were hawking about the town the news of his abominable treachery. When Feliciano awaked from his Egyptian sleep, he had a terrible but vague recollection of having been remarkably indiscreet the preceding evening; Schmaling was no longer in his house; he caused him to be sought for at Sangerheim's and his other usual haunts, but without success; at length he heard that he was gone to Seebach's, and he guessed the truth: his measures were instantly taken: an anathema was hurled against Schmaling as a fallen brother, who had been found utterly unworthy of partaking of the blessings of illumination, who was about to betray the secrets of the order in the most scandalous manner, and to calumniate the masters by the most horrible lies: formal notice was sent to every lodge of which he was a member instantly to eject him, and every faithful member was ordered never to mention more the name of the atrocious apostate. The only result of this misfortune was that the other proselytes, warned by the dark fate of Schmaling, became more warmly attached than ever to their great masters.

Feliciano shortly left the place with a large troop of adherents for the capital of a northern state, where his success was far more brilliant than that which we have hitherto described.

But Sangerheim, instead of turning, like Feliciano, the difficulties which he encountered to his advantage, became every day more entangled, and less able to extricate himself from them. His wife, a poor nervous creature, whom he had magnetized for his mystical purposes until her whole system was shattered and wrecked, and by whose assistance he had been enabled to find the lost document in Seebach's deserted house, died suddenly in a fit of ecstatic delirium, in which he had tormented her

with questions beyond the stretch of her feeble powers. Of Herr Seebach he had borrowed a considerable sum of money, leaving in his hands as security a parcel, the contents of which he pretended were highly mysterious and valuable, and which he pledged himself to redeem on a certain day. The day came, but no Sangerheim presented himself to fulfil his sacred promise. Seebach, however, instead of opening the parcel, sought out the magician, and asked him what was to be done with it. The affairs of the latter had now arrived at a crisis. The foreign lodges with whom he had been in communication, and whose willing instrument he had ever shown himself, had now shaken him off. He at first believed that something great and good was to be effected by his labours, and understood that they were to tend to the progress of Catholicism; but he now knew not what to think, and was become in fine the sport of his own fantastical ideas, his morbid cravings for mysterious power, and his vague and chimerical belief. The terrible consciousness of his real nature and situation was ready to dawn upon him, but he still managed to keep it down by appealing to those visions of future glory with which he had hitherto so constantly fed his vanity and ambition. Thus he was at last become a fear and terror to himself.

In his own mind rose doubts and sorrows which threatened soon to undermine an intellect originally weak, and which had never been properly cultivated, but still farther weakened by neglect, or by slavish prostitution to a morbid imagination. He had thus within himself laboured to bring about a fate, which the force of circumstances also now rendered inevitable. But it was easier for the weak man to die in delusion, and save what he called his honour, than to avow his errors and enter at a late hour on the path of honest reform. He dared not even ask conscience for a real opinion of himself; much less was he likely to make full confession to Seebach, though the latter was evidently amiable and forgiving. Accordingly, to the astonishment of his creditor, he met him with a confident face, and promised him full satisfaction on the morrow. His resolution was taken. The next morning he invited Seebach and Ferner, together with Huber and some of his more attached disciples, to take a walk with him out of the town. He appeared in a very solemn mood, and disposed only to talk on serious subjects. On reaching a solitary place, he suddenly stood still and complained that what Feliciano had said was quite right, viz. that he found great difficulty in governing

his spirits, and had often severe struggles with them. "They do not easily tolerate," he said, "that a mere mortal should exercise uncontrolled power over them. I must never be off my guard for an instant. If I were to omit certain prayers, or neglect to take certain measures for my safety, my life would instantly be endangered. How many men who have at first succeeded in subjugating the world of spirits, have nevertheless at last died an unnatural or violent death." He then went on to say, with an expression of alarm and agitation on his countenance:—"Even at this very moment I am in danger from my familiar spirits. Excuse me, my friends—I must be alone for an instant—wait here. I will return immediately when I have made them recognize me as their master, and taught them not to menace me again." As he concluded this sentence, he assumed a triumphant mien, and appeared fully confident of his own powers. He left the company, which remained in the same place awaiting his return with the most excited feelings. He retired into a grove at a short distance, where a noise was soon heard as of several voices in dispute, amongst the hubbub of which the loud and imperative tones of Sangerheim were from time to time distinguishable. At length a loud report as of fire-arms burst on their ears, and then all was silent. They rushed to the spot and found the magician lying dead on the ground, and a pistol near him. "The spirits have murdered him," cried Hubert, "the miserable fiends! O dearest of my friends, thus then hast thou fallen a sacrifice to thy enthusiasm, and to thy ardent zeal for science." Seebach said nothing; to him the scene explained itself. Most of the illuminati of the town believed that Sangerheim had been destroyed by his familiar spirits, as a punishment for his errors, and for his wanderings from the true path taken by Feliciano and the orthodox adepts. The immediate followers of the deceased, however, rebutted all these explanations of his fate, and elevated him to the rank of a martyred saint. Even when Seebach opened the mysterious packet, and found in it only an old French grammar, three old almanacks, and a quantity of waste paper, far from being undeceived, Hubert, as their representative, exclaimed:—"The malignant spirits, not contented with his murder, have transmuted into these valuable pages the mysterious legacy of his wondrous life. But we must not allow ourselves to be deceived—after a certain time during which the charm is allowed to last, the true writings will be found again to have taken the place of all this waste paper. I therefore

in the holy name of our art take possession of these documents, in order to save them from destruction. It is possible that somewhere in this volume, between the pages, or in the stops, or underlined letters, the mystery is explained."

Thus does folly ever flourish, and so little reason has the impostor who is only true to himself, to die in order to escape detection.

The town in which all these events transpired returned at length to its wonted quiet. Schmalzing and Clara married, and the former was wise or happy enough afterwards to sigh for no more mysterious magic than that of the smiling face or beaming eyes of his lovely wife, and to find in domestic felicity charms beyond the potency of magnetism or magic. But not till after many years had transpired, did Anthony return to the bosom of his family,—a repentant, but almost a ruined man. His wife had sometime before mysteriously disappeared; but Feliciano had given him to understand that he need not make himself uneasy on her account, for that she had made astonishing progress in the *science*, and was now enjoying her exceeding great reward. Ferner had heard nothing of his son; but some fifteen years afterwards, during a visit he paid to the south of Germany, found him at a fair performing as a conjuror; shame had prevented the poor fellow from returning home, but he was now reclaimed. Feliciano himself after numerous adventures fell at length into discredit with the public, and finally into general contempt. The tale terminates in a manner peculiarly characteristic of Tieck. Seebach in his old age shows a disposition to relapse again into the follies of his youth. His family observe to their great disquiet, that he is very absent in company, fond of spending his time alone in his private cabinet; that in short he is evidently attacked again by the old complaint. Letters arrive, written in a pious and mysterious style, and the old gentleman, though very little inclined to be communicative on the subject, cannot withhold in a confidential hour an intimation that he is in correspondence with some highly honourable and trustworthy individuals from whom he is in daily expectation of hearing something highly important. These letters came from the south of Germany, and spoke of secrets which were not to be desecrated by divulgation to the ignorant or unworthy, but which might by degrees be unfolded to the tried disciple. Seebach related to his new friends his adventure with Sangerheim, and the evident mistakes made by that worthy individual, as well as the doubts he had hence conceived with regard to the

whole subject. He received in reply a communication beginning as follows:—"Beloved Brother in the Lord: The information you give us with respect to our lost brother Sangerheim is not new to us. It is true that unhappy man was connected with us, and some revelations were made to him, as to a hopeful disciple. But when he left us he fell into the hands of certain lay men who busy themselves with projects of temporal aggrandizement, and thus desecrate the heavenly jewel." He was then indulged in the usual promises of something magnificent to be shortly revealed. If, said the writer, you are not for our church, you are at any rate not against it, and therefore we shall treat you with the greatest confidence. He was finally requested to receive a person who might come to him under the name of Emanuel as a messenger from his correspondents, and to entertain him accordingly; for Emanuel he was told would deliver the first jewel to his faithful hands. Seebach's expectations were now not a little raised; and they were shortly satisfied, for Emanuel did not long delay his visit. About ten days after his receipt of the letter, the servant announced that a singular looking stranger was at the gate, who said nothing but the one word "Emanuel." Seebach ordered him to be instantly admitted, and a venerable old man entered his cabinet, who closed the door solemnly behind him, and then began a mysterious conversation. Seebach felt himself wonderfully edified and strengthened; he had never before seen the doctrine of prophetic faith, and of a sole Catholic Church, placed in such a striking light. On taking leave, the stranger drew a packet from his bosom, kissed it with devotion, and handed it humbly and reverently to his host, saying: "Beloved brother, this is the first pledge of the high association, invisible to ordinary gaze. Spare the seals for the present, and break them not till the solemn hour of midnight. Till then you will do well to prepare yourself by pious exercises. It is true this precious gift will still be unintelligible to you, but its mere presence will protect you from all harm. The explanation will be sent you, when this moon has waned. But—silence! We show at any rate how we honour you, how highly we esteem you." The interview terminated by a solemn embrace; the sage left the room with a serious mien, and Seebach could not but confess that no human being had ever before made such a profound impression upon him.

In the evening he shut himself up and ordered that none of his family or servants should interrupt him. He was in a very ele-

vated mood. He read in the New Testament, and seemed to himself so young again, so full of new faith and hope, so pious and pure, that he was neither able nor willing to suppress tears of deep emotion. At length the clock struck twelve, and he opened the sacred packet, without breaking the mystic seals. He undid and laid aside cover after cover, and at length came to the jewel itself, which was no other than—the silly figure with the word *Abracadabra* written on it in various ways, of which mention was made at the commencement of the story. He burst into a loud laugh, which, however, soon gave away to serious reflections on his own inveterate folly. He then called his family round him, explained to them the whole affair, rejoiced with them that now at any rate they might all consider themselves cured of their delusions, and exclaimed:—"As it is granted us to be rational, my children, let us be so." The servants received orders to allow the sage, when he returned, to repeat the word "Emanuel" at the gate until he was tired.

We must here for the present take leave of our author; again assuring our readers that with respect to purity of style, moral tendency, and philosophic truth, no more estimable works can be found in the whole range of German literature than the "*Novellen*" of Tieck.

ART. VI.—1. *Póchod ot 1814.*

2. *Geschichte des Feldzugs von 1814.* Riga, 1839.

3. *Histoire de la Campagne de l'an 1814.* Paris, 1839.

4. *History of the Campaign in France in the Year 1814.** By A. Mikhailofsky Danilefsky. Petersburg, 1838.

THE fall of that gigantic despotism which had been formed from the ruins of all social institutions and swayed by the wrecks of all recognized principles, and which equally by its physical and moral constitution weighed down to dust the independence, not of kingdoms alone but even of the civilized mind, has now become matter of History; and of Philosophy also, as the most gorgeous and fatal of illustrations that point a moral or adorn a tale for the advantage of mankind. Every hour mocks the schemes of individual hopes; every year shows the

fallacies of general expectation; every age in its turn displays the fragments of mighty aims and established dynasties, the boast and worship of nations; but it takes centuries to produce so various and complicated a mass of mischiefs as France for the last fifty years has presented to our eyes, and so vast and wide a destruction of Princedoms, Virtues, and Powers, as marked the duration and accompanied the catastrophe of that fearful crisis.

Yet, in proportion to its fearfulness and extent, is excited the interest that attends the principal actor in that scene, the chief agent in the work of depopulation. All substances of nature are fused in the volcanic lava; the thunderbolt is engendered only by the war of the elements: scarcely less wild than the latter were the furious and frantic convulsions of that revolutionary paroxysm the direst energies of which were combined and condensed in the cold, stern bosom of its child and champion; whose fervid genius blended aims and accidents, strength and weakness, devotion and fear, courage, skill, wisdom, follies, ignorance, and terrors;—all powers, all properties of mind and matter in fact, to conduce but to the one end, of indiscriminate desolation.

So fierce a phenomenon in so enlightened an age, that marvelled at the worship of Moloch in former times, and yet crowded in emulation to idolize a fiercer destroyer; one, too, unsupported by superstitious reverence; is a fact strongly militating against that ideal approximation to the acmé of perfection which delights the sages of perfectibility. The name of liberty maddened half Europe in favour of France; the loss of liberty maddened all Europe against her chief; and we who have survived both the blooming canker and the counter-irritation, yet regret that the latter went so far, or no farther; and turn our eyes back in admiration to the former, as a glorious, even though a fatal destiny.

This spirit of exaggeration for the past, of necessity depreciates the present, and would fain trample it down to make room for an exaggerated future. The principle is in human nature, and acts most eagerly when it acts in masses; it is wise then in those who have views of selfish advantage, to exaggerate the benefits of the courses by which such advantage is to be reached, and to insist on removing all checks to the simultaneous action of the multitude: for this is the only way to attain the end and avoid foreseeing its consequences: a pause, a check, a single warning voice, might give time for reflection and awaken the dormant reason. Such obstacles must be removed

* London: Smith & Elder, 1839.

at whatever cost and sacrifice from the state. The democrat of this hour has the past example of France before him for this ; and Napoleon himself was but a type of the same passion, for Napoleon was the Demagogue of military France.

The writer before us, though strictly military, seems impressed with a tendency opposite to the last. Far from being a democrat, which no true courtier can be, he indulges, naturally enough, a leaning to the opposite side. He develops as little of political principles as a good Russian imperialist ought, especially one who has been aide-de-camp to an Emperor ; his bias is in truth exceedingly gentleman-like, for it is all for the court : and in his honest and national hostility to Napoleon, he strives for an antagonism of a singular cast, and would fain make Alexander the Demagogue of Absolutism.

This is exceedingly proper, no doubt : and if it is not practicable there is the less harm in it. But however popularly at home the Czar may be regarded as a father, none but a good Czarovitch,* if we may so use the term, unaware of the difference between his native serf and the free peasant of other lands, would hope to enlist the sympathies of freemen in favour of absolute power, and this too by showing that it sought, steadfastly and steadily through all things, its own objects alone. We, who have so recently seen and resisted the Russian tendency to intrigue and aggression, can feel little or none of that overflowing admiration which turns M. Danilefsky's very ink into gold fluent in praise of the Emperor, who sought always unchangeably to remove in Napoleon the great continental obstacle to his own acquisitions in the East.

The book, however, is almost entirely military ; and viewing it in this sense, independent of its absolute merits, we can cordially sympathize with the honest prejudices of the writer, the honourable and patriotic feeling with which he dwells on the services and deserts of his gallant countrymen in the great and decisive campaign of 1814, and the care with which he extenuates any faults or errors committed by them. Schooled as men are from earliest infancy in prejudice, in impressions that result from the collective experience of others, the attempt in maturer years to examine them all would be impossible ; and to deny, resist, or eradicate them without such examination would be ridiculous ; they are affinities of the social, and as such

the links of the natural, existence. The man then who boasts to be devoid of prejudice may be a philosopher, but is certainly a fool ; a deficiency in the heart is a defect in the head : if the passions are seldom right, the feelings are seldom wrong : and there was a general truth in the exclamation of Themistocles, " God forbid that I should not love my friends better than strangers !"

But making cheerfully such allowance for the author before us, we are by no means satisfied that he should claim a great deal more on this head, and go considerably out of his way to demand it. Grant him all the patriotism that beats warm in Petersburg, Moscow, or Odessa ; that bleeds freely at Borodino, exults in the plains of Leipsic, and marches in triumph towards Paris over the well-foughten fields of France ;—the reader who takes him as a guide along the way may well hesitate at yielding a farther indulgence, when he finds this to be a prostration of other powers to the writer's own idol. When the honoured of other hearts are to be debased ; the views of other statesmen to be depreciated ; the interests of other nations to be misunderstood or misrepresented, and vilified and sacrificed according to the wishes and phantasies of the ardent imperial aide-de-camp ; and this too in the shape of constant insinuation against all or every thing that militates against his nationality,—we are tempted to ask, Who made him a judge over us ? to recall the maxim, *ne sutor ultra* ; and to remind the writer of that first principle in his own gallant profession, not to occupy a larger extent of ground than he can defend.

It is obvious, as we have just intimated, that the writer before us is a devoted adherent of the late Emperor Alexander, and that he has a strong tendency to convert every thing into incense for this one idol. The book is clearly written for the atmosphere of Petersburg ; but it is intended to be read elsewhere, for a portion of it is designed to answer some statements in the Prussian account by Varnhagen van Ense : and farther, as censures by implication are included against England also, and this by an officer attached to the person of the Emperor Alexander, and therefore doubtless aware of that monarch's own private impressions and sentiments, the work is valuable as a sort of semi-official record of these. But from this very circumstance it becomes the more incumbent on us to set our readers on their guard as to some of the mistatements or exaggerations it contains.

It is nevertheless necessary to separate distinctly the political and invidious portion of the volume from the simple narrative of

* Child of the Czar (Prince).

the battles and operations of that so memorable campaign. This narrative, we are bound to say, does ample credit to the author, from the clear and soldier-like conciseness of the style and the general distribution of the events. Every thing is in proportion throughout; the connection of all the parts is carefully observed; and the transition from one to another portion of the narrative so easy and natural, and the succession of events so full and perfectly maintained, that complicated as such a course of operations must be at any time, and more especially when carried on upon so vast a scale, with so many various objects, such incidental diversities and changes of views, and such difference of interests, still the whole is combined by the author before us into one complete and unbroken series; one moving, mental panorama, that, while it forcibly depicts and impresses the whole course of the campaign on the reader, leaves him also favourably impressed with the unity and completeness of design, illustrated by the writer's skill, that formed and arranged the whole plan and movements of the campaign, and stamped upon the infinite complexity of the military operations a character of uniform might, simplicity, and singleness.

We commence our extracts from the opening of the volume.

"Russia had already celebrated, before the beginning of the year 1814, the anniversary of her deliverance from foreign invasion, with the appointed religious solemnities and public rejoicings. The grass had again waved green on the fields of Borodino, Tarootino, and Krasnoy, and, from the Moskva to the Niemen, towns and villages had risen from their ashes. Our country had revived with a fresh and vigorous life, and our sovereign, the acknowledged liberator of Europe, was at the head of his victorious legions on the banks of the Rhine. Austria, Prussia, the German Princes, Holland, Spain and Portugal, had thrown off the yoke of Napoleon, who was now engaged in negotiating with the Pope and Ferdinand VII. the terms of their re-establishment on their respective thrones. His near relation, the King of Naples, was only waiting for a favourable moment to take up arms against him. England having renewed her friendly relations with the continental powers, the flags of all nations were again unfurled on seas, on which, during the long period of ten years, not even the peaceful merchantman had ventured to set a sail. To ensure the general tranquillity of nations, there needed but to place an insurmountable barrier to the ambition of Napoleon, and that could only be done by crossing the frontiers of France.

"The campaign of 1814 ought not to be considered as a new war, but simply as the

continuation of the campaign of 1813, which the Emperor Alexander had opened single-handed, and in which he was afterwards joined by the other powers, in the hope of regaining their independence. The victory of Leipsic brought the allies to the Rhine, but did not put an end to the war. The negotiations at Frankfort failed of success, for this plain reason,—that neither side brought any thing like sincerity to the discussion. Alexander warmly insisted on the necessity of continuing the contest, and exerted himself to infuse the same spirit into his allies, some of whom were satisfied with seeing the French driven out of Germany, and pretended that the object of the treaties of offence and defence had been gained, and that Napoleon, forced across the Rhine, was no longer in a condition to trouble the peace of Europe. The Emperor at last succeeded in bringing over the Allies to his opinion, and in getting them to adopt the plan of operations which he had traced; in short, it was finally resolved to invade France, and by penetrating into the heart of that country, to oblige Napoleon to accept of such terms as should re-establish and secure the political balance of Europe."—p. 1—3.

We must, however, here enter our protest against the assertion that Alexander was either the liberator *par excellence*, of Europe, or even acknowledged as such by the Allies at the time. When we recall the ill-success that had in the previous campaigns attended that sovereign's arms at Lutzen and Bautzen, and that notwithstanding all their gallantry the Russo-Prussian force had been driven off the direct line of their operations into a corner of Silesia with hourly diminishing hopes, until Austria joined the coalition, and by her numbers speedily turned the scale against Napoleon, we are, we conceive, fully warranted in questioning this assumption of M. Danilefsky's.

The following statement, from one whose position enabled him to speak with full knowledge of the fact, is on that account highly interesting and important.

"Napoleon was still the recognised ruler of France, and it is certain that at this time the cabinets had not the slightest idea of wresting the sceptre from his grasp, and of handing it over to the representative of the Bourbons, who was residing in England as a private gentleman. On the occurrence of any important event, the latter would take occasion to remind the Allies, by letter, of his right to inherit the throne of his ancestors, and when they approached the Rhine, he requested them to proclaim his legitimate authority; but no attention was paid to his wishes. His brother, the Count d'Artois, with his two sons, was now on the point of leaving London for the Continent, in order to be nearer to the theatre of war,

but not one of the allied monarchs entered into treaty with the Bourbons, or flattered them with promises. Yet in the bosom of him, who was the soul of the alliance, there already lurked the intention of dispossessing Napoleon,—an intention, which though not manifested by any overt act, was no secret to two or three persons, who enjoyed his confidence. Still a sharp-sighted observer might, in some measure, guess the colour of his thoughts from the following maxim, which Alexander, as he drew near the frontiers of France, and indeed during the whole course of the war in that country, frequently repeated, both verbally and in writing, and to which he steadily adhered: ‘We should make the march of political arrangements depend on the success of our arms, and not fetter ourselves with any premature engagements; we should look to victory for the most advantageous conditions of a general peace.’”—p. 3.

The spirit and position of the great antagonist of Europe are next given, and with great fairness, by the author:

“Napoleon’s reflections had led him to precisely the same conclusion, and he acted accordingly. He was not shaken by the successive blows which had annihilated his armies in Russia and Germany. He bore his defeats with firmness, and, on his return from Leipsic, gave his exclusive attention to the assembling of fresh troops, to oppose the general armament against him. He used the utmost activity in the formation of his armies, and tried, by every means, to render the war national. In neither of these attempts, however, was he cordially seconded by the wishes of France, where all ranks were calling out for peace. The reflection of that military glory, with which Napoleon had dazzled France, was now felt to be a feeble compensation for the decay of agriculture and manufactures, the stagnation of trade, the conscription, the loss of husbands and fathers, and heavy taxes. But Napoleon heeded the voice of his suffering people as little as he did the counsels of his friends and the representatives of those public functionaries, who, after years of silence, now ventured to speak out their sentiments on the ruined condition of the empire, and the absolute necessity of peace. The child of victory turned a deaf ear to their respectful remonstrances, and told his advisers that he could not sit on a throne whose lustre was tarnished, nor wear a crown which was shorn of its glory. Inveighing against despondency, he exerted himself to rekindle the warlike ardour of the nation, and to rouse the spirits of his troops to a contest in which he hoped to regain the glory he had lost, and consequently that preponderance in the affairs of Europe which he had once enjoyed. In these circumstances, reconciliation was far off; indeed it was equally

distant from the thoughts of Alexander and of Napoleon.

“While the allied armies were preparing to cross the Rhine, the Duke of Wellington was opposed to Marshal Soult on the southwest frontier of France; and, on the Mincio, Field Marshal Bellegarde was in the field against the Viceroy of Italy; Count Benningsen was under the walls of Hamburg, which were defended by Marshal Davoust; the Hereditary Prince of Sweden had opened the campaign against the Danes, now the only allies of Napoleon; and some Prussian detachments were besieging Magdeburg, Glogau, Cüstrin and two citadels, still occupied by the French in Germany. Almost at one and the same time the war raged in the heart of France, at the mouths of the Elbe, at the foot of the Pyrenees, and on the plains of Lombardy; but the decisive blow was struck on the banks of the Marne, the Aine, the Aube and the Seine, where the shock took place between the armies in the presence of the Allied Sovereigns and Napoleon.

“It was here that an end was put to a long and bloody struggle, and that the fate of the vanquished was decided; for the successes of Wellington in the south of France, of Bellegarde in Italy, and of Benningsen at Hamburg, could not have produced the desired result, if Napoleon had triumphed over those armies against which he fought in person and whose movements and combats we are now about to relate.”—pp. 4, 5.

We consider M. Danilefsky as somewhat disposed to undervalue, in the latter part of the foregoing extract, the successes of the allied armies in other quarters, and more particularly those of the Duke of Wellington. The moral effect of this great leader’s achievements had, as we may probably take occasion to prove in the course of this article, the strongest possible influence on the results of the campaign of 1813, in inspiring the Northern Allies to offensive, decided movements; and the mere fact of his occupying Soult entirely in the south at this critical period of Napoleon’s fortunes, can never be considered a secondary point by any one competent to judge of military operations, and who considers the effects which that great tactician’s vast defensive genius, the very shield of France, must have had while aiding the fearful energy of Napoleon, who, as matters stood, was utterly unassisted by an equal mind.

What different results might have ensued had Soult been left to show front to the grand army of Schwartzburg on its advance, and hang on its retreat at the delicate crisis of Troyes, while Buonaparte was repelling Blücher; and how few might have been the laurels this last gallant vete-

ran could have gathered had Soult supplied the place of Macdonald at the Katzbach, or of Ney subsequently before Leipsic; or had he commanded in place of Marmont, &c. the French army of the North, while his master was arresting the grand army of Schwartzenburg.

"During this campaign, as in that of the preceding year, the forces of the allied Powers were divided into three armies, and remained under the orders of the same commanders-in-chief, who had led them to victory in Germany. The Grand Army, with which the Sovereigns were present, was commanded by Prince Schwartzenburg, the army of Silesia by Field Marshal Blücher, and that of the north, by the Crown Prince of Sweden. His Royal Highness, however, owing to the tardy march of the negotiations with the Danes, was late in reaching France, halted at Liege, and took no share in the campaign. Thus Schwartzenburg and Blücher alone entered the lists with Napoleon.

"In the Grand Army, exclusive of the Cossacks, there were present under arms:—

"Russians	{ Count Witgenstein	20,569
		Reserve 32,839
Austrians		130,000
Prussians		7,100
Bavarians		25,000
Wurtembergers		14,000
Badeners		1,000
Total		230,508

with 680 pieces of cannon.

"To this army also belonged three corps of the troops of the German Princes, amounting to 30,000; but of these, the corps of Prince Philip of Hesse Homburg alone came up and shared in the affairs which took place near Lyons in the month of February.

"In the army of Silesia there were two corps of Russians and two of Prussians, viz.—

"Count Langeron's	27,017
Baron Sacken's	26,556
General Yorck's	18,931
General Kleist's	20,000

Total 72,514

with 436 pieces of cannon.

"Two corps of the German Confederation were destined to form part of this army, but neither of them crossed the Rhine. One of them consisted of the troops of the Princes of Hesse, and the other was under the command of the Prince of Coburg: both together amounted to 44,000 men.

"The army of the north consisted of

The Russian corps of Baron Wintzengerode	35,237
The Russian corps of Bülow	30,000
The troops of the reigning princes of Germany under the command of the Duke of Weimar	25,000

Total 90,237

"To these are to be added the following troops, of which only a very small number took part in the war: some of them did not even cross the Rhine:—

Swedish Army	20,000
Mixed corps of Count Walmoden	15,000
Corps of Germans under the command of the Duke of Brunswick	30,000
Troops of the Netherlands	10,000
British	9,000

The following considerations, too, are important and must, especially the latter part, be taken seriously into the account. The vast value of a friendly population consists not merely in the number of troops it renders free and available for strictly military operations instead of scattering and occupying them in the essential task of securing supplies and preserving communications; it relieves also the chief embarrassments to the execution of bold and hazardous movements, by creating in the commander a confidence that the obstacles actually seen are the only ones to be surmounted, and that few or no unexpected difficulties will arise. This feeling, combined with unity of command, was at least equal to a force of 100,000 men, in the invaded at the time, and is always proportionate to the scale of operations.

"The grand total of the troops, destined to cross the Rhine, thus amounted to upwards of four hundred thousand men. The number of troops which France was able to oppose to the invaders is uncertain, owing to the wide difference in the accounts of the French writers on this subject. Yet, from their own showing, and judging by what we ourselves saw, we are fairly warranted to conclude, that the army with which Napoleon opened the campaign in person, in the middle of January, amounted to a hundred and twenty thousand men. Of course we do not include in this number, the army of the Viceroy in Lombardy, and that of Marshal Soult on the Spanish frontiers, the independent corps of Augereau at Lyons, and that of Maison at Antwerp, the National Guard, which took part in several engagements—or the garrisons of the numerous fortresses on the frontiers of France, to blockade which the Allies were obliged to leave behind them large detachments and even entire corps. In the course of the campaign, the ranks of the French army were filled up with more than fifty thousand men, partly drawn from Spain, and partly from the recruiting dépôts in the western provinces of France, whither the Allies did not penetrate, and where the conscription went on without interruption. But although Napoleon's troops were less numerous than those of his opponents, he had, in other respects, many advantages over the Allies. He was in the centre of his empire, where he was still blindly obeyed, and could avail himself of all its resources for the supply of men, arms, ammunition, and provisions. Fighting

in a country, whose inhabitants were on his side, he had always at command thousands of carts for the conveyance of his troops, and a host of spies to give him notice of the movements of the Allies. Granaries and cellars, which were carefully concealed from us, were freely opened on the approach of the French, who were thus readily supplied with bread and wine; their wounded or exhausted soldiers too, everywhere found shelter and assistance under the roofs of their countrymen.

"Very different was the condition of the allied armies, which had no magazines with them, nor assured communication with the right bank of the Rhine. They poured into a hostile country in severe winter weather, paying no attention to Napoleon's widely circulated proclamations calling on the people to take up arms, nor to those numerous fortresses in their rear, which are so thickly planted along the northern and eastern frontiers of France. We had to struggle not with the enemy's troops alone, but with hardships caused chiefly by the want of provisions; an embarrassment which it was the more difficult to relieve, because the arrangements, made by the respective commanders of the Allies, often clashed with each other. Time was wasted in written correspondence, complaints, and reproaches, while the soldier remained without food. The sick and the stragglers were despatched by the armed peasants concealed in the woods and hollows, from which they issued, especially in the month of February, and falling upon our small parties and couriers, interrupted the communications between the armies, and even between the corps. Still more hurtful was the submission of the allied armies to the influence of certain Cabinets, who frequently differed in opinion, not merely on the score of military operations, but on the very necessity of the war itself. We must farther take into consideration that the allied generals, who were not placed in immediate and strict subordination to one supreme authority, and who differed as widely from each other, in point of personal qualities, as they did in the degree of their dependence on the Courts, were in many respects inferior to him who was looked upon as the first captain of the age, and who was master of his actions and accountable to nobody. We were indeed superior to the enemy in numbers, and to a certain extent in equipment; but with us there was not, and from the very nature of a heterogeneous alliance, could not be, either unity of purpose or of will."

The Russians were distributed amongst the three armies, and the number of Russian troops present in France, with the three allied armies, was made up of

" 1. The guards, the grenadiers, and the corps of cavalry of the reserve -	32,839
2. Corps of Witgenstein -	20,569
3. " " Langeron -	27,017

4. Corps of Sacken -	26,566
5. " " Wintzengerode -	35,237

In all - 142,228."

Some peculiarities of the Russian force and position are also worth extracting.

"At this time there were two other Russian armies beyond the frontiers; that of Poland, under Benningsen, before Hamburg, amounting to about fifty thousand men, and the army of reserve in the Duchy of Warsaw, of eighty thousand, under the command of Prince Lobanof-Rostoffsky. In the course of the campaign, the latter, more than once, furnished reinforcements to the army in France. The total number of Russian troops, beyond the frontiers, amounted, in the beginning of 1814, to more than 270,000 men.

"Count Barclay bore the title of Commander-in-Chief of the Russian army; but his immediate authority extended only to the Russo-Prussian reserve, with which he was personally present, and to which he communicated the orders of the Emperor and the dispositions of Prince Schwartzemberg. His influence over our corps in the main body of the armies in the field, was confined to a general superintendence of their equipments and supplies. This was no easy task, owing to their great distance from home, and consequently, from their resources, as well as to their being attached to different armies, in which they were placed under the orders of foreign commanders, who were under no direct obligation to give themselves much trouble about their well-being. The want of ammunition and accoutrements was often felt; not because there were none in store, but from the impossibility of bringing them up to the spot where they were wanted. Count Barclay was not present with these corps, and could not know of the instructions and orders given to them without his concurrence. With respect to provision, the Allies not only gave little help to the Russians, but often showed perfect indifference to their wants.

"The four persons who were more immediately attached to the Emperor in the preceding year, and who enjoyed the same share of his confidence in the present campaign, were Count Araktchéieff, Prince Volkonsky, Count Nesselrode, and General Toll. The duty of the first was to keep up the full strength of the regiments, and to have the parks complete. To communicate the Emperor's orders relative to military operations, to Russian or foreign Generals, was the duty of Prince Volkonsky, as head of his Majesty's staff. The diplomatic department remained in the hands of Count Nesselrode, who, as well as Prince Volkonsky, was constantly present with the Emperor. General Toll was always, as in the preceding campaign, at Prince Schwartzemberg's head-quarters, whence he sent regular reports to Prince Volkonsky, who submitted them to his Majesty. He also forwarded the Field-Marshal's orders to our flying parties, and, in cases admitting of no delay, even to the Russian corps in the Grand Army.

"While the Emperor confided his troops to the care of foreign commanders, he freely exercised a general influence over both military and diplomatic affairs, and was thus in continual verbal and written communications with the leading commanders, as well as with the ministers of the courts. In the course of the campaign he reconciled warring opinions, rekindled the ardour of those who were growing cold; and, steadily pursuing his aim—the overthrow of Napoleon—regulated the movements of that mighty, but complicated alliance, which, but for him, would not, it may be safely averred, have been crowned with success. His decided opinion was ever in favour of pushing the war to the last extremity; and he maintained it in spite of the general wish of the foreign cabinets. In rejecting peace, Alexander stood single in the camp of the Allies, as did Napoleon in France. The latter would not stand humbled and disarmed in the eyes of a world, which, but the day before, he had looked on as his own. And thus, like two giants, did the mighty rivals go forth, for the last time, to make trial of their strength."

M. Danilefsky's statement of the plan of the campaign, and the positions of the corps, may not be useless to our readers in understanding the subsequent details.

"The plan of the campaign in France was traced by the Emperor Alexander on the 29th October, 1813, at Frankfort on the Main, four days after his arrival from Leipsic: it is contained in the following letter, then written by his Majesty to the Crown Prince of Sweden.

"Here is the plan proposed by me, and entirely approved of by the Austrian and Prussian Commanders-in-chief. I hope your Royal Highness may find it equally conformable to your ideas. Offensive operations on the part of the Grand Army, between Mentz and Strasburg, offer many difficulties, as we cannot leave the fortresses behind us without observation. By entering France on the side of Switzerland, we meet with incomparably fewer difficulties, that frontier not being so strongly fortified. Another advantage attending this movement, is the possibility of turning the Viceroy's left wing, and thereby forcing him to a precipitate retreat. In that case, the Austrian army of Italy may advance on Lyons, so as to form a prolongation of our line, and by means of its left wing, to connect our operations with those of the Duke of Wellington, whose headquarters are now at Oleron, Soult having retreated to Orthez. In the meantime, Field-marshal Blücher, reinforced by the Bavarians, will form an army of observation of 100,000 men. But, without confining himself to mere observation, he may cross the Rhine near Mannheim, and manœuvre against the enemy till the Grand Army reach the field of action. All the four armies, viz: the Grand Army, that of Italy, Blücher's, and Wellington's, will stand on one line, in the most fertile part

of France. Forming the segment of a circle, the four armies will push forward; and diminishing the arc, will thus draw near its centre, that is, Paris, or to the head-quarters of Napoleon.

"Your highness offered to undertake the conquest of Holland. The proposed operations, which I have submitted to you in detail, will enable you to effect your object the more easily, that they will force Napoleon to oppose the bulk of his troops to our armies on the left of the theatre of war. If your Highness will advance on Cologne and Düsseldorf, or from thence in the direction of Antwerp, you will at once separate Holland from France. In that event, should Napoleon resolve to keep possession of the fortresses, the garrisons left in them will materially diminish the effective strength of his armies. On the other hand, should the garrisons be insufficient for their defence, your Highness will have little difficulty in penetrating into Flanders, and perhaps farther. The grand object is, not to lose a moment, that we may not allow Napoleon time to form and discipline an army, and to furnish it with everything necessary; our business being to take advantage of the disorganized state of his force. I earnestly entreat your Highness not to delay putting your army in motion in furtherance of our general plan of operations."

"The principles laid down in this letter, which, with a few modifications, formed the basis of the campaign, were fully developed by the Commanders-in-Chief, in the orders issued by them to the chiefs of corps, and to the heads of the various branches of administration in the armies.

"The movements of this army made up of the troops of six different powers, were complicated. On entering France it was divided into nine columns. The five first consisted of Austrians who had crossed the Rhine in Switzerland, the sixth of Wirtembergers, the seventh of Bavarians, and the eighth and ninth of a small number of Prussians and Baden-ers. The country to the left of Langres was occupied by the Austrians; that to the right, by the troops of the other five powers. We shall now follow the movements of the columns, beginning at the left wing, and proceeding to the extreme right, commanded by Count W tgenstein.

"The *First Column*, that of Count Bubna, marched through Berne and Neufchatel to Geneva. Having occupied that city, the Count sent detachments into the passes of Mount St. Bernard and the Simplon; and having thus cut off all communication between France and the north of Italy, where the army of the Viceroy was stationed, he advanced to the neighbourhood of Lyons. Owing, however, to the small number of his troops, he did not enter that populous city, but retired behind the Aisne, and remained there during the month of January. The command of the army; destined to assemble at Lyons, was entrusted to Marshal Auge-reau, who was waiting, to begin hostilities,

for the arrival of the troops, which had been ordered to be sent to him from the army of Marshal Soult, then lying on the Spanish frontier. Count Bubna, too, was expecting reinforcements from the Grand Army and from Germany. Thus it happened, that the two armies passed the month of January between Geneva and Lyons, in almost complete inaction. Their operations began in February; and they form the subject of a distinct episode, which we shall give in its proper place.

"The *Second Column*, Count Giulay's, formed the advanced guard of the Grand Army, and advanced to Langres by the great Paris road through Montbéliard and Vésoul. The *Third*, Count Lichtenstein's, formed the blockade of Besançon; and of the *Fourth*, or Count Colloredo's, one division marched on Langres, and took up a position on Giulay's left wing; while the other, leaving a force sufficient to blockade Auxonne, moved forward through Dijon and Châtillon to Tonnerre and Auxerre. The *Fifth*, the Prince of Hesse Homberg's, consisting of all the Austrian reserves, marched on Dijon and Châtillon. The troops of this column, with the exception of the single division of General Bianchi, who advanced to Langres, remained at Dijon during the whole of the month of January. The *Sixth Column*, commanded by the hereditary Prince of Wirtemberg, and the *Seventh* by Count Wrédé, crossed below Huningen and at Basle. The Bavarians formed the blockade of Huningen, Belfort, Breisach, and Shletstadt, and both columns continued their route, the Prince of Wirtemberg through Epinal, Wrédé through Colmar and St. Dié, and took up their quarters between Nancey and Langres. The *Eighth Column*, or that of Barclay de Tolly, who led the corps of the guards, the grenadier corps, and the first corps of cavalry of the reserve, took the direction of Langres, serving as a reinforcement to Count Giulay, the hereditary Prince of Wirtemberg and Count Wrédé.

"Finally, the *Ninth Column*, Count Witgenstein's, on the extremity of the right wing, was destined to advance in the interval between the Grand Army and that of Silesia. The passage of the Rhine, by this column, took up more time than was expected, owing to the quantity of ice in the river. Count Witgenstein was the latest of all in crossing: he passed the river at Fort Louis, below Strasburg, but remained for a considerable time near the Rhine with his infantry, in order to watch the garrisons of Strasburg, Landau, and other fortresses, and thus to secure his advance."

The Austrian effective force was, however, materially diminished by circumstances, and we cannot but notice, in passing, the errors hinted at in their disposition by our author. The portion respecting the celebrated veteran Blucher is lively and interesting.

"In the beginning of January, all the nine columns were in full march in the heart of

France, and on the 4th of that month, Count Giulay occupied Langres; the other corps gradually came up in line with him. We must here, however, remark, that the unconnected movements of the Austrians, their excessive dissemination over the wide extent of country between Langres, Lyons, and Geneva, and the numbers required for blockading the fortresses, and the keeping up of garrisons in the towns in our rear, diminished their numbers to such an extent, that of 130,000 Austrians there remained only 40,000 with the Grand Army in Champagne; in other words, on the scene of action, properly so called. Hence, it follows, that Prince Schwartzemberg had at his immediate disposal not more than 140,000 allied troops; and even from that number there must be deducted 20,000, who were detached and sent to Lyons.

"As the Grand Army advanced, it entered into communication with that of Silesia, which, at the close of the year 1813, was stationed between Coblenz and Darmstadt, where it was destined to cross the Rhine, and then to manœuvre in such a way as to be able, in the event of a battle, to unite with the Grand Army. By a supplementary order, Blucher was instructed, as soon as he should have crossed the Rhine, to blockade Mentz, and without much heeding the other fortresses on the Moselle and Meuse, to push forward, without halting, into the interior of France, so as, by the 15th or 20th January, to join Prince Schwartzemberg, between Arcis, Troyes, and Vitry.

"Blucher's arrangements for the new campaign were the sooner completed, that, from the moment of his arrival on the French frontier from Leipsic, he had never ceased insisting that it was not only inexpedient to stop short, but absolutely necessary to prosecute the war. His two months' stay on the Rhine was more than he could well bear, counting, as he did, every day's delay for a day lost. Burning with the desire of avenging the outraged honour of his country, he could think of nothing but the taking of Paris. When the Emperor Alexander left Frankfort for Basle, Blucher transferred his head-quarters to Hechst, and wishing to divert the attention of the French, on the left bank of the Rhine, from his real purpose, sent abroad reports that the invasion of France would take place on the side of Switzerland, and that he was appointed to pass the winter in Germany, in order to keep up a line of observation. He affected to complain of this imaginary inactivity, and people were the more disposed to believe what he said, that all knew the remarkable openness of his nature: hence, nobody suspected the artifice of the frank old man, who had just completed his seventieth year. He even danced on his birth-day, telling his guests that he must now pass much of his time in merry-making, as he was destined never more to listen to the roar of artillery. He even returned from Hechst to Frankfort, busied himself in providing for the wants of

his army, which he assured every body was to remain in cantonments, and, in the meantime, secretly made the necessary preparations for the passage of the Rhine, which he desired to accomplish on the 20th December, that is, on new-year's-day new style. Writing to one of his relations, he said:— 'At day-break I shall cross the Rhine, but before doing so, I intend, together with my fellow-soldiers, to wash off in the waters of that proud river, every trace of slavery. Then, like free Germans, we will set foot on the frontiers of the great nation, which is now so humble. We shall return as victors, not as vanquished, and our country will hail our arrival with gratitude. How soothing to us will be the moment, when our kinsmen shall meet us with tears of joy!'

We must extract the first passage of the Allies into the "sacred soil" of France.

"During the night of the 19th December, Sacken's corps, along with which was the king of Prussia, assembled at the spot where the Necker falls into the Rhine. On the opposite bank was a redoubt which commanded the mouth of the Necker and the town of Mannheim, and which made it impossible to throw a bridge over the river, while it continued in the enemy's hands. At four o'clock in the morning, a party of Russian light infantry was embarked in boats and on rafts, and was not perceived by the enemy till the boats were within a few yards of the left bank. The French immediately opened a fire of guns and musketry, which was kept up for three-quarters of an hour. Thrice the light infantry unsuccessfully attempted to storm the work, but, in a fourth rush, they succeeded in forcing their way into the redoubt and capturing six guns and three hundred men. The king of Prussia came up to the victors, thanked them, and was greeted with loud hurrahs. All this passed in the profound obscurity of a winter night. The rising sun showed the Russians on French ground and lodged in the enemy's redoubt. Strains of martial music, resounding from all the regiments, now filled the air, and the Rhine was soon covered with vessels transporting the troops. By six o'clock in the evening the pontoon bridge was completed, and the whole corps immediately crossed the river.

"On this very day Field Marshal Blucher, with Langeron and York, crossed the Rhine at Caubé. At two o'clock in the morning, 200 Prussian light infantry were sent down the Rhine in boats, with orders to make fast to the custom-house on the opposite bank, and to make the least possible noise, so as not to give the alarm to the French, who had no suspicion of the intended attack. The troops reached the bank in safety. Here the French attacked the Prussians, but the latter being reinforced by detachments which continued to arrive at short intervals, repulsed the enemy. The Prussian advanced guard took possession of the villages on the bank, and at seven o'clock in the evening,

when the bridge was thrown over, the corps of Langeron and York crossed the river, and turned off to the left on the road to Mentz.

"At the same time Count St. Priest crossed the Rhine at Coblenz, which was occupied by a small detachment of the enemy, defended by a redoubt. In the night of the 19th, the Russian troops were embarked above and below Coblenz. Here too the French had no intimation of their approach, and had hardly time to fire a few shots. The light infantry rushed to the assault, took the redoubt with its four guns, and immediately entered Coblenz, the inhabitants of which illuminated their houses, welcoming the Russians with loud acclamations. In one of the squares the Prefect, on the occupation of Moscow by the French, had erected a monument with the following inscription: '*To the Great Napoleon, in honour of the immortal campaign of 1812.*'

"Colonel Mardenko, who had been appointed Commandant of Coblenz, left the monument untouched, but, under the inscription caused the following words to be engraved:—*Seen and approved by us, Russian Commandant of Coblenz in 1813.*' "

We regret we cannot spare room for the first movements of the enterprising Russian General Czernicheff, the Sir Francis Head of the military field, whose extraordinary personal activity was so singularly successful in conveying intelligence across hundreds of miles in the campaign of 1812, which our readers can scarcely have forgotten, so incredible were they deemed at the time; and who supported his character for determined promptitude throughout his whole career in France. We may, however, cast a glance at the French armies.

"The allied armies, on different sides, penetrated farther and farther into France, meeting nowhere with serious opposition. Before they crossed the frontiers of that country, the enemy's troops were distributed in the following manner. The observation of the Upper Rhine was intrusted to Marshal Victor; the Middle Rhine, from Strasburg to Coblenz, to Marmont; along the Rhine, downwards from Coblenz, lay MacDonald; Ney was at Nancy, and Mortier at Langres. The different corps were quite independent of each other, and received orders directly from Napoleon, who was then in Paris. From this arrangement, it necessarily followed, that the French were nowhere in sufficient force to oppose resistance to the advancing columns, and could not avail themselves of the fortresses and natural obstacles lying on the line of march. Their corps, stationed at five different points, had more of the character of reconnoitering detachments, than of troops destined for the defence of France. Agreeably to the orders of Napoleon, they every where retreated in the direction of Chalons."

The following anecdotes are strongly characteristic of the two sovereigns of whom they are told.

"We cannot resist noticing the different impressions made on Napoleon and Alexander, on receiving the news of the invasion of their respective empires. Napoleon was coming out of his cabinet, on his way to a meeting of the Legislative Assembly, when it was announced to him that the Allies had invaded the frontiers. Preserving his usual firmness, he said, 'If I could have gained two months' delay the enemy would not have crossed the Rhine. This may lead to bad consequences; but alone, I can do nothing; and if unaided, I must fall: then it will be seen that the war is not directed exclusively against me.'—It was at a ball at Vilno, in the house of Count Benningsen, that the general aide-de-camp of the day, Belashéff, informed Alexander of the arrival of an express, with the news that Napoleon had crossed the Niemen. The Emperor ordered Balashéff to keep the news a secret, and remained till the end of the ball, which lasted for an hour longer. Not one of the company suspected that the General's communication was of peculiar importance, and the truth was not known till his Majesty's return to the palace.—Such traits may, on a first view, appear to be of little moment, but they are worthy of being preserved for posterity."

Our memory must serve us but indifferently if the latter part of the following quotation can pass altogether without challenge.

"In the town where the Emperor slept, he received the municipal authorities and notable citizens, and assured them of his protection. By his order, the necessity of kind treatment of the French, and the observance of strict discipline, were inculcated on the troops. Tranquillized by the words of his Majesty, and by the printed proclamations of the commander-in-chief, announcing the pacific intentions of the allied monarchs, the inhabitants of the districts entered by the Grand Army nowhere offered resistance, and readily supplied the bivouacs with provisions, hay, oats and firewood. But as the campaign proceeded, the peasants, in numerous bands, fell on our small detachments. These hostilities of the peasants were at first very rare, and originated not so much in the patriotism of the French, as in the necessity of defending themselves and families from insult, and their property from pillage. Although death was denounced as the punishment of every act of violence, it was impossible to prevent excesses of various kinds, and even acts of cruelty, especially in villages distant from the high road, to which stragglers from regiments, especially Germans, found their way. In this respect, the latter did not imitate their allies the Russians, who left among the French, although they had desecrated our temples, the reputation of exemplary discipline."

The important question of peace or war soon arose amongst the Allies, and was decisively answered by the Emperor Alexander. Upon this and similar passages we reserve our comment for the present.

"On the arrival of the Allied Sovereigns at Langres, when the fourth part of France had been subdued almost without firing a shot, the question arose, whether they should rest satisfied with the advantages they had gained, and consequently make peace with Napoleon, or continue the contest, with the intention, if their arms should be crowned with success, of re-establishing in Europe the order of things as it existed before the Revolution. This proposition was fully developed in the following series of questions which we shall here give in an abridged form.

"Shall the Allies go on and be, as before, guided by the result of military operations alone, or shall they render them subordinate to political considerations? Has the object of the treaty of alliance, concluded at Toplitz last year, been attained, viz. to replace Austria and Prussia in the positions they respectively occupied before the year 1805; to fix the Alps, the Rhine, and the Pyrenees as the boundaries of France; to establish independent states between France and the other powers; and to deprive France of all immediate influence beyond her limits? If the object has not been gained, what means should be employed to accomplish it? Is it not necessary to trace new bases, so as not to fall a sacrifice to that want of precision which has proved fatal to all coalitions hitherto formed? Should Napoleon be deprived of his throne alone, or his family with him? Who is to be raised to the throne? Should the Allies use direct influence in the decision of that question? Should a change of dynasty in France form the object of new efforts on their side; or should they give up the initiative to the French, without offering them either encouragement or opposition? Do the Allies agree to sign a peace, which shall fix the Rhine and the Alps as the boundaries of France? Would it not be necessary to proclaim, that not only the allied powers, but all Europe enters into negotiations with France, and, in the event of delay, publicly to announce the offers made to Napoleon?"

"The allied Cabinets did not all take the same view of the wide, complicated, and important subject on which hung the destiny of Europe in general, and of every state in particular. The arguments in favour of peace, towards which some of them showed a leaning, appeared altogether inconclusive to the Emperor Alexander. The following is the substance of his Majesty's opinion:—

"To stay the operations of the armies for any but military reasons, would be to deprive ourselves of the only decisive means, from the use of which we may expect political advantages. The line of Langres, on which we now are, cannot be called a military one. Langres lies on the road, along

which we must march to meet the enemy and fight with him. The present movements of the allied armies are not the beginning of a new campaign, but the consequences of measures formerly ratified, and of our very invasion of France. It never was in contemplation, that the invasion should be limited to vain attempts. It constitutes a mighty warlike undertaking, having for its object to annihilate the resources of the enemy, to deprive him of the means of forming an army, to weaken his power; in short, to do him all the harm it is possible to do in time of war. I have always insisted on employing our forces in this way, and of keeping our acts in unison with military considerations. It now only remains for us to carry this idea into execution with rapidity and judgment. As long as the war continues, it is impossible to affirm that the object of the coalition has been accomplished: victory must decide that. I have always steadily adhered to this principle, which may now crown our plans with success.

“As long as a considerable part of Europe was occupied by French troops, we were obliged to proportion our demands to the amount of our force, and to express our object in general terms; as, for example,—the re-establishment of Prussia, Austria, and the like. Such expressions do not infer the renunciation of those advantages, which Providence, and our enormous sacrifices allow us to hope for. This truth is established by the example of all wars, and even by our own acts. The conditions of peace which were unofficially discussed at Frankfort, are not those we now desire. At Freiburg we thought of other conditions than we did at Basle; and those which might have been acceptable when we were crossing the Rhine, would not have been accepted at Langres. If it is at all allowable to enlarge our demands, the principle must retain its full force so long as the war continues. The measure of its accomplishment will be regulated by prudence and state reasons; for no previous agreement between the Allies is, in the slightest degree binding on them, in relation to the enemy. We have enlarged our demands in proportion to our success; and this, of itself, proves how necessary for us it is to increase the number of the latter, that we may gain our ends with the greater certainty. A few days are not sufficient to convince us of this: and therefore, we should not, by a hurried pacification, enable the enemy to escape from his present dangerous position.

“The Allies are unanimously agreed in this, that they have no right to canvass the opinion of the French on the subject of a ruling dynasty; and still less to oppose it, whatever it may be. We are not waging war for that object; consequently it cannot become the subject of deliberation. The Allies have no desire to take such advantage of victory, as to compel the French to express that opinion; and our glory will be the great-

er, if, with the power in our hands, we show ourselves devoid of partiality.

“We have now to agree as to the conditions on which peace should be offered to France; it being fully understood, that we reserve the right of increasing our demands, by availing ourselves of whatever success we may obtain during the course of the negotiations. I was the first to declare, that we should treat with France in the name of all Europe; and I agree that she should be allowed no voice in the fixing of frontiers, or in any arrangements whatever between the other Powers; though their nature may be communicated to her for the sake of information. All negotiations with her must relate exclusively to her future limits. If the negotiations should be spun out by delays, or should not be brought to the desired conclusion, I shall then consider it as a duty to publish to France and to Europe the conditions which were offered.

“In conclusion, I must direct the attention of the Allies to the forces of the enemy, and to the necessity of crushing them, equally during the course of the negotiations, as in the event of all hope of peace having vanished. Napoleon's weakness consists in the disorder which reigns among the greater part of his troops, and in the inexperience of his new levied recruits, who are strangers to discipline. These are the consequences of the defeats he has sustained; since which, he has not had time to re-organize his armies; but his condition is daily improving; and if we continue to delay, we shall give our enemy the means of effacing every trace of his present embarrassments.

“Let us even suppose a treaty of peace to be concluded. To carry its various stipulations into effect, would require much time. How many provinces, how many fortresses, from Mantua to the Texel, would the enemy have to deliver up, and we to receive! If, in the meantime, Napoleon were to recover his strength, and to avail himself of a thousand circumstances which might give rise to fresh discussion on so complex a subject, who can assure us that he would not tear the treaty in pieces, the instant he had caught a glimpse of success? The only security against such danger, is to be found in the destruction of the armies he is collecting, and in rendering it impossible for him to levy fresh troops. All this has no relation to a change of dynasty; but, if Providence should turn circumstances, and even Napoleon himself, into engines for the destruction of his political existence, it would neither be contrary to justice, nor to the interests of Europe.”

Negotiations simultaneously with hostilities being thus resolved on, and Caulaincourt having been waiting at the advanced posts of the Allies three weeks for a passport,

“For the purpose of drawing up definite instructions for the guidance of the Congress, a council was held on the 16th January, at

which the following persons were present: on the part of Russia, Counts Razumòfsky and Nesselrode; on that of Austria, Prince Metternich and Count Stadion; on that of Prussia, Prince Hardenberg; England was represented by her minister for foreign affairs, Lord Castlereagh, who had just arrived from London.

"It was proposed to the council, as the sum of their deliberations,—

"1st. To enter into negotiations with Napoleon. 2d. To act in the name of Europe. 3d. To leave France those territories only which belonged to her before the war of 1792. 4th. If Napoleon should desire it, to give him a superficial idea, avoiding details, of the intentions of the Allied Sovereigns with respect to the ultimate territorial arrangement of Europe. 5th. To furnish the plenipotentiaries with instructions of one and the same import; and 6th. In the event of the negotiations not leading to the desired end, to announce this to the French nation.

"When the Allied Sovereigns had given their sanction to these articles, the following plenipotentiaries were appointed to the Congress which was destined to be held at Châtillon on the Seine: on our part, Count Razumòfsky; on that of Austria, Count Stadion; on that of Prussia, Baron Humboldt; and on that of England, Lords Cathcart, Aberdeen, and General Stewart.

"The instructions given to the plenipotentiaries were,—that they should negotiate on behalf of all Europe, and not in the name of the four Powers alone, by whom they were commissioned; the latter pledging themselves that the other States, who were not represented at the Congress, should adhere to its acts. The plenipotentiaries were desired to confine themselves to two objects only. In the first place, to the future boundaries of France; and in the second, to the general arrangement of the affairs of Europe. With respect to the first article, it was proposed to Napoleon, that he should give up all the conquests made by France since the year 1792. As to the second, he was required, 1st, to acknowledge the independence of Germany, Switzerland, Italy, and Holland; which last, with some additions of territory, was to belong to the house of Orange; 2dly, to restore the Spanish sceptre to Ferdinand VII.; 3dly, to deliver over, within a given time, the fortresses in the countries which had been conquered by France; Mentz, for instance, within eight days after the signing of peace, and Luxembourg, Antwerp, Bergen-op-Zoom, Mantua, Peschiera, Palma-Nova, and Venice, within ten days:—to put into the hands of the Allies, within four days, the three fortresses of Bèfort, Bésançon and Huningen, to be kept by them in the nature of pledges, till the complete fulfilment of all the stipulations in the treaty of peace. 4thly. To renounce the titles of King of Italy and Protector of the Rhenish and Swiss Confederations. In return for all which sacrifices, England agreed to restore the colonies she had conquered during the war.

"Although the plenipotentiaries received the same instructions, it did not follow that all the cabinets were alike desirous to bring the war to a close. Some, who were exhausted by the campaign and by the sacrifices connected with it, considered peace as indispensable; but the Emperor Alexander looked at events in another point of view. On sending Count Razumòfsky to the Congress, he desired him to be in no hurry to act, and on no account to sign any thing without an express order to that effect. The plenipotentiary acted conformably to the will of his Sovereign, and during the sitting of the Congress received repeated assurances of his Majesty's approbation of his prudent circumspection."—p. 45—47.

We are now directed to the movements of Napoleon, and in this crisis of his fortune it is singular to notice a wholly novel expedient, on the part of Napoleon himself at least, for ensuring success.

"It was during the Emperor Alexander's stay at Langres that Napoleon quitted Paris for the army. He had put off his departure from day to day, waiting for the arrival of troops from Spain, and for the results of his exertions in the formation and equipment of armies: but receiving daily reports of the rapid advance of the Allies into the heart of France, it was impossible for him to remain longer in Paris, and he therefore resolved to open the campaign, though his preparations for war were not yet completed. He invested his consort with the regency of the empire, and entrusted the military command of Paris to his brother Joseph. On leaving the capital he gave orders, *for the first time since he had mounted the throne*, that prayers should be read in all the churches for the success of his arms."—p. 49.

This certainly was a mournful extremity to be reduced to; an extreme measure necessitated upon the restorer of the Gallican Church: not simply as ominous of the French Emperor's diminished confidence in his star, but also as a proof that Napoleon now for the first time felt he had too long disregarded the popular feelings in France. He lost, however, none of his former activity; entering Chalons on the evening of the 14th January, he stayed there but twelve hours and moved to Vitry, and thence the next day fell on Lanskoi's detachment at St. Dizier: thus cutting off the communication between Blucher and Yorck, and intending to assail the former. Blucher, deceived by the movement, fancied it a mere reconnoissance, and might have suffered far more severely than he actually did, had not Prince Schwartzenburg taken the alarm in time, and sent troops to his assistance. This brought on the battle of Brienne, which we shall extract at some length.

"Napoleon having marched from St. Di-

zier through Montierand, reached Mézières at two o'clock in the afternoon. He instantly attacked Count Pahlen, who was standing between that town, Lassicour, and Brienne, and keeping possession of the great road, which it was necessary for us to retain in our hands at any cost, in order to give Sacken time to come up from Lesmont and pass through Brienne, then occupied by Olsoofief. The onset grew brisker every minute. The French balls already began to pass over the advanced guard, and to fall among Sacken's columns which had arrived from the banks of the Aube. Napoleon could not bring his whole forces at once into line, as a great part of them had not yet had time to reach the field of action; but by degrees, as they came up, the affair became serious. Olsoofief's guns, which Blucher had placed under the orders of Nikétin, who was in command of the artillery of Sacken's corps, were brought out of the town by that officer, and placed in battery. A regiment of light infantry threw out skirmishers; the other regiments stood in close columns, covered by the streets and gardens, and the great road was thus entirely cleared for Sacken's passage through Brienne. Having passed through the town, he formed in the reserve, and Count Pahlen gradually retired, not being in a condition, with his small detachment, to keep the increasing forces of the enemy at bay. Besides, he had attained his object, which was to gain time for the infantry to arrive and to take up their appointed ground. He placed the cavalry on the right flank, uncovered the town, and cleared the way for the artillery which now began to play.

"The enemy showered shells on the town, and instantly set it on fire. Necessity compelled Napoleon to reduce to ashes the place where he was educated, and where he had spent the happy days of his boyhood. Part of his infantry charged the fifteenth company of artillery and took several guns, and his dragoons dashed into Brienne in the midst of the spreading flames, the bursting of grenades, and the crash of falling tiles. Nikétin, on receiving an order from Sacken to increase his fire, placed twenty-four guns against the enemy's left flank, which forced them to retreat, and to abandon the guns they had taken from our 15th company. At the same time, Count Pahlen, though not belonging to the army of Silesia, yet as the oldest General of cavalry, took the command of all the horse, charged the left wing of the French and took eight guns. The town remained in our hands, and the combat gradually slackened."—pp. 54, 55.

The confidence of Blucher now exposed him to considerable danger.

"Considering the battle to be ended, Field Marshal Blucher retired to pass the night in the castle of Brienne, which is situated on a neighbouring eminence, and the officers of his staff parted to seek shelter for the night. All at once a fire of musketry was heard, and crowds of the enemy who had stolen

through the park, broke into the castle with loud shouts and cries. At this moment the Field Marshal was in the top story looking at the line of fires which the enemy were kindling in front of their bivouacs. He hastened down stairs and set off towards the town, but was soon met by a Cossack, who informed him that the French had forced their way into Brienne. By the light of the flames of the burning houses, Blucher could plainly distinguish the enemy's horse coming straight up to him at a trot. He turned aside into a cross road, and as he continued to go at a walk, the chief of his staff, General Gneisenau, said to him, 'Can it be your wish to be carried in triumph to Paris?' The Field Marshal then put spurs to his horse, and happily reached his troops. Several French squadrons had approached the town unperceived, and finding that our people had neglected to place guards at the entrances, charged along the street where Sacken was then giving orders. He backed his horse against a house which stood near him, and coolly waited till the enemy had passed by without recognizing, in their hurry, him who, but two months afterwards, was Governor General of Paris.

"After this alarm, the Field Marshal ordered the castle to be attacked and the town to be entirely cleared of the enemy, who had established themselves in some houses in the suburbs. Olsoofief advanced twice to the assault of the castle, not only without success, but with heavy loss, owing to the enemy being protected by the darkness, while our columns and sharpshooters advancing in the full glare of the burning edifices, presented a mark which it was almost impossible to miss. The French kept possession of the castle, as did Sacken of the town, in which he passed the night. At two o'clock in the morning he received orders to retire to the position at Trannes on the road to Bar-sur-Aube, where the Grand Army now was.

"Thus ended Napoleon's first affair in France, at which, on the side of the Allies, there were none but Russian troops present."—p. 55—57.

"The defence of the Russians was desperate. They had not entered France to yield up their renown, in the outset of the campaign, to an enemy over whom they had triumphed for two years together."—p. 57.

The author strongly criticises the general conduct of Napoleon throughout this last campaign, fatal as it was to his power, but very far from such, we believe, to his reputation as a military commander in the opinions of the ablest judges. There is, however, nothing more easy than to find fault with a plan of operations, after the event, and particularly in ignorance, such as must necessarily exist, of the real means actually possessed by an antagonist, and of his secret views in the course he proposes to himself. The "glorious successes" re-

ferred to by Sir Robert Wilson, and "movements that deserved an empire" on the part of Napoleon, are grievously depreciated by M. Danilefsky. Of course we cannot presume to offer an opinion on the matter, but must confess that our previous judgment is by no means altered by the remarks of the gallant author before us. We give the passage however.

"Napoleon had two means in his power of gaining a decided superiority. The first was to assemble all his forces at Sommevoir after occupying St. Dizier, and, without halting, to march straight on Colombé, and Bar-sur-Aube, there to attack Count Giulay, and the hereditary Prince of Wirtemberg, and driving them before him to Bar-sur-Seine, at one and the same time separate Blucher from Schwartzberg, who would have been obliged, with all haste, to assemble his different corps at Langres, and probably in the rear of that town. Napoleon might then have turned on Blucher and beat him; for he was much the stronger of the two, and Blucher would not have disputed the ground with the obstinacy he displayed at Brienne, where a safe retreat was always open to him, but would have been compelled to think only of saving his army. The second plan, which would have afforded a reasonable hope of victory, was the following:—If Napoleon had the defeat of Blucher singly in view, then, instead of keeping away to the right, it seems evident that he should have marched from Sommevoir on Dienville, that is, on Blucher's communications with Prince Schwartzberg, and have attacked him in the rear. Napoleon did not follow either of these plans; and the useless bloodshed of the 17th January, which gave him but a momentary possession of the field of battle, was productive of positive injury to him, as it led to the concentration of the allied forces.

"It may further be added that Napoleon, who in all his previous wars had displayed consummate skill in commencing operations, did not on the present occasion act up to his reputation, but opened the campaign unseasonably. Let us suppose that it did enter into his plans to defend the Rhine, and to hinder the Allies from entering France: but when they had once advanced over a great extent of country, why did he not act on their communications? If he had undertaken his forward movement four days later, when the rear of our columns would not have been far from Troyes, and then pushed on from Chalons, through Joinville and Chaumont, he would have stood on the communications of the Grand Army, and would himself have been leaning on Metz, Verdun, and other fortresses. In such circumstances Prince Schwartzberg must undoubtedly have retreated. The solidity of this remark is so far justified by Napoleon's resorting at the end of the campaign to the manœuvre we have now described; but it was made too

late to be attended with success; for his means were not then so considerable as they were in the beginning of the war. Besides, political circumstances had by that time so far ripened, that a single bold step of the Allies sufficed to overthrow the edifice of his power."

After the affair at Brienne, we learn that "Napoleon's inactivity during the two days consumed in effecting the junction of the two armies, appeared so utterly incredible that the Emperor Alexander sent several times to inquire if he actually remained in the position he had taken up. Once only, a pretty considerable body of French troops marched from Brienne to Lesmont, but returned again to their position. We may be allowed to conclude that Napoleon had been meditating some plan which he did not carry into execution. It has been asserted that his inactivity was caused by false intelligence of the Grand Army being on the march to Auxerre, and that he spent these two days at Brienne with the intention of waiting the completion of this movement, in order to fall separately upon one or other of the allied armies."

We must recall to our readers the constant doubt and uneasiness that affected the general mind in England at the epoch we are considering, from the apparent delays and indecision of the Grand Army after its successes. It was clearly not actuated by the spirit that influenced the Prussian force under Blucher, and that had made the Silesian army in 1813 the wonder of the Allies. M. Danilefsky throws great blame on the Germans, and especially on the Austrians and their commander, for tardiness of movement, delays, and the absence of common activity in pursuit. He states that after the affairs of Lesmont and Rosnay a whole day was lost, and Napoleon had time to gain a march on the Allies. The advanced guard of Austrians, Wirtembergers, and Bavarians, so tardily pursued their beaten enemy, that they at last fairly lost sight of him. Two days actually elapsed before Prince Schwartzberg knew whether the French had taken the road to Troyes, Arcis, or Chalons. In order to obtain certain information of the enemy's motions, the Emperor sent forward the light cavalry division of the guards, under the General Aide-de-Camp Count Ojaroffsky, who reported that the corps of Mortier alone was drawing off towards Arcis, and that Napoleon, with his whole forces, had marched through Piney in the direction of Troyes. This report did not convince the Field Marshal, who waited for its confirmation; and thus it was not before he had received a second report from Count Ojaroffsky, of the same tenor with the first, that he gave orders to continue the advance.

"Prince Schwartzberg thought that Napoleon would defend himself in Troyes; drawing this conclusion from the circumstance of the French having surrounded the town with new palisades. Napoleon, however, did not halt at Troyes, but retired on Nogent, of which a report was immediately sent in by the partizan Soslavin. Again the Prince refused to give credit to this important intelligence, and ordered, for the 25th, a general reconnoissance of the enemy who were posted around Troyes; thus another day was lost. Even this order was recalled, and instead of the proposed movements, the Field Marshal resolved, on the 26th January, with all his forces to attack the French by both banks of the Seine, at Troyes, where there was now but a slender rear-guard unmolested by any body. For this purpose, instructions, of three pages in length, were drawn up in the Austrian camp, ordering, among other things, that the troops should provide themselves with ladders and fascines."

And again we find it stated that

"The Emperor, who was at Bar-sur-Seine, had intended leaving that town in order to be present at the proposed attack. At eleven o'clock in the morning his Majesty's charger was at the door, when he received intelligence confirming Soslavin's report that Napoleon had evacuated the town the evening before, that is, on the 25th. The service of the advanced posts had been so carelessly performed by the Germans, that the first news Prince Schwartzberg received of Napoleon's retreat from Troyes, was not from his advanced troops, but from deserters."

It is, however, but fair to recollect that there are times and occasions when the greatest commanders have been foiled in the very way first alluded to, and this from no want of energy or activity in the victor. We need only refer to the case of the Russian army upon its retreat from Borodino, when the movements of Kutusov were so thoroughly veiled from the eyes of Napoleon for two entire days, that he was totally ignorant of their position: and on the other hand the French army in its retreat upon the Beresina was more than once lost for a time to the pursuers. There was, however, much of this inaction originated by the personal character of the Emperor Francis. It cannot be forgotten that the inactivity following the great battle of Aspern in 1809, and when Prince John de Lichtenstein offered to cross the Danube with 40,000 cavalry to complete the discomfiture of the French, was produced by the extreme reluctance of the Austrian Emperor to suffer a greater effusion of blood, and his mistaken but amiable confidence in the certainty of a peace to be obtained by the mere manœuvres of his approaching armies against the dispirited French. The battle of Wagram opened his eyes too late.

In the same manner we must recollect

that the wife of the French Emperor was the daughter of Francis, and that this mild and humane prince was far from desiring either the deposition of his son-in-law, or the destruction of his daughter's subjects and kingdom. But if these are not sufficient to exonerate the Austrian Field Marshal from the charge of supineness, we must further recall the total absence of explanations on his part, these being of course out of the question; and our consequent ignorance therefore of possible causes that might excuse, vindicate, or even necessitate delay. The severe checks experienced so often by the Austrians on the field of battle could not be without their due effect upon their leader generally: and the vast responsibility imposed by his station, as Commander-in-Chief of the whole armies of the Allies, and the dangers to which a single false movement, or even one defeat in detail, such as Blücher's at Montmirail, sufficiently disastrous to the cause, though the Prussian army was subordinate to his own, might expose the interests intrusted to his care, and even the personal safety of the sovereigns, his own monarch included, all tend to make us hesitate in adopting the views of M. Danilefsky, which probably were those of his Emperor also. And we are induced to the greater caution on this head from the unquestionable fact that Alexander had been an eager candidate for the chief command; and that the Emperor Francis had insisted upon retaining it for his own general, since it was his troops that raised the sinking scale of the Allies against the might of Napoleon in 1813; a fact which, if M. Danilefsky had known, and he could scarcely, we think, have been ignorant of it, might have induced him to hesitate at asserting, as we have seen he does, that the Emperor Alexander was acknowledged *THE* Liberator of Europe.

The battle of Brienne gave Paris to the Allies, according to M. Danilefsky, though we question whether there were not in the course of the campaign moments that rendered the gift somewhat precarious.

"The Allies did not all share the Emperor Alexander's confident anticipation of speedily getting possession of Paris. This result, indeed, still depended on the chances of war, as to which each of them drew conclusions according to his conviction, and to his confidence in his own force. Their chief dread was, that on the taking of Paris, they should meet with innumerable difficulties in the administration of a populous capital. They could find no answer to the question: 'What shall we do with it when we have it?' The very idea of the subjugation of Paris wrought upon their imagination, by its vastness and

novelty, to such a degree, that the now probable invasion of that capital, instead of exciting them to make a grand effort to crown their former victories, to reap the fruits of their sacrifices, to wipe out the stains of many defeats, and to realize that hope in which Europe was waiting the decision of her fate,—was considered by them as an additional motive to a speedy conclusion of peace. Alexander thought otherwise than did his Allies, and regarded the taking of Paris as a circumstance which could not be accompanied with any difficulties of a peculiar kind. In this respect the result justified his sagacity; but in January few were of his opinion."

It is, nevertheless, not very unreasonable to suppose both that the Emperor Alexander's own desire to play the conqueror was "the wish that was father to the thought;" and also that it was the protraction of the campaign, the camp giving the secret enemies of Napoleon time to mature their schemes and increasing the distaste for war in their own territory, that actuated the Parisians so strongly in a later stage of the campaign; and this might certainly not have been the case, had the attempt on the capital been earlier made.

While Austria, England, and, despite of Blucher, Prussia, were disposed to make peace at Chatillon, the Russian Emperor persisted in the necessity of continuing the war; the former were strengthened in their desires by the disasters of the Silesian army, when Blucher, in spite of his own characteristic activity, utterly ignorant and unsuspecting of Napoleon's, committed the fatal error of dividing his forces too widely, and was beaten severely in detail by the army under the latter, at Champaubert, Etoges, and Montmirail. The Russian general, Olsoofief, was made prisoner at the first-named place.

"Napoleon desiring to see Olsoofief, invited him to sup with him; but as the general had difficulty in expressing himself in the French language, Napoleon sent for Poltoratsky. The following dialogue took place between them.

"How many were you in the field to-day?"

"3690 men, and 24 guns."

"Nonsense! that cannot be; you had, at least, 18,000 men."

"A Russian officer does not speak nonsense. I have told the truth; besides, there are other persons from whom you can learn the same thing; then I hope you will be convinced that Russians do not lie."

"Napoleon scowled, and after a short silence said, 'If what you assert be true, it may be said to your honour, that Russians alone can fight so desperately. I would

have pledged my head that you were, at least, 18,000.

"For all that I am a prisoner."

"What does that signify? Your Emperor has fifty of my generals prisoners, and as good as you. But, granting that I have destroyed you without great honour, as my troops fought with yours a whole day, still the consequences of this affair are important to me; and I will now tell you, that, as I have routed you to-day, I will annihilate Sacken to-morrow; on Thursday, the whole of Witgenstein's advanced guard; on Friday, I will give Blucher a blow from which he will not recover, and then I hope to dictate a peace to your Alexander on the Vistula."

"That will be rather difficult."

"Napoleon then entered critically on the subject of the late campaigns, and after running over that of 1812, ended by saying, 'Your old fox, Kutusof, deceived me by his march on our flank.' He carried his playful humour so far, that Poltoratsky now and then disputed with him, and among other things said, that the French had burned Moscow. This expression seemed unpleasant to Napoleon: 'What! the French? That act of barbarity was the work of you Russians.'

"When you took possession of Moscow, and when all order was at an end, it may be said that both the French and the Russians burned it: but I must frankly tell you that Russians, so far from regretting the catastrophe, reflect with pride on the burning of their ancient capital and can soon build a new one."

"Napoleon continued to grow warmer, and said, 'It was a barbarous deed, and a stain on the nation; I took Berlin, Madrid, and Vienna, and no such thing happened.'

"The Russians don't repent of it, and are delighted with the results."

"Napoleon stamped with his foot, and ordered the prisoner to leave the room."

"During the dialogue Marshals Berthier, Ney, Marmont, and the minister of foreign affairs, Maret, stood by in the most respectful posture. Poltoratsky was making his way, accompanied by a colonel of *gens-d'armes*, through the bivouac of the guard which encircled the house occupied by Napoleon, when he heard somebody call out, 'Where is the Russian prisoner?' It was the French General-aide-de-camp Fiahaut. He very politely requested him to return to Napoleon, who, loading his prisoner with compliments, thus began his interrogatory:

"What is the strength of the Russian guards and army? Where is the Emperor and generals?" naming many of them.

"To all his questions he received one and the same answer: 'I don't know.'"

"I had promised myself the pleasure," continued Napoleon, 'of conversing with you on several matters, but your answer, "I don't know," hinders me. Why does your Emperor every where employ his own excellent troops, and not the Germans, whom

I could annihilate in half an hour, while I have been fighting with you for a whole day ?

“ You ask me about the position of our army : that is a secret. To us the will of the Emperor is sacred, send us where he may. A gallant soldier says everything that comes uppermost. Our oath to our Emperor and country forbids that.”

“ Here Napoleon, displaying an intercepted order from Blücher to Olsoffief, desiring him on no account to retire from Champaubert, exclaimed, ‘ There is your drunkard Blücher ! Did he know I was here ? Where I am, there are a hundred thousand more.’ Poltoratsky still continuing his answers in the negative on the state of the army, was for the second time sent out of the room. Napoleon ordered him to be conveyed to Paris, and to be strictly watched.”

We extract a passage relative to the influence of Napoleon’s presence. The same, however, might have been said of that singularly gallant warrior, Lasnes, not only courageous himself but the cause of courage in others.

“ They who never witnessed a combat which Napoleon personally commanded and directed, can have but a faint idea of the magical effect produced by his presence on the spirit of a fight. The moment he appeared, the cavalry attacked with greater boldness and rapidity,—the skirmishers fell back, and gave place to deep columns of infantry,—the batteries were reinforced, and the fire became heavier,—Aides-de-camp galloped about in all directions,—and the air resounded with the cries of ‘ En avant ! Vive l’Empereur ! ’ ”

We often read of the kind of mental paralysis to which Napoleon was subject when his favourite objects were at any time frustrated by severe defeat. The same, more than once in the volume before us, as the reader will find, appears to have been the case with Blücher also, and is, in truth, not unusual with all men of sanguine temperament after sudden and complete disappointment of a favourite scheme. The following anecdote of the Prussian Field-Marshal on this occasion recalls Charles I. at Naseby.

“ Total defeat now appeared to Blücher to be inevitable. His mighty heart shuddered at the thought, that not only himself but Prince Augustus and the whole corps were on the point of being made prisoners. He now sought death, and stood in front of the squares in the thickest of the fire. ‘ If you should be killed here,’ said his favourite aide-de-camp, Nostitz, to him : ‘ do you really suppose that history will praise you for it ? ’ The Field Marshal now turned his horse’s head, and seeing the chief of his staff, Gneisenau, said to him, ‘ If I do not perish to-day, then am I destined to live long : I still hope to be able to repair all.’ ”

To readers in general, and more especially military men, we strongly recommend this volume, as a plain, clear, and soldier-like narrative, authentic in its views and statements, and satisfactory and interesting in its details. Much of the information it contains cannot, for the reasons we assigned in the outset of this article, be obtained with the same precision from any other sources : read with the work of Van Ense, and Lord Londonderry’s narrative, it forms a third volume of equal official value. The work too is from its nature a rarity, as one of the first instances of anything approaching to political subjects being printed in Petersburg :—a fact that speaks highly for the liberality of the Emperor Nicholas.

We mean speedily to return to the subject of the campaign of 1813 and 1814, and of the characters that distinguished themselves in war and diplomacy at that period. But we cannot lay down the pen without a protest against M. Danilefsky’s intimation that the minister of England stood rebuked before his Emperor, and that the plan of the campaign was that monarch’s unassisted work ; for such his book implies.

The British minister’s object was to serve his own country first, and carry his Cabinet’s resolves into effect. The deposition of Napoleon was of different importance to the interests of the different Allied Powers, though not perhaps to their feelings ; and the English secretary, we happen to know, had stood more than once before his own and other sovereigns in displeasure, as courteous and calm, but as inflexible, as he certainly proved on like occasions to Alexander. For the merits of the campaign we may recall Moreau and Jomini for France ; Blücher and still more Gneisenau for Prussia ; Austria has spoken for herself. England has more claims on our notice. Her commissioners were selected for their peculiar qualities ;—Cathcart, cool and decided ; Wilson, active, ardent, and enterprising to a fault. Lowe, a finished soldier and writer ; a man of details,—whose genius embraced and elucidated all : who could judge to a nicety every minutiae, and the bearing of each upon the general scheme. Finally, Stewart, who divided with the Earl of Uxbridge himself the suffrages of his nation as a cavalry officer : less impetuous, but full as determined and daring ; as simple in outlines of service as Lowe was complicated ; with an intrepidity that was never shaken nor surprised, and a military conduct that had never failed in the execution of any service entrusted to him. With all these men, and they were repeatedly consulted, Alexander must be satisfied to share the glories claimed for him.

ART. VII.—*Proclamation of the Governor-General of India.*—Calcutta, 1838.

THE publication, since the appearance of our last Number, of the Parliamentary papers relative to the great Eastern question and the conduct of Russia especially, both as regards her conjunction with Persia and the course she has pursued towards Great Britain in consequence, seems to have taken the British public altogether by surprise. No one fixed, general opinion appears to prevail, either as regards the rights of the question between Persia and Affghanistan, which is little understood, or the degree of faith to be placed now and hereafter in the professions, as separate from the practices, of the Court of St. Petersburg. This point is even less intelligible than the former; and with good reason; for loudly as the public press of this country had called the attention of the British government to the covert proceedings of Russian intrigue; and positively as they and the nation had been assured, from the best authority, that there was no reason whatever for any apprehension on the subject, no one beyond the mysterious pale of that improved diplomacy which, like all other blessings of recent reform, pursues its simple and straightforward course by increasing mystifications and multiplying complexity, could for a moment have entertained a suspicion that the truth of their conjectures lay very near the surface, and required some dexterity to shroud it effectually from their sight. That such has been the case is now unquestionable; and the Parliamentary correspondence alluded to in the outset will satisfy any reader on this point, though it is little satisfactory on any other.

It is not our intention to deal in large quotations from the mass of developments these papers present; yet much may be necessary. But when so many as fifty-seven printed sheets afford irrefragable evidence of craft, ambition, and deceit in the conduct of the agents of a great European power towards a nation with which its government professes the strongest desire to cultivate the relations of peace and amity, since all this manœuvring has been exerted upon a single one, out of several, the uninitiated may be tempted to ask, what security is there on any other head?

To this but one answer can present itself: viz. that there is no security whatever from without; and that the best from within can be found only in the jealousy of the British nation henceforth, and in the vigilance of its ministers against Russian intrigue.

Although politically opposed to the pre-

sent ministry, and doubting, in our ignorance, both the wisdom and the candour of steadily denying facts so obvious and undeniable (we should have imagined,) as that of exposed Russian intrigues, we are bound to give the Right Hon. Secretary for Foreign Affairs every credit for the steps he has taken to obtain explanations. That these steps have checked the course of those intrigues, by bringing them before the eyes of rulers and of nations in a manner and with a distinctness that admitted neither subterfuge nor palliation, is a proof that the guardian of the country has not been negligent of her interest and his own duties. That the explanations in question have been satisfactory to the British government we are extremely glad to hear: and should have been still more glad to feel that they had satisfied any one else.

From the pains taken in our last notice of the subject to show the antagonisms existing between the different constituent portions of the Russian nation and government, our readers will not have been surprised to find that the system of counteraction there has been called into full activity; and they will therefore the more readily understand the difficulties entailed, first, on that sovereign as respects his ministers; and next, upon the British government, which is compelled to treat with the two as a single power.

Modern history affords examples enough, and we have recently instanced a very particular case, in the reign of George II., that the disavowal by a sovereign of the acts of his ministers is a sufficient atonement to a foreign power—for attempts against its peace, its possessions, and independence. This then is a precedent which cannot be departed from in the case before us. The English ministers are bound to abide by it, so long as no absolute deceit is apparent in the conduct of the party recanting. The course pursued by Nicholas towards the parties engaged in the nefarious intrigue may or may not be satisfactory to the aggrieved; but so long as the individuals transgressing are not openly countenanced by their monarch, but on the contrary stand virtually, if not actually, reprimanded and disgraced, England must acquiesce in the reparation offered; though she retains the right to consider the past as a matter of grievance if the future should in any shape correspond with it.

Since, then, the vigilance of the English minister is alarmed, and a tangible ground for jealousy obtained, it is clear that we have a right to view with suspicion any proceeding that tends to strengthen the latter, and to hold ourselves prepared to support the form-

er, should any necessity arise from the complexion of circumstances present or future.

The considerations on this head consequently reduce themselves to this: that we have taken the least apology that could be offered, because we were bound by precedents, and the spirit of the law of nations, to be satisfied with it: but that we are bound by the far stronger law of self-preservation to watch narrowly the sequel, and by every means prevent it from doing us farther injury.

But in order to do both with effect it is necessary to examine in some little detail the facts of the past as well as of the present: and for the former at least there exists the greater necessity, since it involves two points, essentially distinct, but which by their conjunction have materially complicated the question, and effectually militated against a just apprehension of it: producing the difficulty of comprehension to which we alluded at the outset of this article.

The first point is; whether Persia was justifiable or not in the invasion of Afghanistan? This question includes the right and mode of British interference.

The second point is, how far Russia was justifiable in the course pursued by her agents.

For the last century at least, Khorassan has not formed an integral part of the Persian empire, but remained generally faithful to the House of its conqueror, Nadir Shah, though his dynasty had been superseded in Persia itself by the Kajar or the Zend. There was, however, a claim of subjection on the part of Persia, and this was acknowledged by occasional payments of money from the ruler of Herat; chiefly effected, it is true, through the instrumentality of force, strictly according with Asiatic precedent.

These pecuniary supplies might not, certainly, be sufficient in themselves to establish the existence of subjection, inasmuch as they were made only with the greatest reluctance; a feeling nowhere unusual under such or any other circumstances: nevertheless it cannot be qualified otherwise than as a tribute, from the simple fact, which we divest of immaterial accompaniments; viz. that after bearing the simple title of Meerza, or Prince, like his predecessors, it was only in 1837, that the ruler of Herat—and this, be it observed, in no extremity of danger—offered to pay a yearly tribute to the Shah, and assist him with troops, as a vassal, with other conditions not bearing immediately on this head, if only the Shah of Persia would recognize his independence beyond these points: that is, by admitting him, Kamran, to the style and title of Shah and abstaining

from interference with his government: and this proposition was made through the British minister, Mr. (now Sir John) MacNeill.

The question of rights thus simply disposed of, by the admission of the party chiefly concerned, we now only instance, in proof of our assertion on a former occasion upon the subject (F.Q.R. 43), that Persia was the party aggrieved, the fact that Kamran had taken advantage of the disorders in that kingdom on the death of the late Shah to enter it and carry off twelve thousand persons whom he sold for slaves, at the same time compelling the chief of Khain, the Shah's subject, to pay tribute. We give the extracts establishing these two points, from Mr. Ellis's letter.

"Tehran, April 17, 1836.

"I had an audience of the Shah this day.

"His Majesty observed that the strongest considerations of duty, both as a king and a Mussulman, required him to proceed himself to Khorassan; that Kamran Meerza, and the Affghans under his authority, had penetrated from Seistan into Khorassan, had carried away twelve thousand persons, whom they had sold as slaves, and had compelled the Chief of Khain, his subject, to send tribute to Kamran Meerza; that the Chiefs of Khain and Khaf, both towns in Khorassan, had sent agents to say, that they must, unless immediately supported by the Shah, submit to Kamran; and that under these circumstances, he was bound to postpone all other objects. I observed that however pressing these considerations might be, the chastisement of the Affghans and Turcomans might be effected by his Majesty's servants, while the settlement of the revenue in the other provinces could never be so efficaciously made as by himself in person."

The right of the Shah to avenge his own cause against his vassal is undeniable; and our second extract will show that such was the view taken by Mr. MacNeill as well as by his predecessor Mr. Ellis.

"Tehran, February 24, 1837.

"I have the honour to transmit a copy of a letter I have just received from the Government of India. I hope that it will be unnecessary for me to have recourse to the measures proposed by the Governor-General for the purpose of marking the friendly feelings of the British Government towards the Affghans; for I hope that the Shah will not undertake an expedition against Herat this year; but were it otherwise, I very much fear that any remonstrances I could offer would be insufficient to deter the Shah from prosecuting what he regards as a just war.

"Putting aside the claims of Persia to the sovereignty of Herat, and regarding the question as one between two independ-

ent sovereigns, I am inclined to believe that the Government of Herat will be found to have been the aggressor.

"On the death of Abbas Meerza, when the present Shah returned from his unsuccessful expedition against Herat, negotiations were entered into which terminated in the conclusion of an agreement for the cessation of hostilities between the parties, and the demarcation of a line of boundary. From that time up to the present moment, Persia has committed no act of hostility against the Affghans; but on the death of the late Shah, the Government of Herat made predatory incursions into the Persian territories, in concert with the Turcomans and Hazarehs, and captured the subjects of Persia, for the purpose of selling them as slaves. This system of warfare has from that time been carried on without intermission by the Affghans of Herat, and Persia has not retaliated these acts of aggression by any hostile measure, unless the public annunciation of its intention to attack Herat should be regarded as such.

"Under these circumstances, there cannot, I think, be a doubt that the Shah is fully justified in making war on Prince Kamran: and though the capture of Herat by Persia would certainly be an evil of great magnitude, we could not wonder if the Shah were to disregard our remonstrances, and to assert his right to make war on an enemy who has given him the greatest provocation, and whom he may regard himself as bound in duty to his subjects to punish, or even to put down. I therefore doubt whether the measures proposed by the Government of India would have the desired effect. I am disposed to believe that if the Shah found circumstances favourable to the success of an expedition against Herat this year, it would be necessary to resort to much stronger measures, before he would be induced to desist from the undertaking; and I am not quite satisfied whether it would be advisable to produce the alienation which must result from the measures proposed, unless we are prepared to go further and to insure success, by convincing the Persian Government that we are prepared to act as well as to threaten.

"At the same time I am convinced that the Shah would act more prudently and wisely, if he were to seek to remove by negotiation the evils of which he complains; and I have already found an opportunity of offering to Persia the good offices of this legation, without formally tendering them.

"No disposition has yet been evinced to seek our mediation with Herat; and I have continued to refrain from making the relations of Persia with that Principality a subject of discussion; but in answer to some observations of the Prime Minister, I informed him some time ago that the Ninth Article of the Treaty of Tehran forbade England to afford any assistance to Persia, so long as she might be at war with the Affghans; and that before any assistance could be given, whether in the supply of arms or otherwise,

either the Article in question must be got rid of, or peace must be concluded with Herat."

There was evidently no denying the right possessed by Persia and her sovereign to chastise her refractory subject, and even if deemed necessary, to dispossess him of a power he had so flagrantly abused, as well as of the means of maintaining that power: namely, the occupation of Herat. Not content with the violence he had offered to his paramount authority, Prince Kamran assumed the style of Shah in his letter to his Persian superior himself, and even that of Asylum of the Faith, as an independent prince, though Dost Mahommed admitted the Shah's superiority over that country. Mr. MacNeill was distinctly told by the prince's envoy that his master did not mean to relinquish that title.*

We do not imagine that any of our readers can hesitate as to the tendency of the course stated in the following extract:

"After having communicated with Futteh Mahommed Khan, the Envoy from Herat, who called upon me here, I found that while the Vizier's (of Kamran) letter to the Ausef (Persian negotiator), was written in a strain of submission, Kamran, Shah of Herat, in his letter to the Shah of Persia, had preserved the style and title of an independent Sovereign. Though he addressed the Shah with deference and respect, he did not address his Persian Majesty as his Sovereign, and his signet bore the inscription, which has been used for several generations by the royal family of the Affghans, describing him as 'Shah dor Doraun.' The Envoy also informed me that there was no intention on the part of the Herat Government to relinquish its independence, that Kamran would not agree to renounce the title of Shah, or to coin the money, or have prayers read in the name of Mahommed Shah; and that even if Kamran had been disposed to accede to these terms, he did not dare to propose them to the Affghan nobles."

We are fully aware it may be argued that in the nature of Asiatic governments there is an essential difference from those of Europe; and that the power which gives right where none existed without it, is so fluctuating and so frequent in the former, as to introduce a wide distinction of usages between Europe and Asia. But this is the utmost that can be said in favour of the principle, or rather, the practice of subverting allegiance; and it falls manifestly short of its object. The Power that substitutes itself for Right, must be effective and actual; that is

* Yet to obtain the government he had gone originally to Tehran, and received, as a vassal, the Firmann of appointment from the late Shah.

to say, must have already wrought its own aim before it can be acknowledged, or even admitted : it must be sovereign *de facto* at least, and the proposition made by Kamran to the Shah was an admission against his own claim. Even in legislating for Asia therefore, Europe cannot act on a principle which is neither European nor Asiatic.—Kamran had also, in 1835, broken all the stipulations made with the former Shah, as Mr. Ellis's letter shows.

The point of right thus established, that of expediency follows : and hence arises the question of English interference—the second portion of our inquiry.

It is singular that from 1833 to the time we are now considering, sufficient stress was not laid by our ministers on the importance of Herat to our Indian power, though at the first named period, Mahommed Meerza, now Shah of Persia, laid siege to that fortress unsuccessfully. In 1837, however, Mr. MacNeill saw the value of that post ; and then, when another expedition was preparing against it,

“It soon became sufficiently evident that the real question at issue between the parties was the sovereignty of Herat, which the Shah of Persia claimed for himself, but which Kamran Shah was not prepared to relinquish ; and this appeared to me to be precisely the question in which the British Government was most interested. I regarded it as of the utmost importance to our security in India, that Herat should not become dependant on Persia, in such a manner that it should follow the fate of this country, or become available to any power which might obtain a control over the councils of the Shah. I therefore, not only could not advise the Herat envoy to concede this point, but I considered it my duty to say that if this concession should be made, and the relations of Shah Kamran and the people of Herat to the Shah of Persia should thus become those of subjects to a sovereign, I could take no further part in the negotiation.

“I had been instructed by the Government of India to dissuade the Shah from undertaking another expedition against Herat ; and to inform His Majesty that to prosecute this war might diminish the cordiality which had so long subsisted between England and Persia. In my despatch of the 24th of February, I expressed an opinion that the war which the Shah was prosecuting against Herat was a just war ; and I ventured to question the advantage, under such circumstances, of endeavouring, by implied threats, to dissuade him from renewing it ; but when the Herat Government offered terms so very advantageous, that I felt convinced Persia could not by the conquest of the place, have gained so much in strength and security, it appeared to me that the war had from that

moment become on the part of Persia, an unjust war ; and that having been requested by the Persian Government to take a part in the negotiation, while the Herat Envoy had placed himself entirely in my hands, I could no longer with advantage maintain the reserve I had hitherto thought it advisable to maintain in regard to this question. I therefore determined to take this opportunity of making a stand ; and to remove every excuse for mutual distrust, I ventured to engage, on the part of the British Government, that it would use its endeavours to get the terms fulfilled by both parties. While I was determined to maintain, at all hazards, the principle of the independence of Herat, I did not object to the concessions which were voluntarily made by Shah Kamran ; because, so long as the Persian Government was precluded from interfering in the internal affairs of Herat, and marching troops into that country, Herat would form a barrier against the further advance of Persia in that direction, and one, too, which by an engagement to look to the faithful observance of the proposed arrangements, we should have acquired the right of assisting to guard.

“The pretensions of Persia to the sovereignty of Affghanistan appeared to me to be such as we were neither called upon by a sense of justice, nor permitted by a due regard to our own security, to sanction or allow. I thought I could show, from our treaty with Persia, that the Affghans were looked upon by the Persian Government itself, at the time when that treaty was signed, as an independent nation ; while the fact of our having concluded a treaty of defensive alliance with their sovereign, in 1809, precluded the possibility, so long as they preserved their actual independence, of our being called upon to acknowledge them to be subjects of Persia.

“In my letter recommending the Persian Government to accept the terms offered by the Herat Envoy, I had stated my fears, that if these terms were rejected, and troops were sent against Herat, the British Government might suspect that Persia had in view, in prosecuting the war, other objects than those which she had avowed. His Excellency refers to the perfect union of the nations as an answer to this statement. In my reply, I have thought it necessary to point out to him that the course pursued by the Government of the present Shah has not been that which was best calculated to secure to Persia the advantages of that perfect confidence in her views and intentions which she expects the British Government to feel ; and I have endeavoured to make his Excellency perceive, that if Persia is deterred by fear of others from rendering justice or evincing her friendship to England, such a state of things must effectually destroy all confidence in her policy, especially as the increasing disorganization and weakness of the Government must tend to increase the evil.

“I think it possible that this discussion may, for a time, produce, some unpleasant

feeling on the part of the Shah and his Minister towards myself."

We extract, for the sake of further illustration, the most material points of "certain propositions submitted to the Persian Government by Futteh Mahommed Khan, Agent from the Government of Herat."

"1st Point.—There is to be a cessation of war and of marauding; the capture and sale of prisoners are to be utterly abolished.

"2d Point.—Should the King of Kings intend to undertake a military expedition against Toorkistan, and should he require troops from Shah Kamran, the latter is to supply troops to the extent of his ability, and they shall accompany the Governor of Kho-rassan on any expedition against Toorkistan. Should troops be required on the frontiers of Azerbaijan, Shah Kamran shall furnish them in such number as may at the time be practicable, and shall not withhold them.

"3d Point.—A sum of money in the shape of tribute shall be paid annually, at the festival of Noorooz, to the Persian Government.

"I engage for the performance of the foregoing stipulations on the part of my master Shah Kamran, on condition that the following engagements shall be agreed to.

"1st Point.—The King of Kings of Persia shall consider Shah Kamran as his brother and treat him with regard.

"2d Point.—The Ministers of the King of Kings of Persia shall not interfere in any manner whatever in the succession of the posterity of Shah Kamran. Whichever of the descendants of Shah Kamran shall succeed him in his government and titles, and shall fulfil the engagements that have been here contracted, it is stipulated on the part of the King of Kings of Persia that these engagements shall continue in full force, and shall not undergo any alteration.

3d Point.—Troops shall not be sent into the territories in the possession of Shah Kamran; war and marauding are to cease; and the capture and sale of prisoners are to be entirely abolished. The Government of the King of Kings of Persia is not to interfere in any manner whatever in the internal affairs of the territories in the possession of Shah Kamran; and to enable the Government of Herat to fulfil its engagements, the internal management of these territories is to be entirely under the control of the Government of Herat.

"4th Point.—The English Government shall be mediators between the Persian and Herat Governments; and if there should be any infraction of these engagements by either party, it shall employ every exertion to obtain their fulfilment.

The view taken by our Envoy, MacNeill, of these propositions will appear by the following extract from a letter to the Persian Prime Minister.

"Your Excellency will observe that in this document all the engagements which imply exertion or expense, or concession, are those which the Herat Government will be called upon to fulfil; and that the engagements which the Persian Government is here called upon to enter into, bind his Persian Majesty only to forbear from interfering in the internal affairs of Herat, but do not make it necessary to spend one farthing of money, or to make any exertion of any kind. That on the other hand the Herat Government engages to give hostages, of which one is to be a son of Shah Kamran, and the others are to be relations of his Vizier and his brother,—that it further engages to give Peeshkush,—to furnish troops when required—to protect merchants—and, what is most important, to restrain all persons under its control from plunder and from the capture and sale of slaves. For the due performance of these engagements the Persian Government will have not only the solemn pledge of the Herat Government, but also the assurance that the British Government will use its best endeavours to get them carried into effect. As your Excellency entirely doubted the sincerity of the Herat Government, you will no doubt fully appreciate this part of the arrangement.

"Let his Persian Majesty's Ministers themselves decide whether it is more advantageous to the interests of Persia to conclude this arrangement, which secures advantages so great and so obvious, or to undertake military operations against Herat, which are disapproved by the British and other friendly Governments, and which cannot fail to entail an immense expense on this Government, and to exhaust its military resources, while the result must still be doubtful. Whether it is better to accept terms so honourable to his Persian Majesty, or to drive the people of Herat to the necessity of making a determined resistance, and thus incurring the hazard of failure, and the evils (may God avert them) which must follow such a misfortune. It is also worthy of your Excellency's wisdom and knowledge of affairs to consider whether, even in the event of success against Herat, the Persian Government could derive from the capture of that place, advantages so great and permanent as it may secure to itself by accepting the present proposals, coupled as they are with the mediation of the British Government."

From the Persian Minister's answer to the above-mentioned propositions we take the following passages, which seem to us perfectly reasonable, and involve all the material considerations of the point at issue.

"Throughout the propositions of Futteh Mahommed Khan, the designation applied to Prince Kamran, is Kamran Shah. This is precisely the point which is the cause of the movement of troops, that these pretensions may be destroyed. Two kings cannot

dwelt in one kingdom. The title of Feridoon Meezra, the Governor-General of Fars, which is ten times as large as Herat, is Ameerzadeh, son of a prince, (not prince). This phrase conveys the impression of disobedience and refractoriness, and the remedy is to cease to employ such expressions.

"Third point.—That tribute shall be paid annually at the Noorooz. He who is obedient must of course pay tribute and taxes; he must read the Khootbeh (prayers which imply royalty), and strike the coin in the name of the king, the Asylum of the Faith (king of Persia); and he must, at all times, and on all occasions, acknowledge his obedience and subjection; and he must avoid the inconsistency of endeavouring to form a treaty as if Persia and Herat were two separate kingdoms.

"In regard to the first proposition of the engagements by Persia, that the King of Kings of Iran shall treat Prince Kamran as his brother.—The treatment of the king, the Asylum of the Faith, to Feridoon Meerza, (the King of Persia's brother) is that of master to his servant. Let Prince Kamran be like Feridoon Meerza, for higher expectations would be presumptuous. It might indeed be proposed that he should be treated with more favour than his Majesty's brother; but no one can presume to aspire to be regarded as brother to the King of Kings; for all are the devoted servants of the great King.

"In regard to the second proposition (of the engagements by Persia) after the acknowledgment of obedience, and the payment of the taxes, the Ministers of the Persian Government will not interfere in the affairs of Herat, and any deviation from this course will be contrary to royal justice; but if otherwise, beyond a doubt changes and alterations will be introduced, and the severest punishments will be inflicted on the people of that country.

"In regard to the third proposition; why should military expeditions be undertaken against a country which has acknowledged its subjection? Troops are sent against the rebellious and refractory—not the submissive and obedient. Who would seek to inflict evil on his own dominions?

"In regard to the fourth proposition,—the British Government, from the friendship subsisting between both states, is always listened to, whenever it gives counsel beneficial to Persia and its provinces. After the acknowledgment of subjection by the people of Herat, and the performance of service, then whatever the British Government recommends, shall be without doubt assented to.

"The language which Futteh Mahommed Khan held to your Excellency, varied exceedingly from the letters which Yar Mahommed Khan (Vizier of Herat), addressed to the Ausef-ud-Dowleh, and which Your Excellency has perused and taken a copy of; the propositions have no connection with that document; therefore no confidence is to be

placed in the declaration of Futteh Mahommed Khan; and if any discussions were to take place, no reliance could be held in his assertions."

This discrepancy between the language held by two negotiators from the same sovereign might well create suspicions and distrust in the Persian prime-minister; and further ground for these doubts is afforded, as appears from the next extract.

"Your letter, written with the pen of friendship, has reached me: and I have perfectly understood the contents. I was in expectation of the arrival of intelligence from his Excellency, the Ausef-ud-Dowleh, that might inform you of the real state of things. On the day of the arrival of the Agent from Herat, I despatched a messenger in haste, in order that if the Rulers of Herat had any serious intention of submission, the Ausef-ud-Dowleh should desist from military expeditions, and from the expenditure of large sums of money. Yesterday, letters arrived from the Ausef-ud-Dowleh to the Master of the Ceremonies, demanding that troops and money should be sent to enable him to proceed against Herat. Since the Ausef-ud-Dowleh has made these demands, it is evident that he has lost all hopes of their submission, because on these occasions they have attempted similar deceptions by promising obedience; and then, when opportunity offered, they did not desist from taking prisoners, and undertaking military expeditions against Khain, Seistan, Furrak, and other places; and also from giving access to the marauding incursions of the Turcomans into Khorassan, so that those frontiers are deprived of all tranquillity, as your Excellency perceived the day before yesterday, from the letters of learned and holy men in Khorassan. Similar representations are sent here in great numbers; but the detail of them would be useless. In short the affair is in this situation—the man considers himself an independent sovereign; he refuses to make submission, and does not desist from violence. Such being the circumstances, what is the duty of the Ministers of this state? Is the protection of the subject, the repose of the poor and wretched, the duty of royalty or not? Could any monarch in your own country, tolerate such disorders in his dominions from a place like Herat, which usually has been the Capital of the heir to the throne of Persia?

"At the conclusion of your letter there are some remarks about alarm. I am in great astonishment at this declaration, considering the distance of four months' journey, and the great friendship between the two States, which, during this length of time, has never been interrupted by a hair's breadth on either side. What cause is there for alarm or for these remote speculations which have never entered into the mind of any one, nor ever will? Finally, as your Excellency is a sin-

cere well-wisher of both States, I have given you this trouble."

With every disposition to question the good faith of Persian negotiations at all times, here are statements distinctly and formally made by the Prime Minister of a sovereign, that a course of insecurity and deception is pursued by a subject Prince towards his superior, and the allegation so far as we can see remains uncontradicted. We are bound then to receive it as true; and need only ask, what security the Persian Government could look for as to the faith of Kamran? and, whether, as an independent power, they had not the right to punish a "refractory" aim at independence on his part. To deny the last is to place Persia in tutelage: and as to the former question, Persia could scarcely acquiesce in the guarantee of Britain when the British negotiator had declared his resolution "to maintain at all hazards the independence of Herat"—against its acknowledged sovereign.

We are now considering the case simply between Persia and Herat; and, in strict reasoning, could Persia, we ask, have submitted to such terms, so declared, without becoming virtually the vassal of England?

We find from these parliamentary papers that, except Kamran, all the chiefs of Affghanistan acknowledge their subjection to Persia; yet the British envoy "thinks he can show" that in spite of their own declarations and feelings they are absolutely independent, because they are virtually so: for this alone can be the meaning of the word *actual*, applied by him to men who confessed a nominal subjection. The treaty of 1809 could, we submit, be looked at under this very material consideration, only as a case of *quasi* independence: or one which, at best, had ceased to exist.

We must repeat that, setting aside for the moment the interests of England, and viewing the question simply as between Persia and Herat, the former had a right to take ultimate measures if she deemed it necessary: for though the treaty concluded by Sir H. Jones in 1809 with Persia contemplated war between her and the Affghans, or between these and British India, yet these were cases of *de facto*, not *de jure* independence on the part of Affghanistan; nor is any allusion made to this distinction in the treaty itself. The treaty concluded between Mr. Elphinstone and Shah Soojah at nearly the same period provides for the defence of India against France and Persia by Affghan aid, and thus comes nearer to the point. But as the advance was to be made

THROUGH AFFGHANISTAN, it was evidently contemplated there would be in the first instance an invasion of the latter country by its lord paramount, allied with a foreign force. Thus too Affghanistan, *de facto* independent, though *de jure* subject, was to be assailed in the first instance, and by strangers as well as friends, before she could act; and this action to be but defensive.

But Mr. MacNeill "thought he could show" that a treaty made with a foreign power proves an actual independence! When France made a treaty with the Americans against England, did the latter ever dream that it lessened her claim to allegiance? How stands Egypt with Turkey? or is a robbery right because a friend helps us? We fear Mr. MacNeill's defence would not save his client from transportation at the Old Bailey. What difference could Persian statesmen find between the subjection of Affghanistan to Persia, and the precisely analogous subjection of Egypt to Turkey? And yet in the latter case, all Europe insists that Mahomet Ali shall NOT DECLARE himself independent of the Porte, while England, a party to this very course, finds her Minister in Persia insisting that Kamran SHALL declare himself independent of the Shah, and Great Britain is to support him in throwing off his allegiance! Had not the Shah a right to be irritated against a policy that was blowing hot and cold from the same mouth, in the same moment? Had not he, had not the actual rulers of Affghanistan, before their eyes the fateful precedent of the Marquess of Hastings' premeditated treachery to the Mogul in the case of Oude? (F. Q. R. No. xlv. p. 58), carried out too, as it was to the final act, by the very Lord Auckland who was (No. xlv. p. 55) disclaiming the act and taking advantage of it at the time; and who, with a magnificence of profession that has moved already (No. xlv. p. 58,) our sincerest admiration at his generosity in lavishing words, writes from Simla under date of May 15, to Mr. Macnaghten,* as follows:—

"In any discussion upon the present policy of the Indian Government, you may remark that the Governor-General has no appetite for wars and conquests; that the boundaries of the Eastern Indian Empire have seemed to him to be amply extensive; and that he would rather conquer the jungle with the plough, plant villages where tigers have possession, and spread commerce and navigation upon waters which have hitherto been barren, than take one inch of territory from his neighbours, or sanction the march of ar-

* Policy of the Government of British India as exhibited in Official Documents. Allen. 1839.

mies for the acquisition of kingdoms; yet that he feels strong in military means, and that with an army of one hundred thousand men under European officers, in Bengal, and with one hundred thousand more, whom he might call to his aid from Madras and Bombay, he can with ease repel every aggression, and punish every enemy; yet he looks on this army only as a security for peace, and as an instrument of preserving in their integrity the present territories and the dignity of the East India Company."—*Papers laid before the House of Commons by her Majesty's Command*, No. 4, page 6.

The "British policy in India," as exhibited in this official document, is somewhat different certainly from that "exhibited in official" acts of his Lordship such as we have just referred to. Whether the great Arabian-Night was at the time of penning this humorous epistle seeking, as has been insinuated, to share with his friend Runjeet Sing an enviable immortality, by offerings at the temple of Amreetsir, we cannot presume to determine; but sure we are that in his efforts to obtain

"The Amreeta cup of immortality"

his Lordship has as little hesitation, as his predecessors in Indian fable, in stirring up earth, ocean, and Mount Meru itself, for the accomplishment of his lawful desires.

The question of our envoy's interference, however, is not limited to the Persian view, the abstract right, of this case. It was justly held by Mr. Ellis first, and Mr. MacNeill afterwards, a matter of considerable importance to our Indian Government and possessions. It might, in the circumstances and under the influence which was then swaying Persia to foreign movement, have become a serious thorn in the side of the British Government as regarded Central Asia; and viewing the unwarrantable proceedings and open hostility of the Russian agents to our power and influence in the East, the point became one of defence against encroachment, resistance to aggression; in fact, of self-preservation. But the necessity on our part did not annihilate the right of the Persians; it only set it aside for the time, preventing them from acting upon it to our prejudice. There is a wide distinction between the two; but it seems to have been lost sight of by us; and it has made us, in our own opinion most unjustly, hostile to the Shah of Persia, by visiting him with an obloquy due only to the insidious ambition of his Russian advisers. The Shah, we contend, wished to right himself, and probably also to efface the disgrace of his former failure before Herat; and he em-

braced this opportunity offered by an alliance that appeared calculated to ensure success; though it proved in the event most injurious to his aims, by rousing the jealousy first, and then the might, of Britain against them.

It does seem to us not a little extraordinary that so soon as the growing importance of the country of the Affghans became apparent to ourselves, and the intentions of the Shah began to threaten danger in that quarter, that no care should have been taken to form a right of defence by treaty, and to establish the security of so formidable an outpost as Herat has now proved to be, for our Oriental possessions and commerce. Yet this point, which must have been obvious in 1832, and which might surely have formed a stipulation in the terms that gave Mohammed Shah his crown in 1835, appears to have escaped notice; not by Mr. Ellis certainly, but by those whose duty it was to attend to the suggestions offered, and to act upon them. Whether the fault lies with our rulers at home or abroad, with the living or with the departed, we shall not now inquire. Years have passed since it was made; and, fortunately for England, she has in India at this moment a statesman capable of overshadowing any errors of any of his predecessors.

Old men, says the German proverb, talk of what they have done; children of what they are doing, and fools of what they are going to do. In which of these categories we are to place the Author of the far-famed proclamation of Hindostan is a matter of some little delicacy: and we carefully, as the reader sees, avoid the subject, inasmuch as his Lordship, notwithstanding the suspicious researches hinted in our last number, shows none of the symptoms supposed, in the East at least, to accompany the beard of the former, and none of the innocence attributed in the West to the second classification. That exemplary functionary may, it is true, be a "close shaver," but the fact is by no means conspicuously obvious, despite his recent taste for edged tools. Having, however, and perhaps for the want of a sufficient military biographer, heard nothing whatever of late of the renowned exploits and adventures of this "ingenioso hidalgo," we fear that, like his Manchegan prototype, the Oriental "Caballero de la triste figura" must be cutting but a very sorry figure, since the gallant army and the grand expedition itself broke down in the might of his first, intended, achievement. That his vast preparations could have been dispensed with is probable, since Captain Wade assures us (*Parliamentary Papers*, No. 5), that had but a single British officer at the right time ac-

accompanied " * the indolent and sensual " Sooja, his (whose?) "*simple* appearance would have restored him" to the throne. But the simple ones, it would seem did not love simplicity such as this; and of the large force of 25,000 men, raised instead, and at the *farthest* convenient point from the scene of operations, we should now reckon as in a dream, were not the expenses yet to be paid.

It cannot, we imagine, fail to strike every reader of these Parliamentary Papers, that though the English agents and ministers engaged in or near the scene of negotiations felt fully and intimately the necessity of promptitude, yet that that feeling was never acted upon by the competent authorities. For at least two years the Shah's intention was notorious; for at least two years the necessity for energy had been pointed out by Mr. Ellis and others; if the urgency of the case compelled us to hold Herat from its sovereign, and by a cat's-paw for ourselves, a convention to this effect might have been concluded in good time with Kamran, who had the nine points of possession in his favour, and the will, power, and capacity to retain it. But alas! there was a tenth point, and that was Shah Sooja; in obscurity and hopeless difficulty worth all the other nine: and as, besides his own folly and weakness, he had become recently the ally of our respectable and respected ally Runjeet Sing, at sight with his own eyes of this auspicious conjunction, the Governor-General's bowels of compassion were deeply moved: and with reason. The ablest of the Barukhzye brothers, Dost Mahommed Khan, the ruler of Cabul, is represented by his panegyrist as a cheat, liar, and swindler, tolerably well-informed, and extremely affable to all who approach him, even those who come only to revile his fraud and perfidy, and is used to the bitterest, coarsest epithets. He of all the princes in question held longest by the English alliance, perhaps as the most profitable: but this complimentary preference was nothing compared with the regard of his adversary Runjeet Sing. The law of libel forbids all biography of "the old lion" of the Seikhs; we but remark of his attachment, that "it grows by what it feeds on." In the exile and distress of Soojah he had received him as a brother, and sheltered him so long as he had anything to be robbed of. His friendship for the fugitive prince had slept for years, till it was suddenly revived by the dissensions in Cabul, where something might be got by espousing the

cause of Soojah. At this crisis of the latter's fortunes Lord Auckland appeared, formed a league with the Seikh leader, and in hurrying the alliance to make up for lost time, concluded a bad bargain in its worst form, and to ensure the safety of Herat agreed to take it from him who had defended, in order to give it to him who could neither win nor preserve it—assuring further the tranquillity of Hindostan, by agreeing to take the field against every comer in Affghanistan; and confirming the rights of peace and property in this latter country by driving all its rulers from their thrones.

It is, however, even more singular and remarkable that tardy, as we have seen reason to conclude, were the final resolves of Lord Auckland, they appear to have taken our ministry at home by surprise. We are far from desiring to intimate that the British cabinet had not foreseen and issued their instructions as to general results; but the extreme reluctance continually exhibited to anything like decided measures; the unwillingness to prepare even for any great results; the apparent dread of taking the lead in any decisive step; and the consequent inclination to temporize and wait until others begin to act;—faults inherent, we fear, in every medium course, and also partly due, in the case before us, to the confessed difficulties of position and doubts of an effective support in any great emergency from either of the two extreme parties;—all these causes, united with an excessive fear of disturbing the repose of Europe and the world, gave certainly a character of procrastination to the question and checked the energies of the negotiators on the part of Britain. Of this the opponents of our influence were not slow to avail themselves; and with the unblushing effrontery that sustains and consolidates itself when there is no fear of detection; with the audacity that rises with the opportunities offered, and the presumption that hopes highest reward at home from unexampled daring abroad,—acts that, if unacceptable, mislead and confound the slower and more safe calculations of unperturbed policy, but yet claim notice, and almost encouragement for their authors, on other occasions;—urged especially by those semi-official, half-acknowledged, half-undefined instructions, so frequently written in the bureaux of the great Empire, though the formula never appear beyond the precincts of the very spot from which they were originated; which never pass the desk of the minister who framed them; and which memory alone must substitute and supply for the agent, both in the letter and the spirit of his acts, for with these the

* Notes on the Relations of British India with the Countries west of the Indus.—Allen and Co., 1839.

original instructions are rigorously compared on his return ;—against such a system, actuated and excited by the selfish vanity, national and individual, of every member, however humble, of its Governmental departments, it was scarcely to be expected that limited and cautious policy could at all prevail. But British negotiators were confined and cramped ; bound to specific rules of thought and speech ; and had only the powers of reason and argument, and the voice of dissuasion, to oppose to the unrestricted assumptions and uncontrolled offers and promises of scheming diplomatic adventurers, lavish of temptation to the ignorant triflers of Asia ; trained to know and use the follies and weaknesses of the peculiar courts to which they were accredited ; amply supplied with pecuniary means from the resources of their own proper government ; and, in some cases at least, not without distinct expectations of assistance from their chiefs, both as to arms and men ; and all this employed to persuade needy and ignorant Asiatic military rulers, and, worse even than these, their mercenary courtiers, to a course which promised immediate advantage to themselves, their patrons, and their followers.

But had the opponents of these adventurers been armed with the full powers which more or less must hereafter be given to every mission of importance in our transactions with Eastern potentates ; had Mr. MacNeill for instance been able to reply peremptorily to the efforts and insinuations made by Russian agents to the Court of Persia, that he was willing to conduct this negotiation on an amicable footing, but that the first step of hostile approach towards the outposts of the British frontier in India should be considered as an act of hostility against that empire, and be promptly treated as such ; could he have declared, not merely that he would not concede the point of the independence of Herat, but that he was resolved to support it ; and that his powers extended to the effective support of Shah Kamran by aid of money, means and supplies of warlike materials and skill, and also of men, if necessary in his judgment ; could he in fact have ordered up a regiment to the aid of the refractory chieftain upon occasion, and felt that he could do so, what would have been the result ? The whole intrigue must have been unmasked, and the Emperor would have had either to support the gratuitous and unwarranted frauds and misrepresentations of the agents by plunging at once into a war neither necessary, advantageous, nor contemplated ; or else the schemers for Russian universal dominion

would have stood exposed in the midst of their practices, and to the eyes of the very parties they were endeavouring, and so successfully, to delude.

It may be objected that such a power is too great to be entrusted to individuals ; but those employed in the East, and at such distances from their own courts, ought to be men of high abilities and sound judgment, calm perception, and accurate knowledge of position. The amicable or opponent ambassador to an Eastern potentate should be in some sort a potentate himself : high bearing, full confidence, and prompt decision are no less indispensable for the task, than a careful pre-consideration of possible cases and an ample scope allowed him for thought and action. The East differs essentially from the west ; and the despot of the former fears most of all, if not only, the indomitable firmness of a spirit strong in itself, and sustained by external support. The only successful instances of Oriental diplomacy have occurred under circumstances such as we have pointed out. Some modification doubtless would be requisite in the outline of every such functionary's duties, but the principle must be adopted ; for ignorance and barbarism mistake moderation for fear, and the want of full powers in the individual for an indication of weakness in his Court.

We have shown that so far as Persia alone was concerned she had a fair and colourable claim over Herat : and that however valuable and important might be the independence of this last for the security of British India, the Shah was not bound to take it into consideration. In fact our own part was, to have been duly apprised of the advantages resulting from possession of the fortress and district ; and then there would have been time and means for negotiating, and for ensuring probably its possession in friendly hands. The neglect was obviously on our side ; and when the Shah, smarting from the discomfiture of his former attempt, and burning with vengeance for the outrages committed against his kingdom and authority by the chappow or inroad, and the capture of so large a portion of his subjects by the ruler of Herat, was meditating the restoration of that frontier hold to the Persian empire, it was obviously but an unfavourable moment, though the last that was left us, for an estranged ally, like Britain, to attempt to sway his councils : the opportunity too, offered by the dissensions existing in Affghanistan and the neighbouring provinces, aiding his schemes, and Russian agents assisting him openly and promptly in his darling object.

The immobility of the Shah, and the first impressions of the Russian minister plenipotentiary, Count Simonich, appear from the following extract, transmitted to Lord Palmerston by Mr. Milbanke from M. Rodofinikin.

"I have the honour to inform your Excellency that His Majesty the Shah set out for Khorassan on Sunday last, the 11th of this month. Notwithstanding the little success which had attended my previous representations with the view of dissuading the King from undertaking an expedition against the Prince of Herat, I was willing still to make a last attempt. I accordingly presented to His Majesty a note, in which I no longer combated the unseasonableness of this campaign; I only endeavoured to prove that it would be much more beneficial to his interests to entrust the command of his troops to one of his brothers, if the expedition to Herat was irrevocably determined upon, and to remain himself in the Capital, where his presence appeared to me indispensable. I dwelt much on the state of his health, on the danger which there would be in his exposing himself during the great heats to so fatiguing a journey, and I required that at least His Majesty should put off his departure until the month of September, in the event of his finding it absolutely necessary, from considerations of which I might be ignorant, to draw near to the theatre of operations. I knew that if I succeeded in keeping the Shah here until autumn, the differences with Kamran Meerza might be terminated by means of negotiation. But all my efforts were fruitless. The King, being determined to set out, caused me to be summoned, and gave me verbally the answer to my note; and if His Majesty was not able to convince me of the necessity of making war upon Kamran, he at least proved to me that he was immovable in his resolution. Being satisfied that all my arguments to detain the King would henceforth be ineffectual, and not choosing on the other hand that my presence in the camp should be interpreted as if the Imperial government favoured the enterprise of the King, I determined not to accompany His Majesty, and I flatter myself with the hope that I have acted on this occasion in the sense prescribed to me by my instructions, and to the entire satisfaction of the Imperial Ministry."

We have certainly only the statements of the Russian minister to Persia for the facts, and these, it is true, may not be correctly given. But in the first place it is even consonant with general experience to suppose the count adhering to his instructions, till the determination of the Shah afforded an opening and inducement for Simonich to intrigue. That he soon obtained secret in-

structions there can be no question. In the second place we cannot doubt that the Shah's resolution was taken, and this too on grounds of undeniable right, since our two successive ministers, Mr. Ellis and Mr. MacNeill, had freely admitted the rights of the Shah, and the justice of his cause, in the first instance; and if Mr. MacNeill's opinion was changed subsequently, as it appears it was, by the very fair terms offered by Kamran, including, in the judgment of the British envoy at least, advantages which Persia could not obtain by the reduction of the fortress, still it was for the Shah, the confessed paramount lord, to decide on their eligibility in his own case. England proposed to mediate or guarantee the terms to Persia; but England had long before, and under other circumstances, agreed,

"Art. 7.—In case war takes place between his Persian majesty and the Affghans, his Majesty the King of Great Britain shall not take any part therein, unless it be at the desire of both parties, to afford his mediation for peace."

And though the treaty of 1809 was strictly defensive, and the 8th article stipulated,

"It is acknowledged that the intent and meaning of these preliminary articles are defensive. And it is likewise agreed, that as long as these preliminary articles remain in force, his Majesty the King of Persia shall not enter into any engagements inimical to his Britannic Majesty, or pregnant with injury or disadvantage to the British territories in India:—"

yet it was by no means easy to convince the Shah that the reduction of his tributary was the case like that contemplated in this clause; and even the Russian agents themselves, as appears by the treaty framed under their management, with the Sirdars, or rulers, of Candahar, had provided for the actual retention of Herat in other than Persian hands; that is to say, in those of the lords of that country, with whom the Shah was allying himself.

"Draft of treaty made by Kumber Aleé Khan, the Persian Elchee, with the chiefs of Candahar.

"The treaty which I, Kumber Aleé (literally, creature of God) have made with the respectable Sirdars Kohen Dil, Rehem Dil, and Mehír Dil Khan, on the part of his Majesty Mahommed Shah, is as follows:

"In case the Sirdars should send one of their sons to his Majesty, I promise to the Sirdars the following return.

"1. That the country of Herat, whether it be taken by the power of the servants of the Persian government, or that of the Sirdars, must be left to the latter. The

Shah should not expect any thing from them in return but service, and likewise make no interference of any kind with their country or tribe in Affghanistan.

"2. His Majesty is not to form a connection with the Affghans of any description, great or small, and also not to employ them in case of any business with the Affghans. His Majesty is to have recourse to the Sirdars."

The same is stipulated in the treaty concluded between the Shah and the Sirdars, written with the Shah's own hand and subscribed by his minister and also, officially, by Count Simonich : the Sirdars acknowledging allegiance.

"It is agreed to—please God we shall so conduct (matters) that it shall be an object of envy to all the world."

"1. The Sirdars (of Kandahar) shall not act in opposition (to the Shah) and shall not connect themselves with any one else, but shall serve truly and faithfully, they shall be friends of the friends of Persia and enemies of her enemies, and they shall not hold a friendly intercourse with persons who are opposed to (or at enmity with) the Persian government ; and they shall not act deceitfully or unfaithfully, and if they should so act, this treaty is null and void.

"II. We, (the Shah), have given the territory of Kandahar, and the territory of Herat with their dependencies to the Sirdars, with the exception of Shekkiwan, and the territory beyond it, (towards Persia), and so long as they shall not have committed any act of opposition (or hostility) these territories shall be in their possession, and in that of their heirs ; and if they should commit any act of opposition (or hostility), the circumstances shall first be communicated to the Sirdars, when if they rectify the error (or make reparation) it is well ; but if they do not, then they shall be dealt with in whatever manner the haughty government (of Persia) shall consider expedient.

"III. The Sirdars shall not attack (or invade) any other territory without the consent of his majesty the Shah : but if any of the subjects (dependants) of Kandahar or Herat, should not submit to their authority (or rebel) they are permitted to punish such persons.

"IV. The Sirdars shall treat the Ryots, and especially the Sheeahs with justice and equity, and shall protect them, and shall make no distinction between Soonnees and Sheeahs, and shall consider them all true believers and followers of the seal of the Prophets—the blessed—and they shall not, without cause, subject them to pain or injury, whether injury in person or in property.

"V. If an enemy should appear from any quarter, and if the Sirdars should themselves be unable to repel him, the Shah binds himself (or becomes responsi-

ble) to supply them (the Sirdars) with troops, artillery, and money, to whatever extent may be necessary, and not to withhold any description of assistance or support.

"IX. A peesh-kush (present or tribute) according to their means shall be sent by them (the Sirdars) yearly, to the presence of the Shah, as an evidence of their submission and allegiance, and the Persian government shall make no other demand of the Sirdars except service (allegiance).

"X. The Affghan tribes connected with Kandahar and Herat shall be given over to the Sirdars, and no one shall interfere with them, and if in time of need troops should be required of them, a small body of troops, with an Affghan nobleman, shall be sent to the stirrup of the Shah. For the pay and expenses of these troops, the Persian government is responsible, and after the termination of the service, they shall be sent back to the Sirdars.

"I, who am the minister plenipotentiary of the exalted government of Russia, will be guarantee, that neither on the part of his majesty, &c. &c. &c. the Shah of Persia, nor on the part of the powerful Sirdars, shall there occur any deviation from, or violation of, this entire treaty and these engagements."

The bearing of this treaty is so simply and clearly pointed out by Mr. MacNeill, that it would be injustice to that able and acute minister to omit it here ; especially as it expresses concisely all that might in other hands require larger space to point out.

"I have the honour to inclose for your lordship's information a translation of the treaty which has been concluded and ratified between the Shah and the Sirdars of Kandahar, and which Count Simonich has guaranteed. It appears to me, however, to be somewhat remarkable, that Count Simonich does not guarantee this treaty in the name of his government, though he uses his official designation.

"I would further beg leave to observe, that as the Shah engaged unconditionally to put the Sirdars in possession of Herat (at least, I presume, the second article must be so understood), and as Count Simonich has made himself responsible to the Sirdars for the fulfilment of the engagements contracted by the Shah, he has, in fact, as I understand the treaty, engaged to see the Sirdars put in possession of Herat.

"The indefinite nature of the engagements contracted by both parties, and the very vague manner in which the terms are expressed, even in the Persian language, must at all times afford sufficient ground for difference and dispute, and therefore for Russian interference.

"Persia engages to defend Kandahar against any enemy that may attack it, and if the Shah should fail to do so, Count Simonich engages to compel him to do so ;

at least this, I presume, is the meaning of the guarantee, if it means anything.

"The common arrangement of the commercial stipulations of Persia and Russia with a principality which is a dependency of Persia, according to the terms of the treaty, is not the least remarkable feature of this very curious document. It is even doubtful from the construction of the sentence in Persian, whether the commercial agent is not to be the common agent of the two powers.

"Finally, the effect of the treaty would be to raise up a powerful principality in Affghanistan, which shall be nominally subject to Persia, but which must always look to Russia for protection: which hangs so loosely to Persia, that Russia could at any moment, when she might desire it, put an end to the connection, and turn against Persia the strength with which the Shah proposed to endow the Sirdars. On the other hand, Russia could probably at any time make the defence of Kandahar a pretext for engaging the Shah of Persia in a quarrel with those chiefs whose territories border on Kandahar."

We must, from want of space, pass over the details of the general conduct of the agents of Russia in this Persian question; the more, as it was but a portion of the system to which our last Number so strongly called the attention of the British and European public. A concise outline of the proceedings is all we can afford.

The Shah's army marched for Herat on the 23d July; and when it had reached about half-way, that is to say, on the 10th of October, a subordinate but active and intriguing Russian agent, Captain Vicovich, reached the camp. This individual had, on his route, everywhere announced that a large Russian force was at Asterabad, to aid the Shah against Herat. No hint of his approach had been given by Simonich to Mr. MacNeill, and the former might even have been ignorant of his journey; but in this case it is clear he could have had no communication with Vicovich, and that the latter's announcements on the route could not consequently have proceeded from concert with the Count, but from secret directions of his superiors at home. Now as the chief of the foreign department, Count Nesselrode, must, or at least ought to have been cognizant of Vicovich's journey from Petersburg, and its object, and yet, in vindication of Simonich, he had just before given in reply to Lord Palmerston's expostulations, the letter of Count Simonich to M. Rodofinikin, quoted above: and as on a subsequent remonstrance from the British ministry as to the conduct of the Russian agents and their intrigues, avowedly for the purpose of injur-

ing British influence in Asia, the same minister had the hardihood to declare that he was totally ignorant of any such proceedings: and this was twelve months after they were in full activity;—taking, as we have, these salient points, how can Count Nesselrode be trusted in future?

Those who have known Count Nesselrode, know the face of this distinguished character to be the undoubted mirror of his mind; in one sense at least, for it never shows any thing but the surface; and none can have approached him without feeling that, ready and prompt as he is in discussions, he meets facts and observations rather than suggests them, and though always informed, is always prepared for silence. It is difficult to start a subject on which his knowledge is not copious and profound, and impossible to leave one without perceiving that he has said no more on it than was unavoidable; that even if he has given a judgment he has never expressed his opinion, and that though his manner is always indifferent, his perception is astutely vigilant. No man could ever doubt his penetration, or trust his sincerity; and yet it is of this man we are to believe, that he, the aristocrat of the Bureau, was utterly ignorant of the open proceedings of his own agents in Persia for years. Doubtless on the other points of bad faith, as the European politics to which our last Number adverted, he is equally innocent.

To resume our outline. We have noticed that the Cabul Chief, Dost Mahommed Khan, had remained longest true to English interests and alliance; and that he had preferred this to the Russo-Persian advances, having the choice of the two, is shown in our former Number. He was driven by British refusal to try elsewhere; but in 1836 he again turned to Lord Auckland, who sent him Sir Alexander Burnes as a mediator and pacificator; but urgent as was the real necessity for dispatch in reaching Cabul, Captain Burnes had been charged with other and previous business on his route. He was forestalled, therefore, by the arrival of the Persian envoy at that Court; and, still worse, obvious as was in 1835 the political tendency of affairs there, his instructions, in 1836, were chiefly commercial; and he reached his post only twelve months afterwards, though by no fault of his own. In 1837, therefore, by the gross neglect, oversight, and supineness, that had delayed, perverted, and limited his powers, he found himself, in spite of his high talent, foiled, prevented, and mocked by the agents of Persia and Russia. These narrow limitations of diplomacy are ever fatal in the East.

The object of Dost Mahommed was pro-

tection against Runjeet. He sided with Captain Burnes at first. His brethren of Candahar, false to him and to all others, negotiated with Russia and England, but decided on nothing. All parties waited for events; and the siege of Herat was to turn the scale by its success or failure. During this most important crisis Lord Auckland was tranquil—the English commissioner in Persia powerless beyond words. What would not have been obtainable, then, by a determined tone of resistance, by a single act of vigour to support that resistance? If a tenth of the army afterwards so fruitlessly and extravagantly put in motion in Bengal had been then in readiness, and at hand; had even the troops from Bombay, so much nearer the scene of action, been ordered to advance, would the faith of Runjeet Sing have been doubtful, or to be feared?—he who stood on the brink of an Affghan war. Would the Barukhzye brethren have believed in English weakness and in Russian aid, with the facts conversed before them? Would 3,000 or 6,000 men have been inefficient in Affghanistan, where a single British agent would have sufficed, according to Captain Wade; such being even then the estimation of the English name and power? and would not even 1,000 men have saved Herat itself from the dangers and horrors of the siege, when the single presence of the gallant Pottinger within its walls averted its reduction, and saved the whole country?

The difficulty as to the fortress of Herat and its government reduces itself simply to this dilemma for England. The severance of that town from Persia was either right or wrong on political grounds; it was justifiable or it was not. If right, no time should have been lost in laying down the principle distinctly and preparing to act on it; if wrong, why was a force ultimately sent from India to effect it? The question of circumstances can be of little weight at the juncture, for the resolve of the Shah was peremptory, the conduct of his Russian advisers hostile; what worse was to be apprehended? The ministers of the former threatened a march upon Delhi, the newspapers of the latter a peace at Calcutta. Captain Wade, our agent at Loodiana, thus intimates the necessity of vigour.

“It may appear an act of supererogation in me to add my testimony to that of Mr. MacNeill as to the basis on which the negotiation should be conducted; but as his Lordship is aware of the extreme importance which I have always attached to securing the independence of Herat, whilst it is a source of satisfaction to me to find my view of the subject confirmed by an officer

of the enlightened judgment and long approved experience of our present Ambassador in Persia, I cannot help agreeing in opinion with Mr. MacNeill that it ought to be the primary object of the British Government to ‘maintain, at all hazards,’ for reasons which I have often declared, the integrity of Herat, as the only safe and sure means of opposing the efforts of Persia to annihilate the independence of Affghanistan.

“The position in which our discussions with respect to Herat are now placed, is one from which no consideration of submission to the views of Persia should, I think, divert our attention. It may be presumed that his Persian Majesty will not dare to act in opposition to our views and wishes when openly avowed, and steadily maintained. Although the friendship of our Government may be less directly felt by Persia than her alliance with the Russian Government, it is still sufficiently valuable to deter her, I should imagine, from seeking a separation of interests between the two States; for, supposing even that she were prepared to bid defiance to British counsels, the Shah cannot even expect that we should remain spectators of the prosecution of designs which threaten the peace and tranquillity of British India, and the prosperity of our commerce in Central Asia, without an attempt to counteract them; and as Persia can scarcely pretend to encounter the probable effects of our indignation, it would surely be difficult for her to carry out her schemes of conquest towards Affghanistan without throwing herself on the support of Russia, which, not having the power of affording her effectual aid in money, would proffer it in men; and the result to Persia would be an inundation of Russian troops into the fairest provinces of that Empire, which, though intended to advance, would eventually destroy the independence of the Persian monarchy. When viewing, therefore, the real interests of their Government, such is the light in which, I should infer, that the advisers of the King, and certainly the majority of his people, would be inclined to regard the consequences of offending the British Government.”

By the supineness exhibited, however, on this point, the Princes of Affghanistan were encouraged to receive agents and induced to believe that Britain trembled before Russia. Lord Auckland indeed, good easy man, suspected no harm at Cabool.

“His Lordship attaches little immediate importance to this mission of the Russian Agent, although he will bring all the circumstances connected with it to the notice of the Home Authorities, as it undoubtedly marks a desire, which has long been known to exist on the part of the Russian Government, to push at least the influence of their name to our Indian Frontier; and the pro

ceedings, especially of the Russian Envoy at Tehran, in regard to it, are open to much observation."

And this was on the 20th January, 1838, nearly a month after Captain Burnes had written to apprise him that,

"On the evening of the 20th instant, the Ameer received the Russian messenger. On the agent producing Mohammed Shah's Ruckum, the Ameer felt a degree of irritation which he could hardly control, and said, in Affghanee, 'that it was an insult to him, and a proof of Mohammed Shah's being guided by advisers; for his master, the Emperor, wrote him a letter, and the subservient Shah of Persia arrogated to himself the right of sending him a ruckum, or order with his seal in the face of the document.' The agent was then dismissed, and invited to the Bala Hissar on the following day. The communications which passed on this second occasion, have been also made known to me, and are of a startling nature."

A little more acquaintance with the world might have induced Lord Auckland, in spite of the Oriental relaxation of his nerves, to rouse from his *siesta* and read Captain Burnes's letter himself. Had he done so he might, and must have been struck with the fact of Dost Mahommed's veneration for the Russian Emperor above his own acknowledged sovereign. A far clearer comprehension, but the same reluctance to decided steps, marks Lord Palmerston's letter to Mr. MacNeill of May 21, 1838.

"If, when you receive this despatch, you shall have succeeded in inducing the Shah to retire from Herat, either with or without an arrangement with the Ruler of Herat, you will have accomplished an object of great importance to British interests in the East: and you will then only have to express to the Shah the lively satisfaction which Her Majesty's Government will derive from this proof of friendly deference on the part of the Shah to the wishes of the Government of Great Britain.

"But it is possible that you may have failed in the object of your journey, and that when this despatch reaches you, the Shah may be still engaged in besieging Herat; or may have taken it, and not have advanced beyond it; or, having taken it, may have marched further into Affghanistan.

"In either of these cases, you are instructed to proceed at once to the Shah; and to declare to him explicitly that the British Government cannot view with indifference his project of conquering Affghanistan.

"That the British Government must look upon this enterprise as undertaken in a spirit of hostility towards British India, and as being wholly incompatible with the spirit and intention of the alliance which has been established between Persia and Great Britain.

That consequently, if this project be persevered in, the friendly relations which up to this time have so happily subsisted between Great Britain and Persia, must necessarily cease; and that Great Britain must take such steps as she may think best calculated to provide for the security of the possessions of the British Crown."

On the 27th July, however, as the summer advanced, the Foreign Secretary evidently grew warmer, and accordingly he writes—

"I have to instruct you to state to the Shah of Persia, that whereas the spirit and purport of the Treaty between Persia and Great Britain, is, that Persia should be a defensive barrier for the British possessions in India, and that the Persian Government should co-operate with that of Great Britain in defending British India; it appears on the contrary, that the Shah is occupied in subverting those intervening States between Persia and India, which must prove additional barriers of defence for the British Possessions; and that in these operations he has openly connected himself with an European Power, for purposes avowedly unfriendly, if not absolutely hostile, to British interests; that under these circumstances, and as he has thought fit to enter upon a course of proceeding wholly at variance with the spirit and intent of the abovementioned Treaty, Great Britain will feel herself at liberty to adopt, without reference to that Treaty, such measures as a due regard for her own interests, and the security of her dominions may suggest."

The error, as we have said, of the whole course was, the not considering the Shah of Persia's offensive movement on Herat as a real preliminary of war against the British possessions, an offensive political movement against Great Britain. All saw the importance of the place, and of its independence of a power so devoted to hostile interests as Persia now became to Russia. The siege commenced; and but one Englishman was in the way to bar the progress of danger: Lieutenant Pottinger threw himself into the place; and gallantly as the siege was carried on, under his guidance it was even more gallantly resisted. A British officer flung himself singly into the gap, and saved the great bulwark of his country's foreign power and possessions;—while a British governor in the East and a British ministry in the West were discussing proprieties in luminous despatches, and wishing that things would not happen as they would!

At length the Governor-general, who had slept like a dormouse, bethought himself of stirring, and this with an energy that does honour to his British spirit. An expedition to Karrack paralysed the northern efforts of the mismanaging Shah, and the rumour of

preparations in Calcutta relieved Herat from his presence. A mere breath of English resolve scattered the powers of the Persian, as a single mind of English mould had baffled his and his allies' skill before Herat.

We need not go into the farce of the explanations offered by Count Nesselrode, apparently spontaneous, but not dreamed of till he knew from the Russian ambassador that the formal demand for them was on the point of being made. It was easier to shuffle off a reply by referring to an untasked document, than to meet the questions categorically. The full benefit of the manœuvre let him enjoy: it has deceived no one in Europe; and none less than his master.

Few who have calmly viewed the course of events latterly, can, we conceive, entertain a question but that the march of Russian policy in the East has received a strong and timely check; but this has been not from one, but two quarters; not only from without, but from within. England has her just share in the measure; all, though tardy, that is commensurate with her rights in Asia and her strength. But, as we stated many months since, the Russian agents in the East unquestionably felt a strong drawback to their proceedings in the absence of anything tangible, beyond the money that was actually taken from the chest of the Russian embassy to aid Persia, in support of their promises. The Russian corps in the Persian service had been long formed, and there are abundance of British and other officers serving in the country; but the movement of Russian troops could not have taken place to any extent without the consent of the Emperor, and this, it is clear, was never obtained: no troops appeared. The good faith of Nicholas in this matter we do not question; but we can give him credit for it only on the supposition that he is constantly betrayed and circumvented.

What then are we to think of the symptoms of his displeasure; the punishment of those concerned in the late nefarious proceedings? The minor agents have been recalled or disgraced it would seem, but where is Count Simonich, and where the Minister of the Foreign Department? The former remaining long enough to draw up plans for the Shah: the latter sacrificing his confederates, but in this one scheme alone, to retain a post from which he cannot be spared, as he holds the keys of all the European intrigues to which our last number referred.

The time for their development seems now approaching fast, Persia renewing on one side her claims on Herat, and on the other aiming at Sultanieh. An Egyptian army

moving upon Bahrein and Bassora, another concentrated in Syria, which abhors her ruler; and the fearful tyrannies to which she has been subjected, have raised a strong feeling to throw off his yoke at the first opportunity, though the scattered and destitute state of the population, and the absence of means, render all combination and concerted movements impossible for them. It is the unsparing cruelty exercised every where indiscriminately under the Pacha's orders, that has left him not a spot of ground throughout the land which is not ready to rise in insurrection. Much of this on the Pacha's part is necessity, induced for supplies for his army; much of it is intrigue, to furnish a pretext for maintaining a large force; much of it is wanton, or at least unheeding, cruelty.

Egypt, detesting Mehemet's sway; impoverished by his avarice, which is more political than personal; abhorring even the very improvements on her soil, that add only to the misery of her children by forced and thankless labour for their grasping taskmaster; and bleeding at every pore from the horrible personal cruelties inflicted in every district by his command; with her crushed, impoverished, mutilated population, is drained of men for the army that confirms her in hopeless subjection. The talents, sagacity, and intellectual superiority of Mehemet Ali are unquestionable: but they render his vices the more prominent, though these are the vices of his position. His army has been, and must be, the sole source of his power: and all efforts, all improvements, all gains, are wrung from the country into his own coffers for the maintenance of this, which is also his sole maintenance, and that of the state he has created despite all obstacles; and which he holds by the mutual jealousies of Europe.

Mahmoud and Mehemet Ali are constantly forced into comparison; but if their reforms were equally great, their positions equally difficult, the latter at least were essentially different. Turkey, though misruled by the Court and dominated by the janissaries, in her weakness and decay still had institutions. The body of Ulema, and the sanctity of the Mufti were a check, if not a counterpoise, to the Sultan's authority; and thus learning and religion, the Head of the Faith and the Guardians of the Law, supplied in the simplicity of Asiatic forms, those more popular elements that compose European civilisation. The Pacha had no council but his followers, the panders of his passions. Egypt was always a slave, and of the humblest grade.

Of Turkey we have often spoken: but

her weakness renders it necessary for Europe to guard against the too great extent of her listless dominion, and her wish to hold the two great channels of Eastern trade in her hands, since she could not retain them against Russia. Her power and commerce, paralyzed on the north-east and severed from her on the south-west, are more likely to consolidate within a restricted dominion, than when spread over a wide space which her fleets were unequal to protect, and which drained and exhausted her finances with little comparative return. Her poverty requires Syria.

The separate existence of Egypt then is a political necessity for Europe; more especially at this moment when Turkey is the reluctant slave of the Czar: now rousing in jealousy against his influence, now lapsing in despondence under his protection. But how long is this to continue?

The necessities and mutual jealousies of Europe, if they require the separation of Egypt, require even more strongly the independence of Turkey. Little likely, from the fortunate accident of her creed, to amalgamate with any one of the Christian powers,—she may be, advantageously for all parties, the friend of all. But this friendship must never be subservience to one, or else it will become enmity to the rest. Austria would be thereby excluded from foreign commerce: France, if she retain the Tuscan or eastern, would be excluded from the Ionian or western Mediterranean; and her jealousy of Russia no less than of England has spread her colonies to Algiers and is progressing along the African coast.

The question now is simply, Can Russia be suffered to aid Turkey against Egypt, when the price of that aid is by secret articles, at this moment;—stipulation of positions that shall confirm and consolidate her contested pretensions towards Asia? The occupation of Turkey for a time must end, as all such occupations have ended, in the ruin of that state: not by actual incorporation, however, but by a servile alliance; a surrender of posts into her ally's keeping, which may be temporary, but only because they will be exchanged for others more suited to Russia's Eastern views. Can she be permitted to approach by one, the slightest, incidental step, towards Greece? Can she be suffered to approximate to the Mediterranean, known to be filled with her intrigues for years? Can the Nesselrode of Eastern policy be permitted, unchallenged, to pervade the West, with the schemes and reports of all his spies, and intrigues of every grade there for the last fourteen years in his bureau, supplied by the naval Simonichs

and Vicovichs of every British and French possession, the Gouttes, Christians, &c. of civil and mercantile professions? Constantinople once virtually in Russian power, what price must Turkey pay for its extrication? a subsidy, doubtless, for military aid, and then to be released from this by surrender of the north coast-line of Asia Minor, and the LONG and PREGNANT channel of the Euphrates. We may then bid adieu to Circassia, the bulwark of Turkey; to Caucasus, the gate of Persia; and then, with the latter to agitate our Eastern possessions and invade the Affghans, whom we are in reality alienating by our novel claim of imposing a sovereign upon them, India will be to England a drain on her resources for this frantic contest, or more wisely and happily for both parties, the connection between them broken.

We rely upon the faith of Nicholas himself; but who, after recent experience, can rely on his power? Would it not be madness to leave the very means of intrigue in the hands of his ministry and their agents? for they are certainly not those of the emperor. He has behaved on most, if not all occasions, with generosity and forbearance; but his ministers are even now scheming the reverse.—The game of Tehran has been long playing at Constantinople, Smyrna, Cairo, and through the Mediterranean, by a whole Levant-Company of Muscovite Agents; and, were it stopped to-day, it would be renewed to-morrow. The consequence then is obvious. We may respect the emperor, but we cannot confide one instant in Russia.

On this conclusion we must act; and promptly, so soon as occasion requires it. The movement of Russia into Turkey, on whatever pretence, without guarantees, is a hostile movement upon Austria, France, and England. It may be met by all three, or by two, or but one; but it must be met, and crushed at once. Austria has long seen the necessity: France has half confessed it; but England, if she stand alone in the contest, must place herself in its foremost front.

Enough has been shown of patience; enough of temporising and delay. Shall Russia, as in the parable, come into the strong man's house, and bind him first, and then carry off his goods? We repeat it; under whatever circumstances Russia may march her troops into Turkey, it is a violation of European peace; for Turkey must make sacrifices to obtain this aid.

The position of Ibrahim is critical. He must advance or retire. A Turkish army, numerous and well-appointed, and superior in matériel to the former, is in front: the

Pacha of Bagdad is advancing to his right; the Pacha of Marasch on his left; and with the reinforcements now urging in Constantinople, he will have nearly double his force against him, and the hostility of the natives. A bold attack and a probable victory over the army of Hafiz, will extricate him from his embarrassments, but at the expense perhaps of Europe.

We have avowed our little apprehension of the Russian fleets. That of France is far more formidable, and her naval power, by the invention of steam, may bid defiance to the boldest in Europe. On this head she deserves the utmost attention.

The system of large vessels, regular ships of the line, must now be materially altered; and though we undoubtedly ought to keep a force of these equal to anything that might be brought against us so long as the present system is retained by other nations, yet it must undergo modification. Our naval superiority in the last war, for instance, cannot be maintained by the same means: the system of blockade would be impracticable: steamers might at any time tow vessels of war and transports along their own shores if desirable; while vessels of war must be dependent on the wind, and consequently stand out often far to sea. But steamers could not be employed in permanent blockade, from the quantity of fuel they require, and the little scope they afford for movement and space, after allowance for machinery. The fire too increases the danger to the magazine. But though inefficient for a blockade, they would be of infinite service against it; for a single steamer might issue from a blockaded port at night, in fair weather towing gun-boats, and bearing a gun or mortar-cannon carrying a shell of sixty-eight pounds. Against this assault a ship of the line could offer little defence; for as the steamer lies low in the water she would scarcely afford a mark, while the high hull and tall masts of her antagonist would offer a target for every shot.

As proofs of the destructiveness of the new system, we extract from the reports of two experiments made at Brest, with M. Paixhans' Mortar-cannon, on the *Pacificateur* of 80 guns, some years since. It is stated that

"Whatever ideas might have been formed of the effects of this arm, those which have been obtained have surpassed them: that the discharges have produced in the line-of-battle ship a destruction and ravage which would certainly have prevented her from continuing the action, and perhaps led to her immediate ruin; that extremely remarkable ranges were obtained; that the results so surprising, might

serve greatly to modify, in extending its effects, the use of artillery by sea and land; that M. Paixhans is highly praiseworthy for having introduced them, and that he cannot be too much congratulated; that experience has confirmed his theory; that if such effects have been produced with an 80-pounder gun, one can hardly imagine those which might be produced by 150-pounder guns, which M. Paixhans equally proposed."

'The Report terminates thus:—"From this time, your Committee is unanimous on the immense advantages which would be produced by the adoption of this species of ordnance, which, employed for the defence of coasts, in gunboats, floating batteries, at the entrance of roadsteads, &c., would render impossible the success of any enterprize attempted against them by a squadron, whatever might be its force. Your Committee is equally convinced that through new experiments on the use of this arm on board ships of the line, we may arrive, either by the different arrangement of which its fitting is susceptible, or by modification of the construction of the vessels themselves, at bringing this gun into use without danger, of which the effects would evidently be to establish a sort of equilibrium—between vessels of different sorts and different sizes—a result which would be all to the advantage of the power which had the fewest great ships of the line, and the largest population, *and consequently to the advantage of France over England.*"

We extract from the second Report as follows:—

"The Commission, which twice assured itself by personal inspection of the prodigious damage done on board the *Pacificateur* by the shells, has, after a full discussion, formed the opinion that the Paixhans cannon can throw shells horizontally, or at the same angle as ordinary guns.

"That the effect of them is so terrible that it would probably suffice for one or two shells of this kind to burst between the decks of a ship, to compromise the defence of the vessel attacked.

"That these shells may produce by their force and explosion among the timbers, if they should burst there, a degree of damage, which if it took place at the water-line, would expose a line-of-battle ship to be sunk, of which a judgment might be formed from the effect of the shell No. 8, which if it had taken place at the water-line had compromised the safety of the ship, &c.

"Respecting the question of admitting mortar-cannon into ships of the line, the Commission, considering the danger and difficulty of employing at once too great a number of loaded hollow projectiles, 'does not think that the battery of a line-of-battle ship ought to be wholly armed with them; but it is nearly unanimous that two or four of these guns might be placed in the lower battery, especially at one of the extremities, with the precaution of having a store room apart for the shells.' For the rest upon this

point the Commission thinks, 'that it would be convenient before the adoption of this arm on board ships of the line to have experiments made upon them at sea, recommending that the trials should be made under all circumstances, &c.'

"And as to the use of *mortar-cannon* in other vessels than ships of the line, as well as upon the coast, &c., the Commission were unanimously satisfied, 'that this arm would have a marvellous effect in coast batteries. No ship, whatever might be its force, if it was

from 300 to 600 fathoms distant, could stand against such a battery; that it would be very advantageous to arm with this new artillery, either floating batteries, or gun-boats, or vessels, or *steam-vessels*; and it is of opinion that for the defence of roadsteads, coasts, or attack of line-of-battle ships becalmed or embayed, the success of *mortar-cannon* would be infallible."

These matters have not yet come sufficiently before the British public at large.

MUSIC ABROAD AND AT HOME.

CANTON.—The Rev. M. Mantari, a missionary, who is about proceeding to China, intends devoting a portion of his leisure to collecting Ancient Chinese Melodies and Tracts upon Music. It has long been suspected, that in their Dramas the germ of our modern Italian Opera is to be found.

"The Chinese plays are intermixed with songs, in the middle of which the actors often stop to speak a sentence or two, in the common tone of declamation. On the other hand, it appears shocking to us for an actor, in the middle of a dialogue, all of a sudden to commence singing; but we ought to consider, that among the Chinese, singing is used to express some great emotion of the soul—as joy, grief, anger, despair; a man, for example, who is moved with indignation against a villain, sings; another, who animates himself to revenge, sings; a third, who is going to put himself to death, sings likewise." The same rude elements of this union of poetry, music and action, are also found in Java.

CONSTANTINOPLE.—The Sultan, Mahmoud, has recently given a Concert to the ladies of his Harem, at which a young Turk, who has received his musical education at Paris, played (among other pieces) one of Beethoven's Sonatas, which enraptured the assembly, and drew down thunders of applause.

VENICE.—The Operatic Company at the *Teatro di Chioggia*, has been increased by a young lady of the name of *Margherita Palidori*, who has been received with great success. The fair debutante has a rich soprano voice, combined with the purest style of expressing the noble and the animated

passions of nature, and which must speedily place her on the list of our most distinguished singers.

LEVANTO.—M. Antonio Taddei, the author of the new musical farce, "*Amazilia*," which found so much favour, has another musical production in preparation.

VIENNA.—The Gelehrte Gesellschaft have offered a prize of 100 ducats (£47,) for the best Tragedy, and the same amount for the most successful Comedy. Thirteen persons have already entered their names as competitors for the tragic prize. Thirty-nine *original* pieces were produced during the past year at the national theatres. The Viennese have been delighted with the performances of Louis Lacombe, the celebrated French pianist.

DUSSELDORF.—Mendelssohn presided at the Festival on the first day of Whitsuntide. The performances were the Messiah and the Second Psalm, with Mendelssohn's heroic Symphony.

MONS.—This town has recently offered a very novel contest, and has invited all the Musical Societies of the cities of France, those of the villages, and some of foreign countries. The cities are to contest for the most perfect performance of an overture or Symphony, a Thema with variations, and a favourite piece; and are to be divided into two classes, those having upwards of 18,000 inhabitants to contest for a medal worth 400 francs, and the cities below that number for a medal worth 300 francs. The villages are to be divided into two classes, and are to contest for the most perfect performance of a March, a Waltz, and a favourite piece. The first prize, a medal worth 300 francs,

and the second to be worth 125 francs. It is exciting great interest in all the small towns of the province.

BERLIN.—Wieprecht and Skorri, the instrument makers, have jointly taken out a patent for ten years, for improvements in the Bass instrument Batyphon.

LUBECK.—*Handel in Germany*.—It must be truly gratifying to the admirers of this giant genius to learn that his fatherland has produced some of his greatest works, on a scale of magnificence that would content the immortal composer himself, were he now living. A grand Music Festival took place at Lubeck, on the 26th, 27th, and 28th of June last. The first day's performance, in St. Mary's Church, consisted of "*Samson*," on the second, Vocal and Instrumental Selections, in the Hall of the Exchange; and on the third, Chorusses from the "*Messiah*," with Beethoven's C Minor Symphony, executed by three hundred and fifty performers.

LINZ.—This town possesses the largest organ in Germany, or perhaps in Europe.

DRESDEN.—A new Opera, entitled "*Alidida*," by Lachner, Chapel Master to the King of Saxony, was produced here lately, and met with a reception unsurpassed since the appearance of the "*Freyschütz*." The subject of the piece, written by the Princess Amelia of Saxony, is taken from Bulwer's Romance, "*The Last Days of Pompeii*." Such was the enthusiasm of the audience, that the composer was called for at the end of the first and second act, and *five times* after the falling of the curtain. Lachner is only known in this country by one of his symphonies, which has been performed at the Philharmonic Concert.

Her Royal Highness the Princess Amelia of Saxony, has just produced the *libretto* of an opera in two acts, entitled "*La Novella Sposa*," the poetry of which has been highly spoken of. The music is by Signor Giano Rastrelli, a Sicilian composer of celebrity, and we understand that the reception of the *ensemble* at the theatre of the court was triumphant.

BRUSSELS.—A Society has been formed at Brussels, under the title *Société musicale Belge*, with a fund of 200,000 guilders, and are employed in the publication of musical compositions, particularly the works of Belgian composers, with due care to economy in the sale prices. They also intend publishing a newspaper, to be entitled *La Belgique musicale*.

The opinions of foreigners respecting our habits and feelings are always interesting:—A humorous writer in the *Morgenblatt*, says, "In England there is nothing mere fashion, it is all mania. Last year the ma-

nia was Asphaltic, right and left; from sunrise till sun-set nothing was talked of but Asphaltic. The companies for this article were innumerable; the very world was to be paved with it. But Asphaltic is no longer heard, except as a thing for coachmen to grumble at. This year they have a mania of another character, a noble mania, a cheap mania, a concert à la Musard mania. No wonder their managers of theatres should fly from the charge, as the theatrical taste seems daily to be losing favour."

MESSINA.—We have here a young composer who promises to become a rival of Bellini. His name is Laudano. He has produced an Opera, entitled "*Ettore Fieramosca*," the libretto by Gazzoletti, with the most decided success. His style is that of true music—graceful and touching melody, constructed upon the purest and most scientific harmony.

CASSEL.—It is stated that Spohr will leave Germany in August, to attend the Norwich festival in England.

GENOA.—A new and extraordinary exhibition has taken place here, at the theatre Gagudetti. The principal pupils of the Deaf and Dumb Institution represented Monti's tragedy, *Aristodemo*, with the greatest success! When will wonders cease? The representation was for the benefit of the poor.

NAPLES.—Mlle. Meguillet, a pupil of Nourrit's, an established favourite of the Parisian public, has made a successful *debut* here, in Donizetti's opera, *Belisario*.

PIEDMONT.—A young pianist, Holbein by name, and a descendant of the great painter, is staying here, engaged in the composition of Studies for the Piano Forte, in which he introduces novel effects of the most extraordinary kind.

COPENHAGEN.—The Musical Society in this town now contains upwards of 1300 members; they have recently given five grand concerts, which were exceedingly well attended. They have also revived the Danish opera of "*Floribella*," by Weyse, and have produced the operas of "*Hugo and Adelheid*," by Kuhlau, and "*Der Rabe*" (the Raven), by Hartmann. They also recently offered a prize of 20 ducats (9*l.* 10*s.*) for a collection of six Danish Songs; forty-three collections were delivered in, but none were selected. The society ultimately awarded prizes of three ducats for nine single songs; of these four were by Hartmann, one by Rung, one Gebauer, one Helsted, and two others.

The celebrated tenor singer to the King, Siboni, we regret to say is dead.

PRAGUE.—Bellini's opera, "*Norma*," has

been translated into Bohemian, and has been drawing crowded houses. Mrs. Alfred Shaw, from London, gave a concert, and afterwards sang at the theatre with considerable applause.

ZWEIBRUCKEN.—On the 20th June the musical festival took place in this town; the orchestra consisted of upwards of 600 performers. The *Messiah* was the first day's performance.

BERLIN.—Tichatscheck, tenor singer to the King of Saxony, has now completed his engagements in this town; he is represented to have ALL the requisites of a theatrical singer. The principal characters he has sustained have been *Sever*, in *Norma*, *Adolar*, in *Euryanthe*, and *Arthur*, in *Il Puritani*.

ST. PETERSBURG.—*Thalberg*.—By letters just arrived from Russia, we learn that Thalberg has indeed been winning "golden opinions," for they state that the product of only four concerts was not less than two thousand pounds. He also, we are told, played twice before the Emperor, from which it would seem that the autocrat and his subjects are equally alive to the charms of true music. The sensation produced by his new Fantasia, on Themes from "*La Donna del Lago*," could only have been caused by the author of his last masterly work, the Fantasia from "*Mosé in Egitto*." M. Thalberg arrived in Moscow early in April, intending to make but a short stay; subsequently to which, we are happy to announce, he will proceed to visit and delight us once more in London about the middle of June.

Some of the old Russ. MSS. contain certain proofs that Music (before the time of Guido's invention of the gamut) was in a flourishing state in that country; for, first, there are no lines; second, the characters are entirely different from any used since the time of Guido. The tones now used in the Church of Russia are modern; they are written on modern music paper, in five lines in the treble cleff, whereas, in the Ambrosian and Gregorian, never more than four lines were used, and the cleff is either the tenor or bass. There seems to be little doubt that the ancient Russ. music is derived from the eastern nations.—(See Art. *Russian Literature, Foreign Qua. Review, June, 1827.*) "The Aria parlante is natural to all the languages of the East. The Jews to this day read or chant the Scriptures in a singing tone, the same as Moses read the law upon Mount Sinai. The Koran, and all religious books are chanted throughout India."—See *Gardiner's Music of Nature*, p. 84.

PARIS.—The musical world have to regret the loss of one of the most accomplished composers that has flourished since the days

of Mozart, the Maestro Paër, author of the finest domestic opera (excepting Beethoven's *Fidelio*). Those who are acquainted with his music (and who among the real amateurs are not), need scarcely be reminded that we allude to *Agnese* (Mrs. Opie's Story of *Father and Daughter*). If touching melody, rich and powerful harmony, genuine expression of the words, and clear, scientific, but never overlaid accompaniments, present any pleasure, so beautifully combined as we find them in all Paër's works; then must they continue to live in the estimation of all sound musicians, who will find in them a mine of wealth for study. The celebrated sculptor, Dantan, is executing a bust of this composer for the Institute.

M. Auber has been appointed director of the private band of King Louis Phillippe, which post had become vacant by the decease of Paër. Rossini's new Opera is not yet completed, at least we have heard no tidings of it. We trust that the talented Maestro will take his time, and give us a worthy companion to *Guillaume Tell*.

Scribe has two operas, in one act each, now on hand. Marliani and Benoit are the composers who will set them.

Donizetti has lately written the music to an opera by the same indefatigable author, entitled *Polyeucte*, to be brought out at Paris. John Cramer is staying in the Gallic metropolis; at the last soirée given by the Society of St. Cecilia he contributed his share to the harmony of the evening.

PROVENCE.—Paganini's health appears to be improving, although he still labours under the loss of his voice. His being a nervous complaint, the violin of course is strictly prohibited by the medical attendant. He amuses himself by playing at bowls (*aux boules*) a game he is passionately fond of, and in which he excels.

CALCUTTA.—A very curious and entertaining musical work, entitled "*A Treatise on the Music of Hindostan, by Capt. N. A. Willard, commanding in the service of H.H. the Nuwab of Banda*," was printed here in 1834, but the copy has only just been sent to us. This little work comprises a detail of the ancient theory and modern practice of Indian music, a subject that hitherto has been left at the mercy of writers totally incompetent to form a right judgment upon it. Even the learned musicians (and Dr. Burney among the number) seem to have taken but little interest in the music of the Oriental nations, imagining, from their system of sounds and the few incomplete specimens of their melodies extant in England, that it was mere matter of curiosity rather than utility. But they should have learnt that the music of

Hindustan is identified with the history of that country, that *there* the ancient musicians were not, as now, wandering mendicants of the most degraded caste, but poets and men of erudition, who usually sung their own compositions. In Hindostan music arrived at its greatest height during the flourishing period of the native princes, a short time before the Mahomedan conquest; its subsequent decline (indeed almost total extinction as an art) is a matter of regret to those who are fond of tracing the progress of poetical music. Captain Willard has performed his task with considerable industry, and produced a very sensible and ingenious treatise, which will well repay the perusal.

LONDON.—*Female Musical Society*.—A number of ladies, vocal and instrumental performers, are engaged in forming a society, similar in its objects to the Royal Society of Musicians, with the laudable view of providing for those who may not be fortunate enough to have it in their power to save a sufficient competency before they become no longer able to pursue their professional avocations. As the plan is only yet in embryo, we shall not enter into any particulars, but most heartily do we wish its projectors the greatest success.

The present season at Covent Garden is the last under the able management of Mr. Macready. The public will be losers by the change; for into whatever hands the theatre may fall, it cannot be conducted in a more becoming and gentlemanly manner than while he has held it. The legitimate drama has been upheld, musical novelties produced of a very superior kind, and every thing appears to have been done to purify a series of entertainments which may serve as patterns for Macready's successor. This theatre will pass into the management of Mr. and Mrs. Charles Matthews.

Mr. Rooke's new opera, "*Henrique, or the Love Pilgrim*," after a few nights' representation, was withdrawn, and this occurrence has been of service to the composer's reputation, as he had set himself to write music to the most stupid and confused plot (if plot it could be called), that ever a weary audience was condemned to endure. The performers themselves declared they could not understand it. The composer of "*Amilie*," should really have known better than to waste his energies upon such flimsy materials. The public are not now so play-going mad as to listen to operas where they cannot feel a temporary interest in the characters represented; it is with difficulty they are drawn to the theatres *at all*; it is surely then the interest of every writer, be his talent what it may, to have the opinion of es-

tablished judgment upon both words and music before he rashly ventures upon the ordeal of public exhibition. Look at the great operas of *Fidelio*, *Don Giovanni*, *Guillaume Tell*, *Oberon*, and *Der Freyschütz*, in every one of these (especially the two first and last) the plot is the main spring of the musical ideas, and in developing this, the composer takes a decided interest as his work proceeds.

The Haymarket, under the indefatigable Webster, continues to present us with comedy and tragedy, as perfect as the existing talent can make it; and although the public taste for Opera is too languid to permit the lessee to risk his money in such a hazardous speculation, he has at least the merit of introducing a novel feature in Orcheonic arrangements,—it is by the plan of raising the musicians during the performance of the overture and select pieces, to a level with the stage, by which means the music is heard to greater advantage.

The St. James's Theatre has closed, after an indifferent season, affording the lessee (Mr. Hooper) a useful lesson for the future, viz. that lions and monkeys, although quite in loco in Regent's Park, are not suitable to so beautiful a theatre as the St. James's. It is satisfactory to learn there will be more attention given to the musical department in the ensuing season.

The Lyceum, or English Opera House, has again closed, after two unsuccessful attempts to re-establish the Promenade Concerts *à la Musard*. The signal success which attended these Concerts when conducted by Signior Negri, and aided by Harper, Wiley, Baumann, Richardson, Laurent, and other musicians of the first order, is a convincing proof that nothing short of first-rate talent can succeed here.

Drury Lane has at length been taken for one year by Mr. Blake, from New York, for the sum of 5000*l*.

The Opera season is terminating; and what has M. Laporte done for the admirers of fine music? He has reproduced *Norma*, *La Cenerentola*, *Otello*, *L'Elisir D'Amore*, *Don Giovanni* (for which we are always grateful), and *Figaro*, which disappointed us in the cast. Lablache (great artist as he is) becomes now too ponderous to deceive even a purblind Duchess into the belief that he is representing the volatile Major Domo.—Grisi and Albertazzi are both too heavy for their respective parts; and the everlasting mechanism of Tamburini begins to *pall upon the sense*. Donizetti's last work, "*Lucretia Borgia*," brought out to introduce Signior Mario (who bids fair to become a first-rate tenor), as a composition, is below contempt,

and an insult to the musical feeling of this country. But why should we say this, when all the Arts are suffering under the confusion of political excitement and distraction, the non-patronage of native talent by those whose duty it is to take the lead in fostering it; the mania of fashion which leads people to pay a guinea for *not* being admitted into a Concert Room!"*

"Italian Music's sweet because 'tis dear,
Their *vanity* is tickled, not the ear,
The taste would lessen, if the prices fell,
And Shakspeare's wretched stuff do quite as well."
Young's Satires.

It may not be generally known, that the musicians of London (if they chose to exert the powers confided to them) have a charter, granted by James the First, under the name of "*The Company of the Musicians of London.*" He gave them a coat of arms, azure, a swan argent, within a tressure counterflure or; in a chief gules, a rose between two lions or; and the celestial sign Lyra for a crest. The original intention of the founder of this Company was, that the *regularly instructed* and competent musicians should be enabled to practise their art and profession to the exclusion of ignorant and unskilful pretenders, and in consequence of the neglect of this charter, such hordes of charlatans and impudent pretenders are turned loose upon the public (whose ignorance of the principles of music lays them open to imposture of every kind) that it has become a general remark—there is worse singing now heard in public concert rooms than in private society. The Concert season is terminating, and upon a review of the materials of which the majority of these exhibitions have consisted, we must confess the prospects for the higher classes of the art seem poor indeed. The Ancient Concert has brought forward *nothing!* from its valuable stores of musical works now mouldering on the shelves, worth a moment's recollection. The specimen of *Bach* failed last year; that was sufficient to damp the ardour of the noble director in his vigorous pursuit after musical knowledge. The *Philharmonic* has repeated over the same symphonies (beautiful it must be confessed) that we have heard fifty times over. The only examples of novelty in composition have occurred when solo instrumentalists, Messrs. David, Haumann, Doehler, &c., have played their own pieces, to show off their chief peculiarities; but for these occasionally, and a new singer or two, the subscribers would have been treated to an expensive and oft-repeated concert. The decrease of Mori will probably open the way to

some reform in the choral vocal pieces for the next season, which he is known to have been chiefly instrumental in keeping down, not only at the Philharmonic, but wherever his influence could reach. Indeed, the almost avowed object can hardly be mistaken; the *vocal* pieces have been brought in only as *foils* to the instrumental. The statue is placed where the pedestal should be. The Società Armonica has been more successful this year than usual. The principal Italian singers, including Pauline Garcia, Mad. Dorus, Gras, &c., have been the chief attraction. The Oratorio performances at Exeter Hall still continue; *Joshua*, the *Messiah*, and one or two others, well performed, attract crowded audiences, at the reasonable price of three shillings for admission, that is, when the tickets are not surreptitiously bought up by persons who make large profits by this disreputable tax upon the public purse, which the directors of this society (The Sacred Harmonic) are bound to prevent.

OXFORD Musical Festival commenced on Monday 10th June, and considerable anxiety was exhibited to hear Mr. Bishop's exercise for his degree, which has been conferred upon him at this university, of M. B. (Bachelor of Music). It consisted of portions of the new oratorio, "*The Fallen Angels*;" words from Milton's *Paradise Lost*, with a few quotations from Holy Writ. Phillips, Recit. and Air, "*Nine Times the Space*," and "*Is this the Region?*" are spoken of as equally striking and effective. Mr. Bishop was loudly cheered from all parts of the theatre, at the conclusion of the exercise. There was no other novelty, save Ivanhoff's "*Nobis Omnipotentia*."

EDINBURGH.—On the 6th June, "*The Messiah*" was performed by native musicians, under the management of Mr. Wilkinson, which, allowing for all the difficulties of keeping down the accompaniments, and balancing well the chorus voices, was an undertaking deserving great praise.

Scarce Books on Music, which Dr. Callcot mentions at page 334 of his *Grammar*, but never could find them.

Roma, 1781.

Any information respecting either of the above works will oblige the writer of this notice, directed to the care of Messrs. Black and Armstrong.

We quote the following observations from an elaborate review of Mr. Dauney's "Ancient Scottish Melodies, from a MS. of the reign of King James VI., with an Inquiry illustrative of the History of the Music of Scotland," which appeared in the *Allgemeine Musikalische Zeitung* (Nos. 14 and 15 for April last.) It is interesting to us at all times to know the opinions of enlightened foreigners with respect to our national music, and the review from which we make this extract is the production of Dr. G. W. Fink, the learned editor of the *Leipsic Musical Gazette*, and author of a work entitled "*Erste Wanderung der ältesten Tonkunst*," which contains an account of the ancient music of the Caledonians.

"This work (of Mr. Dauney) is in many respects most attractive to all friends of musical history; and the Skene MS. itself has the highest claims on our regard, not merely as the best substitute for something better, but on its own account. At the same time we cannot conceal from ourselves the fact that this MS. belongs to an age when the genuine ancient Caledonian music, especially in the Lowlands, had become subjected to the most manifold influence of modern science. Proof of this meets us in every page of the present publication. In their relation to the present day, these melodies have been denominated '*Ancient Scottish*,' but in reference to their historical character, as a spiritual development of the Caledonian people, they might more properly be designated '*New Scottish*.' The editors themselves admit this. Modern European music, sacred and profane has, according to them, exercised from time to time the most undeniable influence on the original Scottish melodies—a result, indeed, which from the state of society was altogether unavoidable, and which is here sufficiently apparent, whether we look at the conduct of the melody or the harmonic accompaniment, however scanty. Not only does the diatonic element of a scale enriched with the *fourth* and *seventh* peep out everywhere, but it is impossible not to perceive that this more modern scale has attained a sort of triumph over the original Scottish. With all this, however, the impress is everywhere visible of a patriarchal character altogether different from the more regulated productions of a spirit of reformation which in modern

times has extended itself to the very sphere of human activity; so decided is this character, that were we possessed of no more ancient musical documents than these, even out of them we should be in a condition to reconstruct the elements of a national music strong in its luxuriance; and though in some respects certainly more narrow, in other respects as certainly more free and unfettered than the music of the present day. To this patriarchal simplicity, this strong natural breadth and freedom, combined with a wise and economic natural limitation, we are to ascribe the preservation of that gigantic and hardy spirit, which delighted with honest and heartfelt content to celebrate the deeds of noble sires upon mossy stones and in the halls of the lances.

"That this preservation of the antique character cannot be altogether ascribed to the fostering care of subsequent culture, the Skene MS. itself is sufficient evidence; as the melodies which it presents belong to an age when the fashion of the court and nobles, and especially the clergy, tended rather to swamp native melody by an inundation of foreign science, than to cherish it in its original purity. Yet, whether from natural partiality, or from motives of policy, the influential men of those times continued still to have the native Scottish music taught in the schools,—and the composers of the same period, familiar as they were with the diatonic scale, and the harmony built upon it, could never altogether rob their ear of its native echoes,—their original scale makes itself everywhere audible, and whenever a strong feeling is to be expressed, it is always most apt to reassume its original supremacy.

"How difficult it was for the Scotch to unite the new diatonic scale with their original scale, is farther proved by the awkwardness with which they use it, and the scantiness of their harmonic accompaniments, which were often nothing more than a duplication of the octave. The compositions of foreigners can be distinguished from the native Scottish at a single glance. Examples of the intermixture of old and new, and the singular effects thereby produced, may be dispensed with after all that has been said and written on the subject. It suffices to say, that the famous second sight of the Scotch reveals itself also in these melodies, so far as they are native; and we perceive that even the Christian Scotland cannot forget its old predilection for the misty shapes that ride amid the storm on the skirts of shining clouds. If this be the case even with the music of the Lowlands, how much better must it hold with respect to the Highlands, in their more complete separation from foreign European influences? He who wishes to become acquainted with the ancient Scottish music in its original purity, must collect it in the

remote rock-bound Western Isles, where neither tree nor gold is to be found, and from the living mouth of the people. Here the very nature of the thing necessarily indicates much room for research; and from this may be expected results at once corroborative of truths already known, and opening up new views as to the nature of a national music which is alike valuable for what it was as a means of enjoyment to the past, and for what it is as the *matrix* or *substratum* of the present. Such investigations would not alone profit Scotland; the essential laws of the music of the old world would be laid open, and in a part of the world which, next to China and Hindostan, is remarkable for the fidelity with which it has preserved the remains of musical art. What educated person is there to whom such researches would not be interesting?

"To those who would set out as navigators in this promising sea of discovery, we would especially recommend attention to the construction of musical instruments, and especially of the wire-stringed harp.

We desiderate a minute description of their formation, the number of their strings, and (wherever the latter instrument was used) the mode in which it was tuned as regarded compass, and the series of intervals employed. With respect also to the highland bagpipe, we should wish to see a specification not only of the ventages of the pipes and the succession of their sounds, but of the number and tune of the drones; as by this not a little light might thus be thrown on the early introduction and growth of harmony, and especially on the introduction of the third as a harmonically applied tone, which it was not in more ancient times. Farther we would direct particular attention, not merely to melody and rhythm, (which last must not be forced into accordance with our modern fashionable varieties of time) but also to the popular texts of the songs; and among these particularly to such as yield historical names or describe manners, from which the age of the melody may with probability be ascertained."

MISCELLANEOUS LITERARY NOTICES.

FRANCE.

The first number of a highly humorous work, entitled *les Français, Mœurs Contemporaines*, has just appeared; it will be complete in 48 numbers 8vo., and embellished with numerous amusing plates.

Didot brothers have just issued the three first numbers of a very beautiful work by M. Silvestre, entitled *Paléographie Universelle*, being a collection of autographs (*fac-simile d'écritures*) of all people and all times, drawn from the most authentic documents, charters, and manuscripts in the archives and libraries of France, Italy, England and Germany, and accompanied with historical explanations; it will form two folio volumes, and will appear in 50 numbers, each containing six beautifully coloured plates. Only 200 copies of this expensive work will be printed.

Bourdin & Co. have in preparation, *Voyage dans la Russie Meridionale et la Crimée*, executed in 1837 under the direction of M. de Demidoff. The work will be embellished with 80 beautiful lithographic views by Raffet, viz. seven in Hungary, nine in Wallachia, five in Moldavia, seven in Bessarabia, twelve of the camp of Vossensk, and forty in the Crimea, and will appear in monthly numbers, each containing six plates on India paper. To this will be appended the *Observations Scientifiques*, phrenological, geological, mineralogical, botanical and zoological, forming three volumes, with an atlas and 80 coloured plates, in addition to which the *Histoire du Voyage* will form a distinct volume 8vo. and be illustrated with 64 vignettes; the first number has already appeared.

The Polish refugees have formed a Library in Paris of Polish works, supported by Count Laskyrie and several distinguished foreigners. Dufart, the Parisian bookseller, has given them 180 volumes,

and several contributions of money have been made. On the occasion of opening it, the following interesting particulars were elucidated. The Russian Libraries consist principally of Polish books, and the Royal Library at St. Petersburg has been formed almost entirely by the plunder of Polish libraries. Peter the First took from the town of Mitau, in 1704, 2500 volumes, which were the foundation of the St. Petersburg Library; again, in 1795, the Zaluski Library was taken from Warsaw to St. Petersburg, and contained, according to the Russian estimate, 260,000 volumes, and 11,000 manuscripts. Upon the taking of Warsaw in 1831, the University lost 200,000 volumes, the Philomathic Society 20,000, the Library of the town council 36,000, and the private Library of Prince Czartoryski in Pulawy, containing 15,000 volumes; adding to these the bibliographical treasures of the convents, we have a total of 700,000 volumes taken from Poland to Russia.

It is also singular that the Zaluski Library, which contained, before the disturbances broke out which led to its removal, 400,000 volumes, was commenced in France under similar circumstances.

The French Chambers have ultimately agreed that the right of publication to authors shall continue for their families until 30 years after their decease.

M. de Villemarque is busily engaged in arranging the valuable information he collected in Wales, in the native Welsh language, for the work with which the French government have entrusted him, "*History of the French Literature in the Middle Ages.*"

Madame Victoire Babois, the oldest of the French poetesses, died recently at Paris. Her *Elegies* were greatly admired, and ran through three editions in a short time; being principally national, they have

rendered her name familiar throughout France.

Ciceri, the celebrated Decorative Painter, has discovered a means of fixing colours in stone; he can imitate marble, or paint subjects on the natural stone. The colour becomes so engrafted into the pores of the stone, that it may be ground or polished without injuring any of the colours.

At the king's printing-office in Paris they are busily engaged in preparing for publication several highly important translations of Oriental Manuscripts. They will appear in the following order:—The History of Mangolen by Raschid-Eddin, translated by Quatremère; Bhagaratu Purana, by Burnouf; Schah Nameh, translated by J. Mohl; and the Book of Laws of King Wakhtun. They are to be followed by works in Arabic, Persian, Georgic, &c., and embellished with vignettes in the oriental style.

ITALY.

A newspaper for the blind has lately been published at Palermo; the letters are in relief and are read by the blind passing their fingers over the lines; it is entitled *Il Consolatore dei Ciechi*.

A great want of retail booksellers exists in Italy; at Rome the usual method of selling books is by auction, and these have been so frequent during the winter that three have on some occasions taken place on the same day. These auctions are held in the bookseller's shop in the morning, the books being ranged according to their numbers on a table in the centre of a room. Here buyers and amateurs resort to make acquaintances and gossip away the time, every accommodation being given by seats ranged round the walls, and any book may be chosen and read previous to the auction commencing. The Italians are great lovers of books, and select the finest editions and the most choice bindings. The libraries have but a small stock, and that consists principally of theological and philological works.

One of the most stupendous works of modern times is a projected rail-road from Venice to Milan, connecting the seven richest and most populous cities of Italy with each other, Venice, Padua, Vicenza, Verona, Mantua, Brescia and Milan; the most gigantic portion will be the bridge over the Lagumen, connecting Venice with the main land. The length of the rail-road will be 166 Italian (about the same in English) miles, passing through a population of three and a half millions, the seven cities having alone a population of half a million, viz. Venice, 120,000, Padua, 44,000, Vicenza, 50,000, Verona, 46,000, Mantua, 34,000, Brescia, 42,000, and Milan, 180,000 inhabitants, to which may be added 20,000 foreigners in Venice and Milan. It is cal-

culated the transport, when completed, will average 1800 persons, 1500 tons of goods, and 1000 tons of coals daily.

The Grand Duke of Tuscany has recently purchased the fine collection of Tuscan minerals belonging to the celebrated Museum of Michael Targioni for his cabinet of physics and natural history. This collection was first commenced by Antonio Micheli, the Italian botanist, and increased to its present richness by Dr. Giovanni Targioni.

GERMANY.

The new number of the *Deutsche Vierteljahr's Schrift*, contains articles—On the State of the German Universities—on Swiss Nationality, social and political—on the National Peculiarities of English, French and German Aphorisms—the Contest between Morals and Taste—the American People past and future, and several minor articles.

A new edition of "Gulliver's Reisen" by Swift, and translated by Dr. F. Kottenkamp, is in the course of publication in two volumes 8vo., and embellished with 450 wood cuts; it will be delivered in eight parts at 2s. 6d. each, or 18s. when complete.

A translation of "Murchison's Silurian System of Rocks," will shortly be published at Weimar.

Carl Bernhard, the talented novel writer, has just published in Danish and in German, a novel in one volume 8vo. entitled *Das Glückskind*, which promises to meet with every success.

A subscription is in progress at Breslau, to erect a monument to Frederick the Great—it is to be of bronze, and placed on a pedestal of granite in the *Königplatz* of that town.

Moritz Retzsch's new work will contain *Outlines to Bürgers Leonora Des Pharrer's Tochter von Taubenheim*, and *Das Lied von Braven Manne*; they will appear early in August.

A theoretical and practical work on Lithography, by Engelmann of Mühlhausen, is in the press; it is the fruit of more than twenty years' experience, and will appear in five parts, comprising the history and progress of the art.

The following particulars respecting Charlotte and Werther, the subjects of Goethe's beautiful tale, have recently been published in an obscure newspaper circulating through the Rhine provinces.

Charlotte was the daughter of Amtmann, (Bailliff) Buff, and was by no means of uncommon beauty, but was esteemed by the whole city for the meritorious manner in which she conducted her father's household, and fulfilled the arduous duties of a

mother towards her younger sisters Werther, who shot himself through despair because Charlotte was betrothed to Counsellor Kestner in 1772, was also much esteemed and respected by the citizens of Wetzlar. About the year 1766 it became customary to make a pilgrimage on a certain evening to Werther's grave. A procession was formed, consisting not merely of young people but of men of high rank, assessors of the council, and ladies of high station; these proceeded at midnight to the churchyard, each carrying a wax light and dressed in black, with black crape before the face. Arrived at the grave they formed a circle round it and sang the hymn "*Ausgelitten has du ausgerungen*;" when this was concluded, some one stepped forward and entered into a detail of the life and virtues of the deceased; which was invariably closed with these words:—"The voluntary end of life for love, if not justified, may yet be excused." Flowers were thrown on the grave and the procession returned to the city. The magistrates, after a few years, interfered and forbade this ceremony.

RUSSIA.

An Ukase has been issued at St. Petersburg to suppress the wandering habits of gipsies in the Russian dominions. They are enjoined to provide themselves with fixed habitations before the 1st of January, 1841.

DENMARK.

The new botanical work by Drejer, entitled *Flora excursoria Hafniensis*, has been completed with great care and attention, and must prove highly interesting to the botanist—that portion denominated "*Seeland's Flora*" is much spoken of.

EGYPT.

Two young Chinese priests, born near Peking, and an Italian Clergyman who spoke their language, passed recently through Cairo (21st ult.) on their way to China from Naples, where they had resided long and been ordained.

The Pacha's printing establishment have just issued a work, entitled *Agharal Badiet fi Ilm al Thabiet*; it is on Physics, for the use of schools, and will be shortly followed by others of a like character. The complete edition of the *Thousand and One Nights*, published recently in two 4to. volumes, is from the pen of Abdurrahman al Safti al Scharkawi, and is considered to be free from errors. It is on good Italian paper, but wretchedly printed, although somewhat better than the former works issued from this establishment, but certainly not so perfect as

they print in Constantinople and Tauris. When the Pacha first ordered Lectures to be given on Mathematical knowledge in the school of Abu Zabel, the scholars being mostly Turks, the discourse was given in that language. Several translations into Turkish also appeared from the printing establishment at Bulak, Turkish hand-books were issued on military and mathematical knowledge, the statistics of Bossul were also printed in Turkish by command of the minister, Edhem Bey. But the Arabian race have been gradually increasing in numbers and influence until it gained the ascendancy, and within these few years Chemistry has been taught for the first time in Arabic. The translator, Professor Perron, is a talented Frenchman, and has had a great outcry to withstand, for having engrafted French words in cases where no Arabic could be found.

MISCELLANEOUS.

Faust is a work so full of marvellous imagery that it is exceedingly difficult for translators to give that peculiar felicity of expression and terseness of style, which characterise the original. Hence it is that although we have seven English translations, another has entered the public field, in English verse, from the pen of J. Birch, Esq. throwing new light on the original text, and appearing in a brighter garb, for the volume is embellished by twenty-nine beautiful etchings after Moritz Retzsch.

The Oriental Translation Committee have published a very elaborate translation of the *Akhl-ak-i-Jalaly*, with references and very copious notes by W. F. Thompson, Esq. This beautiful work contains a perfect development of the moral and practical philosophy of the East. It is a work of the 14th century, and contains an able analysis of the three states into which it is divided,—the individual, the domestic and the political states. The Committee have also in the press, *The Divan of the Huzailis*, translated by Professor Kosegarten, and accompanied with Arabic text; the *Khatai Nameh*, translated by Dr. Fleischer, with the original text; *The Vishnu Purana*, translated by Professor Wilson, and *The History of Spain under the Arabs*, by Ahmed Ibn Muhammad Al-makári, translated from the Arabic by Señor P. de Gayangoz.

An elaborate work on the political and religious condition of America, has been published by Mr. Colburn. It is entitled, *a Voice from America to England*, and is from the pen of an American gentleman.

J. C. Symons, Esq. has published an interesting little volume on the *Arts and Artisans at Home and Abroad*, containing some very valuable statistical information.

LIST OF THE PRINCIPAL NEW WORKS

PUBLISHED ON THE CONTINENT.

FROM APRIL TO JUNE, 1839, INCLUSIVE.

THEOLOGY AND ECCLESIASTICAL LITERATURE.

- Ammon, von, Die gemischten Ehen, namentlich der Katholiken und Protestanten nach den Ansichten des Christenthums, der Geschichte des Rechtes und der Sittlichkeit. 8vo. Dresden. 5s.
- Baumgarten, M., De fide libri Estheræ; commentatio historico-critica. 8vo. Halle. 3s.
- Baur, S., Religiöse Betrachtungen und Gebete am Morgen und Abend alle Tage des Jahres. 2 vols. 8vo. Sulzb. 9s.
- Biblia hebraica, secundum editiones, J. Athiæ, J. Leusden, J. Simonis aliorumque, imprimis E. van der Hooght, addidit A. Hahn. 4th Ed. 8vo. Lips. 17s 6d.
- Bibliotheca ecclesiastica quam moderante D. A. Neandro, adornavit H. T. Bruns. Vol. I. Canones apostolorum et conciliorum. 8vo. Berlin. 5s.
- Danz, J. T., Initia doctrinae patristicae introductionis instar in patrum ecclesiae studium. 8vo. Jena. 2s 6d.
- Danz, Universal Wörterbuch der theologischen und religions-geschichtlichen Literatur. Pt. 5. 4to. Leipz. 3s.
- Das Morgenland altes und neues für Freunde der heiligen Schrift—eine Monatschrift. 12 parts. 8vo. Basel. 7s.
- Delitzsch, F., Lutherthum und Lügenthum. Ein offnes Bekenntniss beim Reformationsjubiläum der Stadt Leipzig. 12mo. Leipz. 2s.
- Dietrich, F., De sermonis chaldaici proprietate. 8vo. Leipz. 1s.
- Eusebius, Kirchengeschichte, mit Anmerkungen v. A. Closs. 8vo. Stuttgart. Subscription price 2s 6d.
- Guerike, H. E. F. Allgemeine christliche Symbolik. 8vo. Leipz. 11s 6d.
- Hengel, W. A. van, Commentarius perpetuus in epistola n Pauli ad Philippenses. 8vo. Leyden. 13s.
- Nitzsch, C. J., System der christlichen Lehre. 4th Ed. 8vo. Bonn. 9s.
- Offenbach, J., Allgemeines Gebetbuch für die Israelitische Jugend. Hebräisch und Deutsch. 8vo. Cologne. 1s 6d.
- Patrum apostolicorum opera. Textum ex editionibus præstantissimis repetitum recognovit, brevi adnotatione instruxit, et in usum praelectionum academicarum ed. C. J. Hefele. 8vo. Tübingen. 6s 6d.
- Reichel, V., Introductio in hermeneuticam biblicam. 8vo. Vienna. 3s.
- Rückert, F., Leben Jesu, Evangelien-Harmonie in gebundner Rede. 8vo. Stuttg. 7s.
- Santo Domingo.—Esprit des papes. (Dédié au roi de Prusse.) 8vo. Paris. 7s 6d.
- Schmalz, M. F., Das menschliche Leben im Lichte der evangelischen Geschichte. Vol. IV. 8vo. Hamb. Price of the 4 vols. 12s.
- Strauss, Dr., Vie de Jésus, ou Examen critique de son histoire, traduite par E. Littré. Vol. I. 8vo. Paris. 7s.
- Strauss, Dr. D. F., Zwei friedliche Blätter. 8vo. Altona. 4s 6d.
- The New Testament in the Russian Language. 8vo. Leipz. 6s.
- Theologische Quartalschrift. 4 Parts. 8vo. Tubing. 14s 6d.
- Tholuck, A., Vermischte Schriften. Part I. 8vo. Hamb. 10s.
- Wette, W., Kurzgefasstes exegetisches Handbuch zum neuen Testament. Vol. I. Part II. 8vo. Leipz. 3s 6d.
- Xavier, Die Briefe des Grossen Indianer Apostles des heiligen Franz von Xavier. Vol. II. 8vo. Neuweid. 2s.
- Zeitschrift für die historische Theologie, von C. F. Illgen. 1839. 4 parts. 8vo. Leipz. 1l.
- Zell, G., Acta Antihermesiana, quibus acta

Hermesiana, Meletemata theologica, Actaque Romana. 8vo. Ratisb. 4s 6d.

LAW, JURISPRUDENCE, AND STATISTICS.

- Assises du royaume de Jérusalem, textes français et italien, conférées entre elles ainsi qu'avec les lois des Francs, publiées sur un manuscrit tiré de la bibliothèque de Saint Marc de Venise; par M. Victor Foucher. Vol. I. Part I. 8vo. Paris. 6s.
- Dirksen, H. E., Manuale latinitatis fontium juris civilis Romanorum thesauri latinitatis epitome. Part VIII. 4to. Berlin. 6s.
- Eichstadius, H. C. A., De jurisconsultorum atque philologorum discordi saepe concordia quaedam adiecit. 4to. Jena. 1s.
- Gratier, de, Commentaire sur les lois de la presse et des autres moyens de publication. Vols. I. and II. 8vo. Paris. 9s each volume.
- Les Crimes des rois de France, depuis le commencement de la monarchie jusqu'à Charles X. inclusivement. 8vo. Paris. 9s.
- Monge, G., Traité élémentaire de statique. 8th Ed. 8vo. Brux. 3s.
- Novus Codex diplomaticus Brandenburgensis. Vol. I. Part II. von A. F. Riedel. 4to. Berlin. 7s.
- Schubert, F. W., Handbuch der Allgemeinen Staatskunde von Europa. Vol. I. Part IV. 8vo. Königsb. 17s. Vol. I. 4 parts. 2l 10s.
- Staatslexikon oder Encyclopädie der Staatswissenschaften, von C. v. Rotteck und C. Welcher. Vol. VIII. 8vo. Altona. Sub. price 2s 6d.
- Zimmermann, G., Die Hannöversche Regierung und das Staats-Grundgesetz von 1833. 8vo. Hanover. 2s 6d.

PHILOSOPHY AND HISTORY OF LITERATURE.

- Deutsche Volksbücher. Vol. I. Solomon und Morolf von K. Simrock. 8vo. with woodcuts. Berlin. 1s.
- Huber, V. A., Die englischen Universitäten. Eine Vorarbeit zur englischen Literaturgeschichte. Vol. I. Cassel. 10s 6d.
- Jäger, Handbuch der Logik. 8vo. Vienna. 3s 6d.
- Koch, J. F., Die preussischen Universitäten. Vol. I. 8vo. Berlin. 17s.
- Marmier, Histoire de la littérature en Danemarck et en Suède. 8vo. Paris. 9s.
- Quérard, La France littéraire, ou Dictionnaire bibliographique des savans. Part XVIII. 8vo. Paris. 9s.
- Schmidt, E., Umriss zur Geschichte der Philosophie. 8vo. Berlin. 6s 6d.
- Vinet, A., Littérature de l'enfance. 3d Ed. 8vo. Strasb. 5s.
- Wendel, Beurtheilung der Hegelischen Philosophie nach ihren neueren Erklärern, Mager und Chalybaus. 8vo. Coburg. 1s 6d.

MEDICAL AND NATURAL SCIENCES, PHYSICS AND CHEMISTRY.

- Ausführliche Encyclopädie der gesammten Staatsarzneykunde. Im Verein mit mehreren Doctoren der Rechtsgelehrtheit der Philosophie v. G. F. Most. Part VIII. 8vo. Leipz. 4s 6d.

- Berzelius, J., Jahresbericht über die Fortschritte der physischen Wissenschaften. Part I. Physik unorganische Chemie, und Mineralogie. 8vo. Tübingen. 5s 6d.
- Berzelius, Lehrbuch der Chemie, aus dem schwedischen von F. Wöhler. 4th Ed. Vol. VIII. 8vo. Dresden. 3s 6d.
- Brandis, Nosologie und Therapie der Cachexien. Vol. II. 8vo. Berlin. 10s 6d.
- Desvaux, Traité général de botanique. Vol. I. Pts. 1 & 2. 8vo. Paris. 14s 6d.
- Endlicher, Genera plantarum secundum ordines naturales disposita. No. X. 4to. Vienna. Sub. pr. 5s.
- Endlicher, Iconographia generum plantarum. No. VIII. Tab. 73. 4to. Vienna. Sub. pr. 7s 6d.
- Fischer, Abbildungen zur Berichtigung und Ergänzung der Schmetterlingskunde. Part II. 5 plates. 4to. Vienna. 7s 6d.
- Flora Germanica exsiccata, sive Herbarium normal. Von L. Reichenbach. Cent. XVI. Folio. Leipz. Plates. 1l 10s.
- Fries, E., Epicrisis Systematis Mycologici seu Synopsis Hymenomycetum. 8vo. Upsal. 1l 2s 6d.
- Germar, E. F., Fauna insectorum Europæ cura. Part XXI. 8vo. Halle. 6s.
- Heine, F., Wildbad dans le royaume de Wurtemberg et ses eaux thermales. In 8vo. with 5 Plates. Stuttg. 15s.
- Hering, E., Ueber Kuhpocken an Kühen. 8vo. Stuttg. 4s 6d.
- Histoire naturelle des poissons, par le Baron Cuvier et Valenciennes. Vol. XIII. et planches. 8vo. Paris. 1l 4s.
- Hygea, Zeitschrift, besonders für spezifische Heilkunst. Redigirt von Dr. L. Griesse-lich. Vols. X. and XI. 8vo. Carlsr. Each vol. 12s 6d.
- Lecoq, H., Eléments de géologie et d'hydrographie. 8vo. Bruxelles. 12s.
- Leonhard, K., Naturgeschichte des Mineralreichs, etc. Part II.—Geologie et Geognosie. 8vo. Heidelb. 13s 6d.
- Lindblom, A. E., In geographicam plantarum intra Sveciam distributionem adnotata proponit. 8vo. Lund. 5s.
- Litrow, K. L., Populaere Geometrie als Hilfsbuch für Leser. 8vo. Stuttg. 3s 6d.
- Müller, J., Elemente der ebenen Trigonometrie für Schulen. 12mo. Darms. 2s 6d.
- Müller, J., Ueber den eigenthümlichen Bau des Gehörorgans bei den Cyclostomen, mit Bemerkungen über die ungleiche Ausbildung der Sinnesorgane bei den Myxinoïden. Imperial 4to. Berlin. 5s.
- Ohm, M., Lehrbuch der gesammten höhern Mathematik. In 2 Vols. 8vo. Leipz. 9s.
- Piorry, P. A., Diagnostik und Semiotik der neuesten mechanischen nosognostischen Hilfsmittel. Vol. III. 8vo. Cassel. 7s.
- Prinz, Dr. C. G., Praktische Abhandlung über die Wiedererzeugung der Schurtzpockenlymphe. 4to. Dresden. 4s 6d.
- Roemer, F. A., Die Versteinerungen des norddeutschen Oolithen Gebirges, Nachtrag von. 4to. Hanover. 7s 6d.
- Rösch, C., Ueber die Bedeutung des Bluts im gesunden und kranken Leben und das Ver-

- hältniss des Nervensystems. 8vo. Stuttg. 3s
- Schönlein's allgemeine und specielle Pathologie und Therapie. In 4 Parts. Vol. II. 8vo. (To subscribers.)
- Schlegel, H., Abbildungen neuer oder unvollständig bekannter Amphibien. 2d Dec. Folio. Coloured plates. Düsseld. 15s
- Schwann, T., Mikroskopische Untersuchungen über die Uebereinstimmung in der Struktur und dem Wachsthum der Thiere und Pflanzen. Berlin. 9s 6d
- Sturm, J., Deutschlands Flora in Abbildungen nach der Natur. Parts I. & II. 16mo. Nurnb. 7s 6d

NO. XLVII.

FOR OCTOBER, 1839.

- ART. I.—1. *Coranus textus Arabicus*. Edit Dr. G. Flügel. 4to.
2. *Coranus Arabice Recensionis Flügelianæ textum recognitum iterum exprimi curavit* G. M. Redslob, Phil. Dr. et in Univers. Lips. Prof. Publ. Extraord. gr. 8vo.
3. *Al Koran*.—By Mahomet. Translated by Sale, &c.

How is it the Koran is so little read? Our most popular tales are adopted from the East, our most popular poetry coloured from its imagery and its mannerisms;—Why is the most imaginative and most poetical of all Eastern compositions comparatively unnoticed? The deepest investigations of the historian relate to the stupendous revolutions which Asia has undergone. Why is the eloquence in which the most stupendous of these originated suffered to sleep in silence on the shelf? In an age when philosophy probes, and religion strives to reconcile, all the varieties of mental persuasion, why is the impregnable faith of half the world generally unread and almost always unstudied?

Such are the reflections and anticipations with which the literary tyro enters on the perusal of the Koran; but he has hardly concluded a chapter, before he finds the answer to his queries, and feels himself obliged to struggle with the very apathy he had condemned in others. A tissue of reiterated rhapsody—allusions which are unknown—regulations the necessity and the object of which are not understood—couched too in an idiom

and a phraseology very different from those of any other work with which he may be acquainted—are all the most attentive reader can at first discover. If he makes an attempt at translation, his patience has to undergo a still severer trial: the only tolerable version is that of Sale, who, though a master of the language, has been betrayed by a cruel scrupulousness into translating words rather than ideas. In both cases the result is commonly the same—the student throws by his book in disgust, and adds another to the number of those who are content to hear of the beauties of the Koran, without attempting to become acquainted with them. Or, if his resolution is proof against the difficulties he meets with, he runs through it without attention and closes it without an idea. Many chapters indeed, to all but the linguist, are better passed over than read, as they are mere repetitions of others more instructive—and none can be perused with interest till some clue is obtained to the order and object of composition.

We flatter ourselves, therefore, that we shall be doing an acceptable service to more than one class of readers, by taking a cursory review of the style, matter, and general peculiarities of this extraordinary work, and applying the leading chapters to the circumstances that explain their purport. This it is impossible to do without considering at the same time the character and fortunes of the author; and this article will consequently treat of Mahomet as well as of his Scripture.

At our first step we plunge at once into the awfulness of the general question. With the exception of prayers, a few of which only occur, the Korann is written throughout in the person of the Almighty. Remonstrances and instructions, promises and threats, blessings and curses, are all represented as proceeding directly from him. And though sometimes the current of enthusiasm and indignation seems to lose sight of its sacred source, the connection is constantly recalled at the end of the period. Though a good deal of what may be strictly termed poetry occurs in the early chapters, the bulk of the work is prose which rhymes. To preserve the concluding cadence, a few words of similar import and construction are constantly made use of, and it is this continual recurrence of almost identical phrases after sentences of prose, which renders translation such a difficult task. Without the license of poetry and without the plainness of prose, it is impossible to preserve its effect without sacrificing its identity. Were any one bound in translating Homer, or Hesiod, to render strictly all the complimentary and terminating epithets that have such a fine effect in the original, his version would be nearly as unentertaining as Sale's translation of the Korann. Yet in this there would be less difficulty, because in them every part of every line has all the freedom and fancy of poetry. It would seem, however, that the sentences have a rude species of rhythm independent of the terminating cadence; but one which is unattainable to a European ear. Our cathedral chants, in which verses of very different length are all adapted to the same melody, will enable us to understand how this may be.

If the reader* will turn to Mrs. Harris's petition in Swift, and his rhyming letter to Dr. Sheridan, he will find something that may give him an idea of the construction of the Arabic text, though none at all of its effect.

* To save him trouble we subjoin a few lines of each:—

- "To their Excellencies the Lords Justices of Ireland, the humble Petition of Frances Harris,
- "Who must starve and die a maid if it miscarries,
- "Humbly sheweth, that I went to warm myself in Lady Betty's chamber because it was cold,
- "And I had in my purse seven pounds four shillings and sixpence (besides farthings) in silver and gold," &c.
- "It is impossible to know by your letter whether the wine is to be bottled to-morrow or no.
- "If it be or be not, why did not you, in plain English, tell us so?
- "Truly I don't know who's bound to be sending for corks to stop your bottles with a vengeance.
- "Make a page of your own age, and send your man Alexander to buy corks, for Saunders has gone already above ten jaunts."

It is not the irregularity of carelessness, but of irrepressible emotion. Sometimes, in the earnestness of his enthusiasm and the exuberance of his fancy, the prophet hurries by his resting place, and expatiates with more than Pindaric license beyond it; sometimes two or three words, or even a single one of sounding utterance and tremendous signification, is made to respond to and balance a whole sentence. In either case the reader's mind sympathises with the expression more than the sound, and lost in the rush of feeling or stunned by the concentration of it, hardly perceives the inequality of the metre. After this description it can scarcely be expected that any versified specimen will be offered to the English reader. The attempt would be attended with inconceivable labour and very dubious success. Such occasional extracts, however, in prose, as will suffice to give an idea of the general style and feeling, we shall be obliged to present him with as the article proceeds.

The Korann it is generally known was produced and published in detached passages of from 2 to 100 lines, as occasion required. Whenever a new argument or a new taunt was to be answered, or a new rule established, it was said to be revealed by some new verses. These, according to Mahomet's directions, were either written separately as an independent chapter, or placed under some former one, to some or other passage of which he might consider them pertinent. In making these arrangements, however, he does not seem to have been guided by any very perfect knowledge of what was contained in former chapters, or by any very precise rules in commencing a new one. Hence two important peculiarities:—1. The chapters are of every imaginable length, from 2 and 3 lines to 1200 and 1500. 2. Every variety of subject, under every variety of date, is thrown together, without any visible connection, and the same sentences are repeated several times in the same chapter, and innumerable times in different ones, with some very trifling difference of expression. This it is which astonishes and disgusts the reader, who has not means, or who has not patience, to discover the occasion on which the separate passages were produced, and watch the workings of feeling and the changes of disposition, for which they are often so remarkable. This too it is which renders it impossible to make any thorough digest of the work, either in subject or date, without dislocating and readjusting with inconceivable labour almost every passage it contains. Another remarkable circumstance—the similarity, almost identity, of many chapters in style and matter, can only be explained by a reference

to the prophet's most singular distinction—i. e. his ignorance. No one that wrote what he composed, and read what he wrote, would have so often reiterated a single idea with such very slight difference of expression. But Mahomet, who could do neither, hardly ever recalled a previous composition without making some slight difference in the words; and this was sufficient, from the assumption of the Prophet and the zeal of his followers, to render it a fresh revelation, which it would have been impiety not to record. It is more than probable this tendency was encouraged rather than checked by the wily enthusiast. "Quin etiam voluminibus ipsis," says Pliny, "auctoritatem quandam et pulchritudinem adjicit magnitudo." And if this is the case with ordinary writings, it must be still more so with such as aspire to be called sacred. The speedily increasing bulk of the Korann no doubt excited the wonder of his enemies, and quickened the devotion of his friends. It is not impossible that some of these "alter idems" may have been produced by the casual omissions and variations incident to repetition. The original passages we know were written down from the Prophet's mouth, and then, after being promulgated among his followers, were deposited in a chest; but many must have been lost or misplaced, otherwise Abuhecre, in the year after Mahomet's death, would never, with all the original in his possession, have compiled the Korann as he did, by collecting all the copies of every passage that was extant, and recovering much that was missing, from the memories of the most ancient believers. Any alterations proceeding from this source, however, must have been very slight, as they must have been involuntary.

In arranging the chapters on this occasion, the Moslims, in their own thorough acquaintance with every part of the whole and every circumstance connected with its production, seem not to have considered it at all necessary to place the early ones before the late; chance appears to have directed the disposition. The latter chapters, containing the bulk of all the regulations relative to internal polity, were the first sought for, the first completed, and the first placed. Some, however, of an earlier date, being more readily obtained, intervened among the others; and the bulk of the chapters, which contained nothing particularly remarkable, naturally took their order according to what occasioned most solicitude to the compilers, viz. their length.

With the opening verses of the 73d and the 74th chapters, the Korann may be properly said to commence. We have there the Angel Gabriel's address to the Prophet,

exhorting him to prepare himself for his sacred office, and the words with which he imagined himself addressed by the same heavenly messenger, when he hid himself from the terror of his awful presence in the lap of his wife Khadijeh. That Mahomet was, at this period, frequently visited by mental perturbations of this sort, was the early belief of the Eastern Christians, whose vicinity to the scene of his life and labours entitles their testimony to some respect; and whose inventions, if taxed at all, would hardly have been satisfied with this innocent and ambiguous fabrication. By his followers, for obvious reasons, the assertion is not supported; but borne out as it is by internal evidence, an impartial inquirer will hail with joy this early clue to the morbid enthusiasm which, he will soon find, is the only motive, short of actual inspiration, that can explain the conduct of Mahomet and the triumph of his faith. No traces of this emotion, however, are to be found in any late chapter; and the question of his sincerity in ascribing the whole Korann to God, may therefore be agitated by some, independently of anything he might have believed with regard to these early passages. But here we must observe that the superstitious, the almost idolatrous reverence with which the work is regarded by Mahomedans, has only a very slender foundation in the text. Besides the general assertion that it proceeds from God, and the casual mention at the end of chapter 85 of the preserved table, in which it is inscribed, nothing can be found to justify the mysticism in which it has since been involved. If the reader will consult the end of chapter 42, and the beginning of chapter 53, he will see not only that this inconsistency may be easily reconciled, but that Mahomet makes concessions which leave no inconsistency at all. The Moslem commentators reading these passages by the light of their darling prejudices, pervert them into a more limited sense than they strictly bear: from their interpretations, Maraccius was too illiberal, and Sale too scrupulous to depart; and it is therefore necessary to render them afresh.

"By the star when it falls! Your countryman is not mistaken, neither speaks he by his own impulse: what is it but inspiration he is favoured with? The Almighty has taught it him: he has suggested to his servant what he hath suggested; his imagination has not deceived him in what he saw: wherefore then do you doubt him in what he sees? He hath verily beheld another descent—near the cedar of partition hard by is the abode of paradise. Where the cedar shades that which it shades—his eye shrunk not nor wandered—he hath verily seen

mighty things of the signs of his Lord."—Chap. liii.

"It is not possible for man that the Lord should speak to him except by inspiration, or from behind a veil; or he would send a messenger to suggest to him by his permission that which he pleases. Thus it is that we have suggested to thee in spirit (or by spirit) of what we ordain. Thou knewest not what was scripture nor what religion; but we rendered it a light to thee, that we might direct by it whom we please of our servants, for verily thou directest in the righteous path."—Chap. xlii.

From these words two things are evident; first, that Mahomet nowise asserts a supernatural appearance to attend every revelation: on the contrary, he thinks it sufficient to appeal to a single and a long past one; probably one of the identical illusions from which we have just seen him suffering, in order to give authority to all he said. Secondly, that he acknowledges that inspiration is carried on, not by visible means, but by an internal and invisible process. This is still more clear from a rather ludicrous passage in the 75th chapter, where he is desired not to be too hasty in pronouncing the words of the Korann, before the internal suggestion of it was completed. Still, if he was convinced that the mental process of composition was one of revelation, he was not insincere in asserting the Korann to be revealed; and if, in the zeal of instilling what he firmly believed himself, he represented (though we have no proof that he did represent) the presence by which he imagined himself guided, as more sensibly manifest than he felt it to be, he only practised one of those conscientious exaggerations to which none are so prone as the most virulent among his opponents.

The prophet was forty years old when he felt himself thus awfully called to the arduous task of changing the long established religion of millions. The affection of his wife Khadijeh—the childish enthusiasm of his cousin Aly—and the ignorant devotion of his servant Zeid—may perhaps be considered as natural and easy conquests. But the conversion of his friend Abubecre, a man of mature age, and high character, can only be explained by the instability and real emptiness of the religion he deserted. By his influence ten of the most respectable inhabitants of Mecca were prevailed on to listen to the prophet; and an attention that was probably at first only prompted by curiosity and politeness at last became sealed by conviction. To these fourteen the sacred secret was for three years confined, and it is to the lofty devotion of their earlier meetings that we must ascribe the beautiful prayer

which forms the first Chapter of the Korann:—

"Glory to God the Lord of worlds—the merciful—the compassionate—the Judge of the last day.

"Thee do we serve and thee do we entreat—Guide us in the right way.

"The way of those thou hast been gracious to—not of those thou art incensed against, nor of those who go astray."

No other composition belonging to this period seems to be extant, nor therefore to have existed:—*facit indignatio versus*. In pious calmness or the mere agitation of suspense, there was nothing to call forth the prophet's powers; to borrow his own expressive simile, it is during the storm that the thunder rolls and the lightning flashes. The Korann required the conflict of passion to give it birth.

In the fourth year he publicly asserted his divine mission; but here the power of prejudice was reinforced by the pride of family, the interest of office, and the insolence of age. He addressed the sacred guardians of a sacred city, and he was received with astonishment and contempt. We should expect to find in the Korann some amicable and mild invitation with which the men of Mecca were now accosted; but Mahomet's communications with them, as long as they would listen with decency, appear to have been verbal. In one of these conferences he was importunately applied to by a blind beggar, for instruction in the way of God: vexed at the untimely interruption, the prophet frowned and turned away in anger: for this he is severely reprehended in the 80th chapter, and this humble follower was ever afterwards distinguished with the most respectful treatment. With the exception of this passage and the few lines which compose the 105th and 106th chapters, no words are to be found applicable to the period in which he may be supposed to have regarded his adversaries with the hope of an enthusiast and the pity of a relative. This interval, however, was but short; he must have been prepared for incredulity, but he could not brook contempt. Mortified with the ill success he met, and stung with the contumely he received, he seems to have suffered dark moments of diffidence and doubt, when the warmth of his soul was chilled and its light extinguished, and when all the sacred hopes which had lifted him above his kind appeared to leave him below it. One of these mental struggles is beautifully depicted in the 93d chapter; the 94th is also on the same subject; indeed consolatory passages are of frequent occurrence all through the Meccan

chapters. The 93d being written in more regular metre than is generally to be met with, we have been tempted to present the following feeble version of it:

"No! by the morning's splendour—No! by the frown of night—
Thy omnipotent defender will not desert the right.
Tho' present sorrows rend thee, the future brings their balm;
High destinies attend thee, be thankful and be calm.
By him hast thou been cherished, an orphan in thy youth,
An infidel thou'dst perished had he not taught thee truth.
His bounteous hand has freed thee from poverty and scorn,
Then do thou relieve the needy, do thou the thoughtless warn."

These expressions, however, were but momentary—Mahomet had staked too much on his pretensions to suffer his own conviction to be shaken. In chapters 68, 111, 101, 102, 104, 108, and the continuation of 74, we find him maintaining his sacred character to its utmost height—sometimes consoling his animosity with mysterious hints of future and inevitable retribution, and sometimes relieving his passion in the terrific outpourings of a prophet's curse. In chapter 74 his anger adopts a strain of personal ridicule, which the striking singularity of manner can hardly redeem from the character of satire.

"Yes—he considered and he plotted—curse him how he plotted. Aye, curse him how he plotted—then he looked, then he frowned, and looked grave—then he turned away in his pride and said, what is this but a charm that is repeated, what is this but the speech of a man?"

The classical reader will readily recall the comic scenes which occur in the Greek tragedies, and wonder to find how natural in the simplicity of early composition is the union of the grotesque with the impassioned.

It is important to observe what at this early period was the devotional discipline which Mahomet imposed on his followers himself, and some may be surprised to learn that it was marked with the blindest zeal of fanaticism. From chapter 73 we find that the prophet and his scanty train of believers were in the habit of devoting half the night to prayer and religious meditation; and a permission is there given to relax somewhat of this unnatural austerity, from which it appears their health and spirits had begun to suffer.

On the strength of the only conjectures

applicable to the case, we should venture to place the chapters from 51 to 56, from 82 to 92, together with the 77th, 99th, and 100th, next in the order of composition. They are of all the most vivid in conception, and the most finished in style; and Mahomet in other chapters rejects with indignation the name of poet, to which none but these would seem to entitle him. Devoid of any attempts to reason with his adversaries, they seem adapted only to the early period of his self-taught ministry. Their constant theme is the truth of the Korann—the powers, the mercy of God—the terrors of the last day—and the fate of the obedient and disobedient after it. These topics indeed prevail in every chapter of the whole, but they were afterwards mingled with others, which we shall soon have occasion to notice.

The truth of the Korann is generally affirmed on the strength of the Almighty's oath. "By all that produces—by all that bears—by all that moves—and by all that distributes, what is promised to thee is verily true—this faith comes from heaven," (chap. 51.) In the profuse fertility of his imagination the writer sometimes crowds poetic images of the highest order into these preliminary asseverations. The classical or the sacred reader will perhaps be glad to compare the horses of Mahomet with those of Homer or of Job. "By the horses running wild and snorting—kindling the earth with the sparks they elicit—vying with each other in the freshness of morning—obscuring its splendour with the dust they raise—and rushing into the midst of it themselves." (chap. 100.) His descriptions of the last day are seldom below the Scriptures from which they are borrowed.

Cap. 99.—"When the earth shall tremble violently and shake off her burdens, men shall say what has come to it? Then shall she declare her tidings, for that the Lord hath communicated them to her."

Cap. 81.—"When the sun shall waver, the stars be obscured, and the mountains be moved—when the camel shall forget her young, and the beasts shall run together—when the sea shall boil—when souls shall be united—when the heavens shall be taken away—Hell be kindled and Paradise brought near."

Cap. 14.—"On that day the eyes of men shall gaze fearfully, dejected, cowering; not an eye shall wink; their hearts shall be a blank."

The Paradise of Mahomet is familiar to every one's imagination, but the inquisitive reader will find the most comprehensive representation of it in chapters 32 and 37. The passages relating to the inferno are those which do the least credit to the feelings if not the abilities of Mahomet. The utter

helplessness of man amidst the wreck of worlds, the consternation of the soul when standing in the sensible presence of an infinite Creator, are topics on which no man should presume to insult another. With a minuteness that is offensive and an avidity that is shocking, he dwells on every refinement of torture that human fancy can depict. The absorbing terror, the excruciating misery, the vain repentance, the prayers, the struggles, the shrieks of the damned, it seems to have been his delight rather than his horror, to contemplate. With a repulsive inconsistency he even makes it one of the occupations if not amusements of the blessed, to scrutinize the scene of torment and observe their former acquaintance in the midst of it. That his ostensible object in framing these fictions was to rescue his countrymen from the reality will not relieve him in the opinion of the metaphysician, from the reproach of those darker touches, which fancy, unassisted by passion, could never have produced. His real defence must be sought in the exasperations to which he was hourly exposed, and the natural vindictiveness which belonged to him as an Arab. It will be seen when the time comes for observing it, that malignity was not among his failings; or—a far greater praise—that if it had been, it was not indulged.

From these artless effusions of fancy and of feeling we pass to others more calculated to persuade. Chapters 7, 15, 14, 10, 20, 21, 19 and 27, may be taken as fair and sufficient specimens of the bulk of the Korann. From their vicinity to the Jews and the strict connection which had formerly subsisted between the two people, the Arabs had derived much traditional knowledge, and much fanciful superstition. The stories of the ancient patriarchs were familiar to their imaginations; and they perceived or thought they perceived in various catastrophes that had formerly befallen the most flourishing of their own tribes, similar instances of divine guidance and divine punishment. From the obstinate incredulity with which all recorded messages of God to man had been received, Mahomet must have drawn his earliest support under the staggering opposition which he met with, and he naturally used the consideration to produce in others the same conviction it had afforded to him. With fond pertinacity he every where recounts the missions of every prophet from Noah to Jesus, and the punishment of those by whom they were rejected. Identifying his own situation with that of the sacred warners, he sought to drive his despisers into identifying theirs with that of the vainly-warned. His imagination here got the better of his pru-

dence, and the modern inquirer makes it a serious objection to the truth of his mission, that he incessantly threatened what was never sufficiently accomplished.

This, though his principal argument, is not his only one. The Coreysh had asked, how the orphan son of Abdallah, whom for forty years they had known only to disregard, should suddenly become the bearer of heaven's commands to them? With equal skill and effect he wrests his antagonists' weapon from their hands and uses it against themselves. "If," replies he, "I have lived so long an unpretending citizen, wherefore should I pretend now? and if I have been hitherto undistinguished, where have I at once acquired the energies I now display?" The Korann, by a parity of reason, is assimilated to the books of former prophets, which the Arabs enumerate to an extravagant amount; but his favourite and most frequent argument is its inimitability. In the height of his confidence he extends the challenge to the invisible powers of genii and demons; and the weary student wonders to find the whole truth of the mission staked, and staked successfully, on the impossibility of equaling a single passage. How far this vaunt is borne out by the actual merits of the work it is difficult to say, as no native critic can be an unprejudiced one. The fact that nothing equal was produced seems staggering; and yet we learn from the book itself that its decriers always asserted it to be nowise beyond the standard of human invention; it is easily conceivable that pride or listlessness may have restrained them from the contest, even if no diffidence in their own powers would else have induced them to decline it. Among other of their objections we find from chap. 25, that they accused Mahomet of being assisted in its composition by some one, who, we learn from the answer, was a foreigner. Maraccius, Prideaux, and other polemical decriers have seized hold of this circumstance to deprive him of the honour of originality, forgetting that no foreigner could supply more than the matter, and that the merit of the Korann lies in its style and spirit. Had their attention been as great as their virulence, they might have drawn from the Korann itself more satisfactory evidence on this point than can possibly be afforded by the casual allegation of his adversaries. It is thronged with imitations of Scripture from Genesis to the Revelations; and Mahomet being totally illiterate himself, must have learned these original passages from others. He was in the habit, it appears, of listening to two Christian youths, shopkeepers of Mecca, who used to read the Bible aloud, while sitting in the streets. This

probably contributed from the first to inflame his imagination, and raise in him the frantic piety which lifted him above himself.

Many sacred legends will be found from which no particular inference seems to be drawn or intended, and it appears, therefore, to have been one of the author's objects to draw together every tradition that was likely to impose on his hearers, and by making the work a receptacle of all that was holy, to raise a presumption that it was holy itself. From the 18th chapter, which is entirely of this nature, we extract one of the very few passages which is likely to interest the cursory reader :

"Then they found one of our servants to whom we had been gracious, and given him instruction from ourselves. Moses said, may I follow thee, that thou mayest instruct me in some of what thou art directed in? He said, thou wilt not be able to bear with me; how should you bear with what you do not comprehend? He replied, thou shalt find me patient, I will not be disobedient in aught. He said, then if thou followest me, ask not of any thing until I mention it to thee. So they went on, till they entered a boat which he split. Have you split it, cried Moses, that you may drown the owners of it? You have done a strange thing. Did I not tell thee, said he, that thou couldst not bear with me? Chide me not, said Moses, in that I forget; and be not harsh at my behaviour. Then they went on till they met a child, which he killed. What, exclaimed Moses, have you killed an innocent person without his having killed another! truly you have done a grievous deed. Did I not tell you, he said, you could not bear with me? Moses replied, if I ask you about any thing after this, take me with you no longer, verily my excuses are sincere. So they went on till they came to a village, where they asked its inmates for refreshment, but they refused to entertain them, and they found in it a wall that was about to tumble, and he set it straight. If you pleased, said Moses, you might here requite them. This, said the holy man, is a separation between thee and me; but I will explain to thee that which thou couldst not bear with. The boat belonged to some poor people who labour on the sea, and I wished to injure it, because a tyrant was in search of them who takes every vessel by force. As to the child, his parents were righteous, and I feared he would afflict them with his unruliness and impiety, and I wished the Lord might give them in exchange a better than he, innocent and dutiful. The wall was the property of two children, orphans in the city, and beneath it was a hidden treasure belonging to them; and their father was righteous, therefore the Lord wished that they should arrive at maturity and obtain their treasure, a tender mercy from the Lord. I did it not of my own suggestion. This is the explanation of what you could not bear with."

But the line of argument adopted by Mahomet involved him in difficulties which more than outbalanced the advantages he derived from it. The miracles performed by the sacred characters to whom he strove to assimilate himself, formed the most striking part of their histories, and he was naturally urged by those whom he addressed to bring the same proof of his divine commission. His continual and contradictory excuses on this point form a leading topic of the work, and prove how much vexation it occasioned him. He often contents himself with expatiating on the inscrutable ways of God till he loses sight of the question. Sometimes he assures them that they would be unable to endure the terrors they demanded. Sometimes that they were too obstinate to be affected by them. His adversaries saw their advantage, and daily in the streets of Mecca the preacher was surrounded and interrupted by scoffers, who defied him to overwhelm them with the vengeance he predicted. "I am a preacher, not an angel," was the disconsolate reply. "Vengeance will come with the hour appointed by God—that hour none can accelerate, any more than they can avert it when it arrives." Here, however, was another difficulty. In his unbounded jealousy for the glory of God, Mahomet asserted the doctrine of predestination in its utmost strictness, and even while reproaching his hearers for their incredulity, he inconsistently assured them that belief and disbelief were the immediate effects of divine agency. In one of the chapters above noticed, he will be found vainly endeavouring to solve the problem by which the vastest intellects of every other age and country have been baffled and bewildered.

If the reader supposes these arguments to have been advanced, or these disputes carried on, in any connected form, or with any logical precision, he has a very imperfect notion of the Korann, where every proposition is involved and entangled in the fury of denunciation, or the rhapsody of piety and praise :

"God's treasures are the secret stores, none knows of them but He;
To Him each atom stands revealed, in earth,
or in the sea;
'Tis He that steals thy soul at night, and
watches thee by day,
And guides thee still to do His will, resist it
how you may."

Such are the incoherent, and often impressive ravings which form the groundwork of the whole text. But the more mystic fancies prevalent among his countrymen were too congenial to the enthusiasm and character of Mahomet, and too conducive

to the aid he sought, not to find a place. The secret inspection of angelic ministers—the invisible crowds of genii, that thronged alike the wilderness and the city—the imperceptible energies and inscrutable essences of the animal and material worlds—are topics he delights to dwell on. In the wilderness of his fanatic fancy he sought till he imagined he had found, among these mysterious beings, the kindly reception he in vain solicited from his fellow men. The genii, he affirmed, had heard and believed; and his idle hearers recoiled around him as they were told of the airy beings even then thronging to listen to his words. In chapters 46, 50, and 72, the reader will find enough to gratify his curiosity on this subject.

The precepts and regulations of Mahomet will generally be of a later date than his mere exhortations, since they imply that he gained attentive and zealous hearers. They will be found in chapters 6, 20, 45, 31, 17, 26, 30, 70, and 42. The two first, being of a general and prohibitory nature, may perhaps have been among the earliest composed, but, for the sake of classification, we have preferred noticing them with the rest. By no European writer has the demoralization of the Arabs at that period been adequately described. In addition to the lawless and ferocious habits which seem inseparable from the peculiarities of the country they inhabit, they lived in the grossest superstitions, and in the habitual violation of the plainest rules of domestic morality. Guided in every important contingency of life by superstitious fancies, they seem only to have exercised free-will when roused by anger or solicited by cupidity. This extreme of mental debasement produced, as is usual, the opposite excess in the more enlightened few; and we find Mahomet, induced by the scepticism of some among his adversaries, to argue repeatedly on the abstract possibility of resurrection after death. His moral instructions were well suited, by their simplicity, to reform the perverted feelings of his countrymen, and many rude converts to the beauty of truth ignorantly ascribed to him the excellences that in reality belonged to his doctrine. Besides the prohibition of interest, (a law adopted on misapprehension from the Jewish code) his rules merely embody those broad principles of rectitude which the unperverted reason of man must universally acknowledge. They form, it must be observed, a very small part even of the few chapters in which they occur—not being in their nature adapted to the amplification in which he was, on other topics, so fond of indulging in. The internal rules he prescribed to his followers were likewise of

necessity few and simple, since their number was not yet sufficient to require more, and his attention was engrossed in the endeavour to increase it.

We have already remarked the excessive austerity of devotion which he at first enjoined, and in chapter 20 we find him again exhorted not to distress himself in his religious service. As his experience increased, and his enthusiasm was diverted into another channel by the opposition he had to encounter, he adopted a course better suited to the infirmities of mankind. Three hours were appointed for prayer; the two twilights and the first watch of the night:—the noon and afternoon prayers, which complete the five, were not added till after the Higerá.

The only particular of ritual devotion he as yet insisted on, was the annual pilgrimage to the Caaba. The ceremonials prescribed on this occasion are detailed in chapters 22 and 2. Mahomet's motives in confirming this singular practice have often been misunderstood. Savary supposes him to have been guided by political considerations; and, in point of fact, the periodical assemblage of the discordant tribes of Arabia, at this common object of their veneration, would do much towards softening their mutual animosities, and strengthening the resources of the country by combination. Sale imagines that he himself was averse to the practice, on account of the superstitions that had mingled with it, but that he was compelled to sacrifice his own inclinations to the overpowering prejudices of his countrymen. In this supposition he is countenanced by the fact, that the first chapter in which it is actually prescribed was revealed only a short time previous to the Higerá. But Mahomet seems, on every other occasion, to have been so entirely guided by religious feeling, and to have so sternly resisted the slightest compromise with any thing his conscience condemned, that we are compelled to seek some more satisfactory solution of the question.

Let us hear him speak for himself.—“To every sect have we appointed a place of sacrifice—where they might call upon the name of God over what he has bestowed on them of animals and cattle.” Here he evidently alludes to the temple at Jerusalem, and the three great feasts, at which all the males among the Jews were bound to appear there before the Lord. And this is not the only particular in which he seems to have borrowed from the Mosaic ritual, for no other reason than because it was a divine one. The tradition, too, which referred the building of the Caaba to Abraham, and which is fully recognised by the prophet in chapters

14 and 2, gave it a specific sanctity in his own eyes, which probably prevented him from inquiring into the causes or effects of its being similarly regarded by others.

The injunctions most frequently repeated throughout these chapters relate to a point of considerable importance—the intercourse of his followers with the unbelievers. Men of rude intellects are more influenced by feelings than by reason; and the prophet therefore prohibited them from forming or indulging in friendship with the unconverted. Ridicule, the sharpest weapon to which feeling can be opposed, was all in the hands of their adversaries; and consequently his disciples were forbidden to engage in disputes.

It must not be forgotten that many expressions and ideas are borrowed, and many passages copied from the Jewish and Christian Scriptures; and the Korann, formed upon both, may be considered as occupying a middle place between the two. Mahomet himself at first practised as well as recommended much of the meekness and humility of the Gospel. “Be gentle towards those believers that follow thee; and if they are unruly, say, Verily I am blameless in what you do.” (chap. 26.) During a period of ten years that he was exposed to daily insult and daily peril, he never once offered to repel by violence the violence that he endured. But the hatred and ferocity of his enemies drove him to the policy which changed the history of the world. The fierceness of Hamza and the zeal of Ali scorned to acquiesce in a doctrine of submission; and on one or two occasions, when their sacred relative had been treated with more than wanted indignity, they took the liberty of signally avenging him. The feelings of the man were too strong for those of the prophet. Mahomet allowed the act to pass uncensured. The noble pair became his defenders on every emergency, and the comfort of such a safeguard grew the more indispensable the more it was enjoyed. By chapter 23 the divine sanction was given, for the first time, to a hostile principle: “Repel evil by whatever means are best.” How widely such a precept may be interpreted it is needless to observe. The rule of endurance being once departed from, the mutual animosity of the parties necessarily led to the opposite excess. The hardships to which the early converts were exposed in Mecca had induced them, by Mahomet’s advice, to seek security elsewhere; dispersing throughout the surrounding country, they carried with them, wherever they went, the story of their prophet’s sanctity, and (in their eyes) the proof of his inspiration. The contagion of enthusiasm and the beauties of the Korann

excited expectation even where they failed of credence—which, however, they often obtained. A king of Ethiopia dispatched a present to the prophet, and declared himself a believer. An ambassador, who arrived on a public mission, had the curiosity to visit the man of whom he had heard so much; and, after a short conversation, espoused his faith, which he promulgated among his countrymen on his return. The different feelings entertained towards him within and without of Mecca, must have forcibly struck the prophet, and matured the latent resentment which ten years of patience had nursed. The country seemed ripe for change. The high destinies he had promised himself were at hand, and he might now flatter himself, without extravagance, with the hope of fulfilling his sacred mission. But Mecca stood as a blot on the fair picture. What wonder if he panted to wash it away? Fiercer thoughts mingled with his holy dreams—the interests of his religion, he might say, were changed—the policy of it must be changed likewise. Other circumstances contributed to confirm him in this train of thought. Abutalib, though an infidel, his most powerful friend and protector, had died, and the violence of his enemies was proportionably augmented. His wife, Khadijeh, whose confidence had supported him in his misgivings, and whose affection had soothed him in his humiliations, was now no more—and nightly the prophet returned from a hating city to a lonely home. The exasperated state of his feelings may be traced in chapter 36, of all others the most pregnant with resentment against his adversaries, and the most calculated to excite a similar feeling among his followers. Chapter 23 had pointed to the sword, but chapter 42 took it up—revenge of injuries is there reckoned among the virtues of a believer.

Could the Coreysh have moderated their animosity, Mahomet, thwarted and incensed as he was, might still have been reluctant to leave the holy city of his affections and his faith—he might have lived, tolerated by some and revered by others, till the spirit of his party—perhaps his own—burnt feebly and faintly to a close. Unfortunately he was forced into immediate contact with his partizans. The Coreysh, tired of the disorders they experienced in their own city, and alarmed at the hostile feeling of the surrounding country, resolved to take his life. The time, place, and manner of executing their purpose was agreed on. Mahomet obtained intelligence of it—published the verses of the 22d chapter, inculcating resistance against persecution, and flight, for the free exercise of religion, and escaped with difficulty to Medina.

This city, the most populous of Hijaz, was situated in the heart of the country where Mahomet's name had been celebrated and his faith diffused by his disciples; and in this he was received with universal enthusiasm as a prophet and a prince. His confidence was restored and his conviction strengthened by the multitude of those who believed; and what before might have been the doubtful whispering of desponding fanaticism, now assumed the decisive tone of certainty, when echoed by the ready credence of thousands. Thus it was that the incredulity of his enemies appeared the more unreasonable and the more criminal, at the very moment when they had raised his resentment to its utmost height. The result was the 47th chapter of the Korann, in which war to extermination is openly declared against all the enemies of his faith. The consternation of his followers cannot be better represented than in the words of the chapter itself: "They stared on thee with the stare of a dying man." From this time the Korann is a code of law, and a law of blood. Chapters 61, 2, 65, 8, 57, 60, 62, 63, 64, 102, 3, 58, 59, 4, 16 and 5, are successive and pretty clear records of the policy pursued by Mahomet during the first five years, and the success with which it was attended. It will evidently be impossible to comprise within the limits of this article, even the most cursory review of his civil regulations, and our attention will necessarily be confined to the leading circumstances and prominent feelings of the period in which they were produced. It would be expected from the energy of the prophet's character, that when he had once recognised war as a principle of religion, he would take the most decided means for prosecuting it with effect; and accordingly, far the greater part of the Median chapters are devoted to this purpose. All the unlimited resources of divine approbation and displeasure are exhausted in animating his followers—but the ardour which carried them to the field could not support them while they were there. A thousand expenses were to be defrayed;—unable to meet them himself, Mahomet resorted to religious contributions and loans without interest. From one or other of these species of co-operation no one was excused, but those who were too poor to give and too weak to fight. The men who, satisfied with the truth of his religion, would have sat down quietly to enjoy the profession of it, and left its farther propagation to the Almighty Being whose care it might be supposed to be, are stigmatized as hypocrites and reviled as cowards. In these precepts, the results entirely of

Mahomet's necessities, we trace the origin of the feelings and defects which have always prevailed in Mahommedan society. From the violent and continual excitements to war, they derived their restless and indomitable ferocity. From the assurance of divine guidance and favour, arose their personal pride and intolerance and their abject submission to their rulers.

If the Arabs had heard with dismay their prophet's declaration of war against the world, it was owing to its extent rather than its nature. With that singular and unchanging people rapine has always been a legitimate means of subsistence, and war and rapine synonymous terms: it is not then surprising that they gladly embraced a principle so congenial to their characters and interests. Indeed, from Mahomet's inveighing so repeatedly as he does, against the lukewarm, the worldly-minded, the hypocritical, and the refractory, it would seem that the majority of his newly-acquired followers were more influenced by that part of his religion than by any other. This was particularly the case with the rougher tribes of the desert, who are more than once designated as peculiarly stupid and unfeeling. In the simplicity of their hearts some of them had ventured to require the repayment of the loans they had made. It is amusing enough to observe the indignation with which the prophet alludes to the circumstance.

After a series of skirmishes they had the good fortune to surprise a rich caravan and defeat a superior force which marched to its relief—but the contest had been severe, and in the ardour of their gratitude they attributed to the succour of angels what was really the effect of their own bravery and desperation. An anecdote follows, without parallel in the annals of self-deception. The prisoners were the former persecutors of the prophet, and it might have been expected that he would not omit to practise the virtue he had inculcated—revenge—but he dismissed them on ransoming themselves; and soon after being found in tears, he produced the following passages (chap. 8), and informed his friends that they had narrowly escaped being destroyed by God, together with himself, for this unseasonable clemency:—

"The prophet may not keep prisoners till he shall have destroyed (unbelievers) throughout the earth."

Captives, however, were allowed the option of becoming Moslims before execution. And again—

"Say to those who reject thee, if they will repent, what is past shall be forgiven them; but if they return to their transgressions the example of former ages is before thee.—Slay them till there is no resistance; and all religion is to God."

That this was the system best adapted to secure the triumph of his faith there can be no doubt, and the story plainly shows how strictly Mahomet considered his duty to be confined to what was so. This is the first passage that intimates any anticipation of the future extent of his spiritual empire—but it seems rather to have originated in the exultation of recent victory, than in any sober and unalterable conviction. In the next year the Moslems were totally defeated at Ohad.—Mahomet himself was severely wounded, and narrowly escaped with life. Among the many contradictory excuses by which he strove, in chapter 3, to reconcile this untoward event with his promises and his pretensions, the reader will observe with satisfaction that he never once alludes to any certain and definite hopes of the future. He seems to have accounted for it in his own mind by supposing it to be a trial of his followers' sincerity; but in his eagerness to relieve their apprehensions he rings the changes on every imaginable topic applicable to the occasion, with a hurried inconsistency that sufficiently marks his anxiety and embarrassment.

This was the only check (if we except the doubtful war of the Ditch, spoken of in chapter 33) which Mahomet met with, and this his energy and abilities soon retrieved. Not a year passed without the reduction or submission of some hostile tribe. Though commanded to kill and slay, and spare not, he seems to have considered himself authorized to treat on less sanguinary terms, and some of his enemies were allowed to remove unmolested from his dangerous vicinity. Treachery and breach of faith, however, he never pardoned, and the entire massacre of a Jewish tribe that had revolted, is a terrible instance of the severity he thought himself bound to exercise on such occasions.

Many passages, relating both to Jews and Christians, are to be found in all the Medinian chapters; and his conduct towards both people is sufficient to show that hostility in general was no farther his object than as he was prompted to it by his religious persuasions. Appealing as he did to their Scriptures, as the foundation and the proof of his own prophetic office, the idolaters of Mecca had considered him from the beginning as a Jewish or Christian sectarian. Far from wishing to disown the connection, he made every attempt to strengthen it by

conversion from those sects. But the hopes he entertained on this subject never prevented him from inveighing against what he termed their departure from the original purity of their respective faiths. The Christian tenets in particular were the subject of his repeated and most violent vituperations, from the grossness which the insufficiency of language renders unavoidable in expressing them.

"They have said, the Everlasting hath taken to himself a Son.—Verily you approach a tremendous subject. It wanted but little that the heavens had cracked, the earth split, and the mountains crumbled to the dust—for that they named a Son to the Everlasting.—It suiteth not the Everlasting to take to himself a Son; for all that is in earth and heaven, doth it not crouch to him?"—Chap. 19.

Their morality, however, he warmly admired; and it cannot escape an impartial observer, that up to the period when he was driven by his enemies to adopt the severity of the Pentateuch, his own precepts are entirely formed on the mild spirit of the Gospel; while the personal character and sacred office of Christ are invested in the third and other chapters with every attribute which, short of divinity, it is possible to bestow. On his arrival at Medina the Jews, who formed a very strong party both in the city and its vicinity, met all his overtures with the most determined opposition. They seduced his followers, openly ridiculed his pretensions, treated him with personal disrespect, and took every opportunity to unite with his assailants. The angry observations and strict injunctions which this conduct produced, are too frequent not to be observed—but it is pleasing to remark, that in the 5th and 9th chapters, the latest that were produced, long after Mahomet must have given up all hopes of overcoming Christian faith and Jewish obstinacy, he recognizes their claim to brotherhood as a scriptural people—allows his followers to eat the same food, at the same table—and exempts them from the general rule of extermination by allowing tribute in place of conformity.

The same consciousness of divine inspection, and the same reference of every provision to the interests of religion, are observable throughout. "I have seen," says Mahomet, in the pious exultation of success, "I have seen men embrace the faith of God in crowds. Then celebrate the glory of thy God, and pray to Him for mercy; verily he is willing to listen."

Observe this prayer which concludes his first attempt at legislation.—Did human language ever breathe a deeper and more unaffected piety?

"To God belongs all, in heaven and earth; and whether you show what is in your thoughts or conceal it, he will lay it alike to your account; for his power is unlimited.

"The prophet has believed in what was revealed to him, and all the faithful believe in God—in the angels, the scriptures, and the prophets, among whom is no variance; and say, we have heard and obeyed; merciful art Thou, O Lord; unto Thee shall we be taken.

"God will not require of any but according to his power; to each shall be what he gained, and on each what he incurred. Thou, Lord, wilt not scan too nicely our neglects or our offences. Thou wilt not load us with a covenant as thou loadest those before us—Thou wilt not put upon us what we cannot bear.—Thou wilt spare us—Thou wilt forgive us.—Thou wilt pity us.—Thou art our God. Oh, defend us against the unbelieving."—Chap. 2.

In another chapter, where he is desiring his followers to avoid disputes with the Jews and Christians, he tells them, when pressed on points of faith, to submit the question to a divine ordeal. The disputants were to kneel down with their wives and children and invoke the curse of God upon the erring party—what a singular contrast between the strength of his conviction and the weakness of his cause!—The pretensions are unfit for belief that will not bear discussion—and yet the man who in an ignorant and superstitious age could solemnly submit a claim of inspiration to the immediate judgment of God, *MUST* have believed all that he averred.

We now arrive at those singular and important chapters, 49, 33, 24, and 66, from which it seems evident that whatever may have been Mahomet's own opinion of the impulses by which he was conducted, they had really no deeper or holier origin than his own bosom. While at Mecca, he had constantly disclaimed any other authority over his followers than that which the sacred duty of admonition might give him: but six years of absolute power and continued success had altered his tone. His followers are now told that they are not to speak to the Prophet so familiarly as they would to each other; that they are not to raise their voices in his presence, nor call to him when he wishes to be private; that they are not to enter his house unbidden, nor to discourse on ordinary topics while they are there; and lastly, that no one is to have a will of his own when the Prophet's pleasure has been declared. It will not escape the reader that all these tributes of respect are necessary consequences of Mahomet's general pretensions. It is his jealousy in insisting on them and producing the divine mandate for their observance, which betrays the exacting feelings of earth-

ly authority. The 33d chapter furnishes us with a still heavier charge. In a casual visit Mahomet was smitten with the charms of Zinaba, the wife of his freedman Zeid. The affectionate follower balanced not a moment between his own inclinations and those of his friend and master. Zinaba was divorced by Zeid, and married by Mahomet. But Zeid having been previously adopted by Mahomet, the marriage, by the existing laws of Arabia, was incestuous. This to a Prophet was a trifling objection; the laws that made it so were condemned and abrogated; and the hesitating Moslims were assured by the word of God that Mahomet was irreproachable. Yet even this was not enough. The legal number of wives to which the faithful were to confine themselves had been fixed at four; the Prophet, however, is exempted from this and every other restriction on his connubial caprices; while his harem is secured from the attempts or wishes of his followers by the divine declaration, that the Prophet's wives must be regarded as mothers by the rest. This revolting interposition of heaven in his domestic arrangements is carried a step farther; and the word of God is at last employed to reprehend two of his wives—for resenting, with the sacred pride of women, an act of infidelity in which they had detected him.

It would be well if the effect of Mahomet's weakness in all that concerned his favourite passion had been confined to the days in which he lived; but society still suffers from another instance of it. His favourite wife Ayesha had been separated from the camp, under circumstances which gave him much uneasiness; from this he was relieved by the 24th chapter, which assured him of her innocence, and ordained that no respectable female should suffer in character till four witnesses could be found to depose to the fact; and any one who called it in question on insufficient grounds was to be publicly scourged. A worse law was never promulgated. No woman who is criminal enough to bring herself under its scope, will be clumsy enough to allow these means of proof to be forthcoming. The offence is necessarily secret; and suspicion, instead of meriting the scourge, is a useful substitute for the legal punishment that must generally be escaped. Such as it was, however, it was most unjustly enforced in the very case that suggested it; and the stripes of Ayesha's accusers furnished a most edifying and convincing evidence of her innocence. Yet the Moslims confess that the most virulent was suffered to escape, because he was a person of consideration and influence; so incon-

ceivable are the inconsistencies which fanaticism can reconcile to itself.

If there were ever moments in which, according to the immortal historian of declining Rome, the victorious impostor smiled at his early credulity, they were certainly these, in which he unblushingly legislated for his own dignity and his own indulgence. The supposition, however, is one on which it will be difficult to account for Mahomet's behaviour in every other particular during the sequel of his life; and if we attentively consider his situation, we shall perhaps be able to form a more consistent conclusion. Nearly twenty years had elapsed since he experienced the illusions in which his convictions originated; and after that period, the form in which his regulations were issued must have become habitual. Success, which was to him the confirmation of all he imagined, had been immediately owing, he must have felt, to his own energy and conduct—to his own actions and his own feelings. What wonder if at length he considered a union so long undissolved as indissoluble, and forgot in the casuistry of self for self, the sober limits by which divine interposition must be confined?

The very next incident to which the Korann (ch. 48) alludes, shows that Mahomet was still governed by his imaginations. Having been all along engaged in war with the Meccans, it was impossible for the Moslems to perform the sacred pilgrimage to the Caaba, which Mahomet had made a fundamental part of his religion. In the sixth year, however, he informed them of a dream with which he had been favoured, according to the obvious interpretation of which, he assured them, that they would that year gain admittance to the temple, and perform all the sacred ceremonies prescribed on the occasion. On the faith of this, with unexampled simplicity, he set out at the appointed time, accompanied by the chiefs only of his followers, unprepared either to offer or resist attack, and trusting for the accomplishment of his prediction to some secret exertion on the hearts of his enemies of the same high influence by which he professed to have been assured. No such solution of the difficulty, either miraculous or accidental, was fated to befall him. As they approached Mecca, the Coreysh met him by a short and stern mandate prohibiting his further advance; and the disconcerted prophet suddenly found himself not only deceived and the deceiver of others, in respect of what he had so confidently announced, but thrown by his own credulity, with all the moral strength of his party, into the reach of their enemies;—a species of

hostage for his better behaviour if allowed to return unmolested. Nothing could have saved the party and the religion from extermination, but one of those conventional points of rude morality which are sometimes found to prevail among a barbarous people, with a force exactly proportioned to their essential insignificance,—as if by an unconscious instinct of society the blindest deference was to be exacted from the feeling, when least could be commanded from the judgment. Amidst the chaos of anarchy and outrage which the entire peninsula has always presented, four months had been set apart from the earliest periods for the annual season of universal truce. Singularly tenacious were the Arabs of this their last homage to the duties and dignities of civilized life; and the wild rovers of the desert, who knew no other law, amerced themselves for all their excesses, by the undeviating strictness with which they adhered to this. Mahomet then must not be considered to have taken this singular step without something like a shadow of safeguard to his party on definite and demonstrable grounds. Of all the months that were thus held sacred to repose, the most sacred was that in which the pilgrimage was taken; and throughout all the peninsula, in which outrage was then criminal, it was most criminal in the precincts of the city he now approached. But the temptation offered was immense:—the long score of suffering and indignity that might be wiped away—the fair prospect of peace and supremacy that might be secured at a blow, which the unguardedness that provoked would almost seem at the same time to justify—this must have been no light consideration among an impetuous people and to a falling party. That the situation and the opportunity was felt on both sides we know from what followed. A treaty was concluded, in which Mahomet granted peace to his bitterest enemies, on condition of his being allowed to make the pilgrimage in future—the Coreysh being bound to evacuate the city as soon as he approached it. In his eagerness to conclude the agreement, the Prophet waived, in the wording of it, the high pretensions he had so strictly maintained on all other occasions. Nay he was obliged to acquiesce in present disappointment as the only price at which he could obtain the remote and contingent accomplishment of his predictions. In resisting their present entry into Mecca the Coreysh were inflexible, and the Moslems were compelled to retreat with only the promise of the promise they had come to fulfil. The next year the treaty was observed on both sides, and the attachment of the Moslems to the city of their faith, was augmented by the joy

of performing their long-delayed rites. Strengthened by the submission of fresh tribes, they panted for an opportunity of securing it for ever to their feelings and their faith. To persons so disposed, the occasion could not long be wanting. The Coreysh had joined in hostility against a tribe in the alliance of the Moslims. Mahomet declared the treaty was infringed, and produced the 9th chapter of the Korann, containing the decisive declaration that after that year no idolator should approach the Caaba. The composition was instantly dispatched to the Coreysh, and Mahomet followed with an army of 10,000 men. The situation of the two parties was here precisely the reverse of what it had been on the previous occasion. The Meccans were taken by surprise, and having themselves in a manner infringed on the law of the sacred truce in their conduct to the tribe whose cause Mahomet espoused, they were justly held by him to have forfeited all claim to benefit by it on the present occasion. Unprepared for resistance, submission was their only resource; and Abu Sufian, the Prophet's most determined foe, waited on him with the keys of the city. What follows is the touchstone of Mahomet's character. His bitter insulters, his unrelenting enemies were in his power, and he pardoned them!—those who declined embracing his faith, being left at liberty to go where they pleased. The conquest of Mecca was speedily followed by the submission of the provinces of Yaman and Najd; and Mahomet found himself the political and religious head of his country. With this, the historical part of our article concludes. A few passages of the 48th, 9th, 8th, and 5th chapters there are which were composed in the following year; but the interest of the Korann terminates, together with the opposition it met with, and the difficulties under which it was produced.

A slight consideration will convince us that Mahommedanism is neither to be assailed nor defended by the arguments usually resorted to. Neither the perfect conviction of Mahomet and his contemporaries, nor the rapid and unlimited conquests of his successors, can be admitted as a proof of his real inspiration. Credence equally implicit, and in the beginning equally extended, has been given in various ages of the world to tenets, to all of which it is impossible to subscribe. Invasions, equally extensive and equally successful, have often been produced by the unpretending impulses of want and ferocity. On the other hand, no considerations drawn from the character of the pretender, or the actual nature of the faith he established, can be insisted on with-

out involving us in serious inconsistencies. In its professed object and primary tendencies, the religion he preached was infinitely superior to that he supplanted, and singularly suited to the characters of his countrymen. And if the wisdom of Providence has on other occasions adapted its dispensations to peculiarities of civilisation, and given one nation laws that were not fitted for another, and precepts in which they could not live, we cannot now reject another system because it contains some and fewer imperfections of a similar kind. Inspiration seems always to have acted within the limits of character and country; and those who admit David to have lived under the guidance and in the favour of God, cannot altogether object to similar claims in another.

On this, as on many other important questions, we must be content for the present to come to a conclusion less certain than we should wish to arrive at; and in the equipoise of more decisive arguments, the reader's judgment will perhaps be satisfied with the following considerations: Mahomet's system was not uniform: it began in peace and humility, and ended in arrogance and havoc. Contradictions so serious as these bespeak the inconsistent emotions of human feeling, rather than the steady guidance of unalterable wisdom; and whatever allowance we may be inclined to make for those necessary tendencies of disposition which cannot be banished without destroying personal identity, we cannot suppose that absolute guilt, or even particular indulgence, should be sanctioned and defended by the word of God. But by the distinct admission of Mahomet and all his followers, the question mainly rests on the inspiration of his scripture, and the whole pile of Moslim faith and Moslim arrogance falls with the authority of the Korann.

But it is impossible to degrade Mahomet as a prophet without exalting him as a man. If superiority to the prejudices of age and country—if perseverance in a sacred cause, despite of persecution and of ignominy—if clemency in the full career of contest—if unequalled influence over the minds and passions of mankind—give a title to the admiration of posterity, where shall we find, short of Mosaic inspiration, a claim so undeniable as his? The inconsistencies of his conduct a philosopher will readily excuse, as they were the natural results of a system he was compelled to adopt: and a Christian will grieve to consider, that if his original intentions could have been carried into effect, the simple purity of the doctrine he taught would have left little for the propagators of the gospel to overcome.

ART. II.—*Geschichte der Magyaren* (History of the Magyars), von Johann, Grafen Mailáth. 5 vols. 8vo. Wien. 1828—1831:

TIME has been when Hungary constituted a politically important part of Europe; when upon that remote, and now unregarded eastern province, the eyes of the continent were bent, first in terror, afterwards in anxious, trembling hope. At an early period of modern history, when the Carlovingian dynasty was sinking towards final extinction, from Hungary issued the swarms of Magyars who for upwards of half a century overran and desolated those parts of Europe which by geographical position had escaped the predatory incursions of the Danes and Normans. And at a later period, when the Ottoman hosts threatened to overwhelm Christendom, Hungary was the bulwark of civilized Europe, the theatre upon which the wars of the Cross and the Crescent were hourly waged.

Those times are past; and to the rest of the world Hungary is now no more than a province of the Austrian empire; though certainly an important province, with a population superior to that of many modern kingdoms, being in round numbers twelve millions. Its history, therefore, which would once have commanded the universal attention of the reading public, can now hope only for such notice as its own independent and intrinsic interest may attract. That this interest is however by no means inconsiderable, needs scarcely be stated; for to what Christian heart can the country be indifferent, that so long struggled single-handed against the all-subduing Turks, and that, when it fell, fell a victim for the general safety.

But this is not the sole interest belonging to the land of the Magyars. It has produced splendid feats of heroism and romantic adventures, and has given birth to men in whom, however tainted with the vices of their age, the proudest country might exult. The aristocratic freedom and privileges of the Magyars themselves offer, even in the present day, a lingering remnant of feudalism; and the generous spirit with which they supported, and effectively supported Maria Theresa, when assailed by the rapacious and perjured sovereigns of Europe, may be termed the last gleam of European chivalry.

Graf (Earl) Mailáth who, in the volumes now before us, has made this land of vicissitudes and this lofty-souled nation known to Germany, is himself a Magyar, of a high family, serving their country officially

and with well-merited distinction. Earl Johann has preferred the service of the muses to that of the state; but even in his pursuit of "this idle trade" he has been actuated by patriotic impulses, and has made the fame of Hungary one of his great literary objects. As a poet he has translated her ancient Magyar poetry into German, as noticed in a former number;* he has collected her early traditions and legends; and he now stands forward in the graver capacity of her historian. In these various branches of literature Count Mailáth has earned the general esteem, as well of his Magyar compatriots as of the Teutonic literati. All his works are popular in Germany; and in the last volume of his history he speaks with gratitude of the favourable verdicts pronounced by the tribunals of criticism upon the preceding volumes, as they separately appeared.

To give in our narrow limits an analysis of these five volumes, unconnected with this country or with the political excitement of the day, is of course out of the question. But we conceive that a rapid survey of the history of Hungary, or rather perhaps of its tenour and character, in proof of our remarks, may be satisfactory to the reader. With such a sketch therefore we shall introduce the extracts that appear most interesting, characteristic, and national.

Count Mailáth commences his history somewhat abruptly, with the irruption of the Magyars into Hungary, taking no notice of their origin or former home. This omission, if omission it be, is amply atoned by the insertion, as an appendix, in three of his volumes, of dissertations translated from the Magyar of the national antiquaries, Georg von Fejer and Stephen Howath, and designed to prove that nation a branch of the Parthians or Turks. This is a topic important to the Magyars and to the investigators of such ethnological questions; but having adverted to it in the article already cited, we shall imitate our historian and begin with the occupation of Hungary.

In the year 889 the Magyars, under their leader Arpad, crossed the Carpathian mountains from Galicia and invaded Hungary, then parcelled out amongst several petty lords and princes. Some strategical skill the Magyars we are told even then displayed; inasmuch as they always detached a part of their army to fall upon the flank or rear of the enemy whom the main body attacked in front: this appears to have remained their favourite manœuvre so long as they had an independent army. It was in

* See vol. iii.

the ninth century more than sufficient for the conquest of Hungary, a conquest characterized rather by ravage and devastation than by open flight. From that moment, as stated, the Magyars under Arpad and his posterity overran, plundered, and desolated Germany, France, Italy, and the Greek empire as far as Constantinople, inflicting all the miseries attendant upon barbarian inroads. These horrors were first checked in the year 955, when the Emperor Otho the Great defeated the Magyars upon the river Lech, so completely annihilating the marauding host that, it is reported, only seven of the invaders survived to carry home the tidings of disaster.

Shortly afterwards began the conversion of the Magyars to Christianity, introduced here as elsewhere chiefly by female influence. The Christian dame Sarolta, herself a converted Magyar, who exercised this influence over her countrymen and their prince, her husband Geisa, was nevertheless the most extraordinary of lady missionaries, being addicted to the bottle, and occasionally, when angered, to the sword. Her power was such that she prevailed upon the Magyars to abandon their plundering expeditions, ally themselves with the Germans, and learn from them the arts of life. Waik, her son by Geisa, was christened by the name of Stephen, and married Gisala, a sister of the Emperor Henry II.* He was afterwards canonized, and is called by Mailáth "the greatest man Hungarian history can boast." St. Stephen sent an embassy to Rome to acknowledge the supremacy of the Pope, from whom he obtained a crown and the royal title, but to whom he conceded little authority in Hungary. He appointed bishops and marked out their dioceses; he founded churches, convents, and schools. He is said to have likewise given the Magyars a political constitution; but his laws are lost and forgotten: it is now only known that the monarchy was at once elective and hereditary, the individual king being freely chosen, but from the race of Arpad; that the nobles exercised much control over the royal authority, forming a sort of senate; that the administration was conducted by great officers of state with specific departments; that the country was divided as now into counties, each governed by a nobleman, with the title, first it is said of

Comes parochianus, then of *Comes supremus*, and lastly of *Obergespan*; that guilds and corporations, often composed of immigrants, existed with especial privileges; and that, whilst there was a class of free peasants, the lower orders were villeins or serfs. It rather seems that the nobles, even if bound to military service, did not hold their estates in vassalage; because it is mentioned, as a distinct condition of tenure, that the king granted lands attached to the royal castles in vassalage, and in consideration of military service, to an intermediate class of persons. Justice was administered in every county by the *Comes* in person; and the ordeal by fire or water, and judicial combat, were the usual modes of eliciting truth. In case of war the free peasants and communities were bound to send every tenth, or sometimes every eighth man to form the *banderia* or disposable force of the county.

After St. Stephen's death the claims of different candidates for the throne gave rise to civil wars, with foreign interference. The three sons of Bela, Geisa, St. Ladislaus, and Lambert, with disinterested virtue, refused the crown on account of the superior rights of Solomon, the son of Andreas I., their father's elder brother and predecessor; nor did Geisa II. accept it until Solomon had proved himself wholly unfit to reign.

The male descendants of Arpad sat upon the throne of Hungary for upwards of 400 years, viz. to the end of the thirteenth century. This was a period of incessant warfare; proceeding partly from Magyar attempts at conquest, many of the adjacent provinces being at different times subject to Hungary; partly from the interference of foreign powers in civil dissensions. The period was further distinguished by some remarkable events; as the crusades, and the steady advance of the Mongol hordes upon Eastern Europe, which threatened again to submerge just as it began to revive. Of both Hungary was in part the scene. The earliest crusaders repaired by land to Palestine, and traversed that kingdom. The disorderly rabble composing the first bodies committed all sorts of outrages, cruelly ravaging the country; and suffered as cruelly from the vengeance of the Magyars. But with Godfrey of Bouillon King Koloman negotiated the terms of his passage; Godfrey maintained strict discipline, and Koloman took care that the progress of the army should be unmolested, and their markets abundantly supplied. The few subsequent crusades that proceeded by land, were, like Godfrey's, under military government, and thence caused less evils.

It was during the reign of Bela IV., that

* Mailáth says a sister of Otho's, but no such sister of any of the Othos is known: Professor Luden, a most diligent inquirer, says a sister of Henry II.'s, and we have preferred his authority, as Mailáth is subject to mistakes in names and genealogies; for instance, calling Maria Theresa the grandchild of Joseph I., her uncle.

in the year 1240, the Mongols, after desolating the east under Gengiskhan, turned westward under his successors; and, led by his grandson Batou, overwhelmed, devastating and destroying almost without resistance Russia, Poland, Moravia, Silesia, and Hungary. The first check they experienced was in Silesia: Henry the Pious, Duke of Breslau, gave them battle with very inferior numbers, and although he was defeated and slain, his gallant example encouraged his countrymen; the towns closed their gates and manned their walls; the Mongols besieged them unsuccessfully as unskilfully, and penetrated no further westward upon this line. In Hungary they overspread the country, while internal dissensions paralysed the efforts of Bela to oppose them. He was defeated, and, escaping death only by the self-devotion of a few of his followers, sought shelter with his family in the furthest Hungarian province, Dalmatia. There and in Hungary some fortified towns successfully defied the awkward attacks of the Mongols. The death of Khan Oktay and the affairs of their own empire, rather than the resistance they encountered, appear to have determined the Mongols to return to Asia. Mailáth thus describes the state in which they left Hungary.

"In how horrible a condition did Bela, upon his return, find his kingdom!—For whole days' journeys not a human being; the wild beasts so increased in numbers and were so audacious, that by broad daylight the wolves ventured into inhabited villages, tearing children from their mothers, and even attacking armed men. Nowhere a field tilled; famine, with all its terrors, impending; sickness predominant. But great as was the need, commensurate was the energy of his counteractive measures."

Another remarkable event of this period was the wringing from the feeble Andreas II. a charter, bearing much analogy to our Magna Charta, to which it is little inferior, and subsequent but by a very few years. It is entitled the Golden Bull, and is, to this day, the law of the land; the constitution which, with the exception of one clause, every monarch at his accession still swears to observe. Count Mailáth considers the Golden Bull as superior to Magna Charta; and without entering into comparison, some points of the Hungarian document certainly deserve mention. The Golden Bull authorized the assembling of the estates of the kingdom, afforded security of person and property, ameliorated the condition of the lower orders, and sanctioned the forcible resistance of the subjects to misgovernment on the part of the king. This last is the clause

excepted from the coronation oath, and is probably unique; it being more extraordinary for the sovereign to concede the right of insurrection, than for the subjects to assume it; as did the Aragonese nobles by the celebrated "Si no,—no," (if not,—not,) of their oath of allegiance.

This period likewise produced monarchs distinguished by other qualities than their courage and military proficiency. We have already mentioned St. Stephen; we may add Bela I., who, in a three years' reign, did much for the internal prosperity of the kingdom; his son, St. Ladislaus, a conqueror and legislator, the benefactor of the church and restorer of its discipline; Koloman, who in those early and superstitious times prohibited the persecution of witches, "because witchcraft has no existence;" and Bela IV., who, in addition to his other merits, began the improvement of the judicial system, and restricted the use of the ordeal and judicial combat in legal proceedings. We cannot forbear extracting the noble historian's character of this Magyar monarch.

"Bela was certainly one of the greatest of rulers. His measures, equally energetic, comprehensive, and appropriate, saved the Magyar realm when upon the point of dissolution by the Mongol invasion. The rise of the towns, the repeopling of the country, a more regulated course of business, a fresh impulse given to the working of the mines; the ratification of popular liberties, in unison with corroboration of the regal dignity; security of the frontiers by alliances, augmentation of the revenue,* such are the unforgotten effects of his wisdom. 'A man full of virtue, whose memory, like sweet honey, lives in the mouths of Hungarians and of foreign nations,' says the old chronicler Turocz."

In 1301 died Andreas III., the last male heir of the Arpad dynasty; and the historian remarks that of the three-and-twenty kings from A. D. 1000, only Bela IV. lived to the age of sixty; these premature deaths, combining with attachment to the hereditary principle, render the accession of minors more frequent in the annals of half-elective Hungary, than perhaps of any purely hereditary monarchy.

Upon the extinction of the male line, an heir was sought in the female branch. Even when Andreas III., a collateral heir of the kings his immediate predecessors, was elected, Maria, the queen of Charles II. of Naples and grand-daughter to Bela IV., had

* It should perhaps have been earlier stated, that the public revenue of Hungary was derived from taxes, the nature of which seems to be quite unknown, from customs and tolls, as well as from crown lands.

claimed the crown for her son Charles Martel; and the Pope had, somewhat precipitately, conferred it upon him. Death prevented Charles Martel from enforcing his pretensions against Andreas; but when the throne was actually vacant, his son, Charles Robert, protected by the Pope, repaired to Hungary, and though not fifteen, contended with his rivals for the crown so strenuously and successfully, that after several years' struggle, he carried his election, and in 1310 was crowned at Buda.

Charles Robert's reign was for Hungary uncommonly long, being thirty years from his coronation; and his posterity continued, with a short interruption, to rule for upwards of 200 years, in fact as long as Hungary remained independent. In 1526 the unfortunate battle of Mohács against the Turks destroyed the forces of Hungary; and by the death of the young king, Lewis II., without children, made way for the election of his sister's husband, the Archduke, afterwards the Emperor Ferdinand I., who incorporated Hungary with the other dominions of the House of Austria.

This period like the former is full of wars, foreign and civil. The foreign were occasioned first by schemes of conquest and involvement in the affairs of Naples; afterwards also by the necessity of opposing the progressive preponderance of the Ottoman arms: when Hungary appeared as the bulwark of Christendom. The civil wars originated chiefly in contests for the crown. Like the former, this period produced some great men; of whom may be mentioned Charles Robert himself, an able, and generally speaking a prosperous ruler, although he greatly augmented the power of his patrons, the popes, in Hungary; his son, Lewis I., called one of Hungary's greatest kings, who added Poland, Red Russia, Moldavia, and part of Servia to his hereditary dominions; John Hunyadi and his son Mathias Corvinus.

Hungary was now no longer an independent kingdom; but its history, in some measure independent, does not cease simultaneously with its separate existence. Although Ferdinand was twice elected King of Hungary, the whole nation did not acknowledge him; rebellions and civil wars, envenomed by religious dissensions, followed; Transylvania, under the ambitious John Zapolya, aimed at independence; he and his successors even preferring vassalage to the Porte when the alternative was submission to Austria.

Favoured by these internal feuds that paralyzed resistance to the common enemy of Christendom, the Turks pursued their victorious career more successfully against Hun-

gary under the Imperial House of Austria, than as a single, unassisted kingdom. They now reduced three-fourths of the country so completely, that the national division into counties was changed for a Turkish division into *Sangiacks*, all placed under the supreme authority of the Pasha of Buda. It was only under the Emperor Charles VI., in the early part of the eighteenth century, that the whole of Hungary was finally and completely recovered from Ottoman domination; and it is with the accession of Charles's daughter, Maria Theresa, whose wise and maternal government conciliated even the most turbulent of the Magyars, that Count Mailáth considers the separate history of Hungary as terminated. He concludes his narrative of heroism, chivalry, and romance, we must say unpleasantly to our feelings, by calling in question the celebrated, generally-believed, and heart-stirring burst of Magyar enthusiastic loyalty, "*Moriamur pro rege nostro, Maria Theresa!*"

During the early part of this period it may perhaps be thought that the character of Hungary as the bulwark of Christendom, was merged in that of the victim; but still, at least negatively, it served in the former capacity. It formed the boundary line beyond which the stormiest tide of Ottoman conquest advanced no further westward; once only a vigorous effort at such advance was made, and it ended in the memorable siege of Vienna, raised by the gallant King of Poland, John Sobieski, with the utter discomfiture of the Osmanlis. Nor was this the only memorable siege, the only heroic exploit achieved in the continuous war against the intrusive Turk. The desperate resistance of several Hungarian towns, though seldom successful, still affords the mind of the reader some relief from the sense of depression that steals over it, whilst dwelling upon the details of misgovernment of paltry and ill-advised ambition, and the disastrous results.

But perhaps the most remarkable incident belonging to these two centuries of struggle between Austria and Turkey for Hungary, relates to the religious vicissitudes that occurred there. The Reformation had struck root so firmly amongst the people, was so rapidly and so widely spreading, that *Magyar-Orszag*, as the Magyars denominate Hungary, seemed upon the point of becoming a completely Protestant state, when the sheer intellectual energy and eloquence of one man, the Jesuit, Pazman, reconverted almost all the higher orders to Catholicism.

This period likewise produced some remarkable men, whose names well deserve to be recorded. Pazman was born of a noble, though not wealthy family, was edu-

cated in Calvinistic principles, and became a Catholic at thirteen, a Jesuit at seventeen years of age : his success as a missionary preacher has been told. But this is not the only Hungarian name entitled to a better fate than oblivion. Stephen Bocskai and Bethlon Gabor were endowed with the qualities which should have made men as good as they were great and real benefactors of their country, had they not suffered themselves to be impelled by an ambitious, a factious and sectarian spirit to attempt an impossibility, namely, the independence of a mere province ;—and in the prosecution of the attempt to throw themselves into the arms, or more properly speaking, under the feet of the enemy of their faith, instead of using their ascendancy to procure fair terms of union for Hungary and Transylvania with Austria, including toleration for their various sects and shades of Protestantism. The later insurgents, the Rakocskis and Tököly in Transylvania, and Zrinyi, &c. in Hungary, were in comparison with these men little more than romantic adventurers. They all offer rich matter to the historic novelist, and as such have been used by Bronikowski,* and made known to our readers.

We now offer some specimens of Magyar history, as also of Magyar historians. The early account of these Magyars, their heathen religion and customs, contained in the first volume of the work before us, has been noticed on a former occasion,† slightly indeed, yet sufficiently to prevent our now attempting a more detailed analysis. We therefore proceed to a later period, and select the portion of the Turkish wars which embraces the lives of the two Hunyadis. We begin with an extract which Mailáth gives from a contemporary narration, illustrative of the state of the country, of the individual misery resulting from Turkish aggression, and of the singular adventures to which it gave birth. In one Turkish inroad, about 1438, 70,000 Transylvanian captives were dragged away to slavery ; and our author thus proceeds,

“From amidst the mass of these unfortunates one figure stands forward, claiming our attention, our sympathy. It is a youth who was made prisoner at Mühlenbach, and who, returning home two-and-twenty years afterwards, faithfully and intelligently described the manners and customs of the Turks. His name is unknown ; he calls himself only the Teacher of the Transylvanians ; and in the writings of the day is often referred to as the Mühlenbacher, from the place where he was captured. His adven-

tures cannot be more attractively given, than as told by himself in the ingenious preface to his Description of the Turks. After briefly mentioning their invasion of Transylvania, he thus proceeds : ‘ At this time I was a lad of fifteen or sixteen, a native of this province. and had a year previously quitted the town in which I was born ; repairing, for the purpose of study, to a small town called in Hungarian Schebesch, in German Mühlenbach, which was then populous enough but not as well fortified. Therefore when the Turk came, and encamped, he at once prepared to storm. The Duke of the Wallachoben (Wallachians ?), who had accompanied the Turks, on account of an old friendship between him and the inhabitants and citizens of this town, drew nigh to the walls, makes peace, calls upon the citizens, and persuades them to follow his advice, which is, not to contend with the Turks whose might they were too weak and too few to resist, but to surrender peaceably ; in which case he would obtain leave of the Turk to take the higher classes, unharmed in property, home with him to his own country, leaving it to their free choice to stay with him or return to Hungary. The rest of the people the Turk would take with him to Turkey, without injury to person or property, and there give them a country to possess and remain in at their pleasure, or allow them to go away in peace undeceived and undetained. All this was done according to engagement. Thus was the war appointed for the morrow,* that each might prepare his property and family, to depart in peace with the morrow.

“ ‘ One high-minded nobleman, who had been commandant of a castle, with his equally high-minded brother, who had fought much against the Turks, would by no means follow this advice, but a hundred times rather die than surrender himself, his wife and children, to the Turks,† and he persuaded many to adopt his opinion. They made choice of a tower into which the whole night long they carried provisions, arms, and all requisites for defence, fortifying it as they best could ; with them I entered the tower, awaiting with earnest desire rather death than life.

“ ‘ In the morning the Grand Turk came in person to the town gate, and commanded that every one who came forth with wife and children should be registered by name, and kept under guard, to be conducted to

* We confess to being perplexed by some sentences, here and further on, but whether the puzzle rests with the old Transylvanian or his German translator, if indeed the original be not German, we know not.

† We must state, in vindication of the course adopted by this high-minded nobleman, that the capitulation here detailed is pretty nearly a solitary instance in Mailáth’s volumes of a capitulation honourably observed by the Turks. The tale of surrender is so generally followed by that of the murder of the disarmed garrison, that the reader begins to wonder what circumstances could tempt any one to treat of submission.

* See vol. xiv.

† See vol. iii.

Turkey, without damage of person or movable property. He recommended it to the Duke of Wallachia in the above-mentioned manner to guard the citizens and authorities of the town and take them into his own country.

"The whole army, getting no booty from these people, now turned with unanimous frenzy against the town in which we were, and ran at it to storm it, in the hope of finding much to plunder amongst us. What an assault, what a tempest there was, no tongue can sufficiently say; such a thickness of arrows and stones that it was thicker than rain or snow to look at; such a shouting of warriors, clashing and clanging of arms, and crackling and rushing of assailants, as though heaven and earth were breaking at one instant. Now as the town was not very high, they easily crushed and destroyed the roof-work and upper rooms, so that nowhere (*niedert*—in this an obsolete word, a provincialism, or a misprint?) could we stand safe for the arrows and stones; but they could make nothing of the walls on account of their strength. When now the afternoon sun tended towards setting, and nothing was yet accomplished, they took counsel that some should not neglect the storming the tower, whilst others should bring wood, with which they built up such a bastion as well nigh equalled the tower in height. This they enkindled, baking and scorching us like bread in an oven. When now almost all were melted and dead with the fire, and they perceived that nobody stirred in the tower, they tore away the fire, and broke in at the door, to see if there were any half dead whom, refreshed and revived, to drag away. Thus half dead they found me; recovered, and sold me to a trader, who chained me to other prisoners, soldered on my fetters, and so drove me across the Danube to Adrianople, where the great king then made his residence. Now from the above-mentioned year 1436 even to the year 1458, I bore the heavy burthen and intolerable anguish of this most hard and miserable captivity, not without danger and detriment to body and soul. In this time I was seven times sold, I ran away seven times, was seven times retaken, and purchased with money; accordingly I became so accustomed to their barbarous speech that, forgetting my mother tongue, I learned their observances and their writing, so that they would have given me a post in their Church of no small consequence and income. I have also known more of their creed, by writing and in my head, and known better to speak of it than themselves, so that not only my neighbours, but deputations sent from distant lands, and much people came to hear me, also many priests. To my last master I was as dear as his own child, as he often acknowledged and also proved. When I was already free, he would fain have kept me with him as a free man; his whole family prayed me; I was at last obliged to excuse myself craftily, making as though I would visit an university and return, which they conjured me to do in the name of God and

their Mahumed. So should I go back, and with my imperial letter of liberty, I came away over the sea, God be praised!"

We are now to explain the circumstances under which the Hunyadis first appear in history. The emperor Sigismund who had married Maria, eldest daughter of Lewis I. and heiress of Hungary, and who had latterly governed in her name, upon her dying without issue, was elected king; he bequeathed the crown to Elizabeth, his daughter by a second wife; and her husband Albert, Archduke of Austria, was elected king in acknowledgment of her right. Albert died in 1439, leaving two infant daughters and the prospect of a third child. The widow, unambitious by nature, and depressed by the loss of her husband, shrank from the troubles of the times. She assembled the Estates, informed them that she felt herself unequal to wield the sceptre though hers by right, and was convinced that her unborn babe would prove another girl; wherefore she advised them to elect a king. The crown was accordingly offered to Wladislaus, King of Poland, the son of Maria's younger sister, Hedwig, and consequently the right heir of the Angevine-Arpád line. Elizabeth, being delivered of a son, revoked her precipitate abdication, and caused her infant boy to be immediately christened Ladislaus and crowned; but she could not wrest from Wladislaus the power she had rashly surrendered. She fled to Vienna with her son and the crown of Hungary; committing both to the guardianship of his nearest kinsman, the Emperor Frederic III. The Emperor made no exertion on behalf of his ward; and though the realm was distracted with civil war until 1442, when Elizabeth's death left her party without a head, Wladislaus was from the first actually king, and with him rested the defence of the country against the Turks. John Hunyadi was his general.

The services of Hunyadi were early rewarded by Wladislaus with the appointment of *Woiwode* of Transylvania; but the care of this large province interfered not with his military duties. He twice defeated the Osmanlis upon Hungarian ground; then, leading across the frontiers an army, to the assembling and equipping of which he had largely contributed from his own resources, he gained five pitched battles and took several fortresses in the provinces already subject to the Crescent. A letter written by the victorious general in the midst of his successes to his friend Niklas Ujlak has been preserved, and is thus given by our historian in its native devout simplicity.

"God is to be praised and glorified for his great mercies bestowed upon his Christian people : and so, after the battle, we gave thanks to God, and we brought to the king's majesty the banner of the enemy, and our prisoners. He received both piously, and gave God thanks. But the Emperor Amurath himself is now only three days' march distant from us, so that it is no wise possible but that we must fight with him, and what must befall God knows already, for we are in God's hand. What God wills, be the event ; once we must die, and especially for the faith."

The Turks now proposed to treat ; and the victorious Hunyadi, disappointed by the lukewarmness of the great Christian powers in his plans for expelling the Moslem from Europe, strongly recommended the measure. A truce for ten years was accordingly concluded in July, 1444, the Turks agreeing to restore all the Servian fortresses within a given time. And now we have to relate one of those disgraceful acts of sanctioned perfidy which but too often disgraced the Church of Rome in the darker ages, and still traditionally bring down upon her the reproaches of her enemies. But with the crime, we have to relate its signal punishment. Soon after the signature of the truce, circumstances peculiarly favourable for attacking the Turks occurred ; and Count Mailáth, himself a professed Catholic, thus narrates the result.

"Cardinal Julian advanced the doubly erroneous principle that a promise to unbelievers was not to be kept, and that Hungary was not authorised to make peace without the consent of the Holy See and the other allied Powers. He determined the king to break the treaty just ratified by oath ; and made him swear by his royal word and honour, by the Christian faith and holy baptism, by the hope of immortality, by the most holy Trinity and the most glorious Virgin Mary, and by the sainted kings of Hungary, Stephen and Ladislaus, that he, the king, would begin hostilities on the 1st of September.

"The same oath was taken by most of the grandees of the realm ; amongst others by John Hunyadi. To him the supreme command of the army was intrusted, and Bulgaria promised in writing as a kingdom. The commencement of the war was deferred till the 1st of September, because in the interim the Turks were bound to restore the Servian fortresses.*** With 10,000 Hungarians, 5,000 Poles and Crusaders, little artillery and much baggage, (2,000 waggons were counted following the army,) the king marched from Szegedin. He crossed the Danube at Orsowa and turned towards Widdin, where he was joined by Hunyadi with 5,000 men from Transylvania.***

"Arriving before Nicopolis the Hungarians

fruitlessly assailed the town ; for a regular siege they had neither artillery nor time, and thus was the reduction of this, in a military point of view, important place, omitted. Whilst the king was encamped before Nicopolis, Drakul Prince of Wallachia appeared with 4,000 auxiliaries, but earnestly dissuaded further advance. The Sultan's hunting-train was larger he said than the king's whole army. When his advice to return with all dispatch to Hungary was rejected, he pressed upon the king, against his time of need, two swift horses, and two Wallachians of tried fidelity, whom he prayed him always to have near his person."

For awhile the king with his 24,000 men, advanced prosperously, took towns, slaughtered Turks and delivered Christian slaves. But the Ottoman government was not idle. Amurath or Murad, whom Mailáth terms "the greatest and most humane of Ottoman sovereigns," at the age of forty had abdicated in reliance on the peace, and had retired to Magnesia to enjoy himself.

"When tidings of the breach of treaty reached Asia through the despot of Servia, the viziers and beys of the sixteen-year-old Sultan thought him unequal to the impending storm, and implored their old master with his secure hand to resume the command. Murad rapidly assembled the army, and advanced to the Hellespont ;—the sea swarmed with Christian ships, amongst which an hundred and twenty-eight galleys majestically and formidably towered. The passage could be neither forced nor stolen ; it was purchased. The Christian fleet retired, compelled, as the leaders asserted, by storms and want of provisions ; and the merchants of Venice and Genoa betrayed the cause of Christendom for gold. Murad paid a ducat a head ; and in one night 40,000 Turks were transported from Asia to Europe.***

"The Hungarians encamped near Varna, and in the evening saw the whole northern sky reddened ; it was the glare of the watch-fires of the Turkish host, [of whose approach they knew nothing,] encamped upon a range of hills not far distant."

The details of the battle of Varna, in which the great hero, John Hunyadi, was defeated, and the king lost his life, do not add anything important to the narratives of historians regarding that event.

Ladislaus Posthumous was now, upon the death of his successful rival, universally acknowledged king, but as he was still a child, John Hunyadi, upon effecting his escape from his Wallachian confinement, was named Gubernator, or administrator, by the estates of the kingdom. Mailáth says,

"The land needed a powerful ruler ; for during the long contest for the crown, and

the masterless state consequent upon the death of Wladislaus, disorder had risen to a high pitch, and outrages were everywhere perpetrated.**** Masterless rabble, soldiers without pay, ruined men reduced to despair, united, forming a band the leaders of which were freely elected. In their organization must have been something mysterious and strict, for they were compared to monks. They conquered many strong castles, gained others by fraud, and built others. Plundering and ravaging, murdering and burning, they prowled in all directions.

"Under such circumstances justice naturally suffered most. Hunyadi therefore administered justice whenever a complaint came before him, in his progresses through the realm. His exertions to re-establish law and justice were so striking, and so uninterrupted, that the historians of his day quaintly describe them by saying, "Sitting and standing, walking and riding, he administered justice." He appointed excellent men to the widowed churches, and incessantly urged the pope to confirm as bishops those whom he knew to be the fittest for the office. He likewise regulated and improved the coinage."

But the main business of the Gubernator was with enemies domestic and foreign; the Turks included. Of war in this history, we have, and must have more than enough; suffice it therefore to say that in 1452, he delivered over his kingdom to Ladislaus, in peace at home and abroad; and the first act of the young monarch was to heap honours and wealth on him who had so well deserved them at his hands. Ere we again return perforce to scenes of broil and battle, a sketch of the young king's life at Vienna under Ulrich Cilly's tutelage, as given by Count Mailáth from the pen of the legate Eneas Sylvius, (afterwards Pope Pius II.,) and therefore characteristic of the times and country, may afford an agreeable variety.

"In the morning, as soon as the king is up, boiled nuts are set before him, with old Greek wine, that is called Malicatico: then he goes to church, and hears mass publicly: thither and back he passes through crowded multitudes of men, that he may not appear to love solitude, like his uncle the emperor. Upon his return roasted birds, pastry, and country wine are set before him, but he does not drink, that he may repair to council with a clear head. His dinner is rich and luxurious, at least twelve dishes, and those Austrian wines which are deemed most spirituous. Parasites, buffoons, guitar-players, and songstresses are admitted; those who most endeavour to please, lampoon the emperor, praise the king, and extol the count's (Ulrich Cilly's) deeds. When there has been enough of dancing and singing, he takes an afternoon's nap. Upon his

waking, a refreshing draught is presented to him, with apples or preserved fruit. He then goes to the council, or rides into the town and visits the ladies, married and single, most renowned for their beauty. When he returns home supper is served, and often prolonged into the night. At going to bed wine and apples are again set before him, and he is urged to eat even against his will. Thus is his day allotted. Many blame this, especially censuring the Earl who regulates it all. Others so hate the emperor that they praise whatever is opposed to his mode of life. But the youth's good disposition will not be corrupted by these seductions. He bears manly earnestness in his young breast, drinks not, eats no more than needful, speaks little, abhors what is shameful, rebukes those who lampoon the emperor; says that he has been well off with that prince; calls his uncle holy and moral, and behaves in all things so as to give promise of a wise ruler."

The war with the Turk was now Hunyadi's chief occupation, and whilst he waged it with varying success, Ladislaus listened to his enemy, Cilly; now consenting to the hero's ruin, now again seeking his friendship. The last exploit of John Hunyadi was forcing the Sultan in person to raise the siege of Belgrade; and upon this occasion he had the aid of an ally very characteristic of the age and of that remote part of Europe. Count Mailáth thus depicts him and his proceedings.

"Whilst the estates of the realm were assembled at Buda, a Franciscan monk came thither, a little old man, lean, withered, mere skin and bone; but indefatigable in labour, ever confident, satisfactory to the wise, intelligible to the ignorant, swaying the hardest hearts; this was John Capistran. Sent from Italy by the pope to preach a crusade against the Turks, he had traversed Austria, Bohemia, Poland, and reached Hungary, where the danger was greatest, the need most urgent. Bishops and communities wrote, praying him to gladden them with his presence; thousands awaited him when he came, thousands followed him when he went. The sick recovered when he prayed; when he preached, which was daily, twenty and thirty thousand hearers thronged round him. Priests and monks, beggars, peasants, and students, took up the cross. Guns, bows, and slings, pikes, and flails, swords, scythes, whips and hatchets, were their arms; a wondrous army of 60,000 enthusiasts clamoured round the seventy-year-old greybeard.

"John Capistran joined the regular troops summoned by Hunyadi. The saint and the knight of Christendom marched together against the heroes of Islam."

In justice to Giovanni di Capistrano, so

named from his birth-place in the Abruzzi, and of whom Count Mailáth speaks somewhat slightly, it should be stated that he was not, as might be supposed, a mere enthusiast working sympathetically upon the fanaticism of his hearers, but a man of extraordinary erudition, and in those days highly renowned for his success in polemical divinity. Previous to undertaking this crusade, he had combated with his pen almost every heresy then disturbing the Catholic Church.

Hunyadi attacked and defeated a part of the besieging host, and entered Belgrade with his army: the monk's bands there proved, as was to be expected, unruiny; but their disobedient rashness appears to have been most beneficial in its results.

"Hunyadi, a prudent commander, stationed his troops in the town, and forbade, on pain of death, any person to venture outside the walls, the Turks being still too numerous. His troops obeyed, not so the crusaders; singly, in small or large bodies, they sallied forth, and fell upon the Turks. Five crusaders were assailed by a disproportioned number of Turks; they defended themselves with arrows, others hastened to their assistance, and thus gradually commenced a skirmish, that grew more and more considerable, more and more serious. When Capistran saw this, he led in person the remainder of the crusaders to the battle; himself unarmed, in his hand only a staff on which was carved the sacred sign of the cross. Hunyadi then moved out with his troops, either to decide the victory, or protect the crusaders if beaten. The Turks fought like desperate men, Mohammed himself like a hero as yet unacquainted with defeat. But the crusaders pressed on more and more irresistibly; the Turkish works were stormed, the Sultan himself was wounded: the whole army fled in wild disorder, carrying their bleeding sovereign along with them: only at Adrianople could he check the flight, by the execution of some of the most considerable leaders. In the siege, battle, and flight, 50,000 Turks perished. The booty of the victors was immense, the exultation of Christendom unbounded.

"But the joy of rescued Hungary was soon turned to mourning, for twenty days after the victory died John Hunyadi. When he felt the approach of death, and the holy sacrament should have been brought to him, he suffered it not; but caused himself to be carried to the church, there to receive the body of our Lord. He expired immediately afterwards, at the age of fifty-six, in the arms of Capistran, his friend and companion in arms. The greatest man Hungarian history can boast, a man throughout blameless and admirable, if he had not been sometimes cruel. Soon after the hero's death Capistran began to sicken. When King Ladislaus came to Belgrade, he was already very fee-

ble; the King twice visited him. The first time Capistran could advance to receive him; the second he could not rise from his bed; but with words full of unction he admonished the king to protect the Church and lead a pious life. This done he presently expired."

Soon after this a brawl between Ulrich Cilly and Ladislaus Hunyadi, the eldest son of the deceased hero, and in which Cilly was the aggressor, ended in his death. The king pardoned the dead, and professed to the widow of Hunyadi the utmost regard for herself and her two sons. But under this show of good will, having got both brothers into his hands, he caused the elder to be publicly beheaded, and kept the younger, Mathias Corvinus, in close custody. The bereaved mother and widow, in conjunction with her brother, Michael Szilagyi, armed their friends, levied troops, and prepared for hostilities; but in the midst of their preliminary operations an inflammation of the bowels suddenly carried off King Ladislaus, a very few months after the execution of Ladislaus Hunyadi.

The party of the Hunyadis, armed and unarmed, now increased daily; and by the aid of his troops, Szilagyi succeeded in procuring the election of his nephew Mathias Corvinus, who, in January, 1458, was proclaimed King of Hungary.

Mathias was then a lad of fifteen, and this is a yet more extraordinary instance of the election of a minor, than when the choice fell upon the natural heir of a deceased king. Szilagyi was at the same time appointed Gubernator for five years. The new monarch was at the moment of his elevation a prisoner at Prague; but the powerful George Podiebrad, subsequently elected King of Bohemia, immediately released him; first however bestowing his daughter Catherine upon him in marriage.

Mathias was, and still is, considered by his countrymen as the greatest king that ever reigned in Hungary; and a compatriot opinion thus unanimously entertained by contemporaries and posterity must have great weight. The faults that we feel as painful drawbacks upon his really great qualities, chiefly an ambition unmarked by principle and a tendency to arbitrary measures, were the faults of his age and country; sympathy prevented their being then felt as defects; and conduct instigated by sentiments then deemed generous and exalted, should not in fairness be measured or appreciated by the more philosophic standard of the nineteenth century.

Almost the first act of Mathias displayed this ambition, and its recklessness of all re-

straining ties. He was impatient of the authority of the uncle to whom he mainly owed his crown, and threw him into prison. Szilagyí effected his escape; and Mathias, whose object was now accomplished in the possession of the full regal authority, blushed at his own ingratitude, and was reconciled to him.

The young monarch next turned his thoughts to the organization of an army; and in the edict he published upon this occasion, originates the name still borne by one description of troops. He ordered every twenty military vassals to furnish a warrior; and we learn from Mailáth that "the man thus furnished was called a *hussar*, from *huss*, twenty, and *ar*, price." Whether the original law for the service of the tenth or eighth man had become obsolete, is not, that we can find, stated.

Mathias had abundant occasion for the army thus organized. The Turks were still in arms; but before he could make head against them he had to oppose a combination of domestic and foreign enemies. His election had not been unanimous; and the friends of the Cillys, with all other adversaries of the Hunyadis, now tendered their allegiance to the Emperor Frederic, who had the crown of St. Stephen in his possession. The mediation of the Pope and of King George Podiebrad of Bohemia, aided by the growing reputation of Mathias, and the equally growing danger from the Turks, induced Frederic in the end to abandon his pretensions. The king first quelled the insurgents by arms, and then turned his attention to the Turks. His first campaign against them is thus described:

"Mathias Corvinus now drew the sword. To the frontier commandants was enjoined the utmost vigilance during the time that he was assembling his troops. Whilst the king proceeded to the Save, much fighting occurred upon the frontiers. The inroads of the Turks extended as far as Futak, which with difficulty resisted these marauders. Michael and Peter Zucholi fell upon them; Ali Beg, who frantically defended himself, was constrained to fly. Near Temeswar 4000 Turks, driven back on all sides, were slain. Mathias crossed the frontiers, and marched straight upon Jaiesa, (the capital of Bosnia, just conquered by Mohammed,) which was garrisoned by 7000 Turks. The commandant, Haram Beg, held out for a month and a half. The king's perseverance triumphed over the obstinacy of the enemy and the severity of the season. The young monarch entered Buda as the conqueror of a kingdom and deliverer of 15,000 Christian prisoners. Haram Beg and the captive Turks enhanced the splendour of his triumph.

"Mohammed, incensed at the fall of Jaiesa,

resolved to recover it. With immense numbers he appeared before the walls; the cannon thundered unceasingly; and when the fortifications were deemed sufficiently shaken, the Sultan divided his host into three parts, assigning to each a day for storming. The garrison resisted the three days' fury. The Turks were discouraged; and when Emerich Szekheli approached to relieve the town, the report that Mathias in person led the advancing army, multiplied its numbers. The Sultan raised the siege; and so precipitate was the retreat that many guns with a great quantity of baggage was left before the town, and fell into the hands of the Hungarians."

Whether Mathias ever entertained his father's projects for expelling the Turks from Europe, does not appear. In fact he himself, like the other princes of Europe and even the then spiritual head of Christendom, the Pope, though regarding the Osmanli with hatred, seems to have been scarcely sensible of the magnitude of the danger from the warlike and enterprising temper of these new intruders into Europe; otherwise they would not have suffered every petty private interest to divert them from the common object. This, to Mathias in particular, should have been a paramount consideration; yet the pursuit of a second kingdom was preferred by him to the defence of that in his possession.

Papal intolerance induced the revocation of the indulgences previously granted by the Roman See to the Utraquist heretics of Bohemia. George Podiebrad, though himself an orthodox Catholic, interfered on behalf of his subjects; and the Pope, Paul II., in consequence deposed him, offering his crown to his son-in-law Mathias. His beautiful and beloved young queen, the daughter of George, was no more; she had died childless; and although his attachment to her memory long prevented the widower from marrying again, it had not the power to restrain his ambition. He accepted the Pope's offer and invaded Bohemia. The commencement of hostilities is thus described:

"Mathias encamped near Laa on the March. He was received with rejoicings by the citizens, as the Emperor's ally; the arsenal was opened to him, and provisions were abundantly supplied. On the opposite bank of the March encamped Podiebrad. Thus they remained for a whole month, without striking a decisive blow. Alike in talent for war, courage, prudence, and military equipment, they were unlike in age, and the qualities of their armies. Podiebrad was sixty, Mathias hardly twenty-five. The Bohemians were the most renowned infantry in the whole world, the Hungarians were formidable from their numbers and the boldness of

their cavalry. The resources of the two princes were equally various. The king of Hungary had the Pope and the Emperor for allies, and was supported by the Catholic Bohemians: but mighty foes were rising behind him, and his own subjects reluctantly saw themselves involved in an expensive and destructive war. Podiebrad had no adherents except the Utraquist Bohemians, but these were fired with the wild fanaticism of religious enthusiasts.

"The two princes frequently saw each other on the banks of the river, and conversed, sometimes in wrath, oftener in recollection of past friendly times. At length the principal men on either side endeavoured to mediate a peace; but the Cardinal Legate Lorenzo, in Corvinus's camp, interposed; the Prince of Peace became the Apostle of Discord, and the negotiations were broken off."

The war was hard fought on both sides. Mathias made great progress in Moravia and Silesia, but none in Bohemia, which however he invaded with increased forces, laying all waste with fire and sword.

"Podiebrad now proposed peace. The two kings met; they conversed alone, and the Cardinal Legate, who accompanied Mathias everywhere, dreaded the conclusion of peace. This however was not accomplished, but a truce only settled. The kings parted, and Podiebrad's sons, Victorin and Henry, accompanied Mathias to Olmütz. There the Cardinal Legate suggested to the king that he might end the war at a stroke by making George's two sons prisoners; but Mathias indignantly rejected the advice. At the end of the truce Mathias held a diet at Olmütz, at which he was proclaimed king by the Bohemian Catholics; whether he was likewise crowned, is doubtful. Whilst Mathias visited the chief Silesian towns to receive homage, Podiebrad held a diet at Prague, for the election of a king. It was generally expected that he would propose one of his own gallant sons; but he passed them by, and recommended Wladislaus, the eldest son of the Polish King Casimir, to the Bohemians. The proposal pleased them, and they offered Wladislaus the succession to the crown, but upon conditions."

These conditions were, their own and their king's reconciliation, through him, with the Roman See, the ratification of their privileges, ample princely provision for Podiebrad's family, and Wladislaus's marriage with the daughter of the latter. Podiebrad's death shortly followed; Mathias and Wladislaus were severally proclaimed King of Bohemia by their respective partisans, and the war continued.

"Whilst Mathias was striving to conquer a new kingdom, he was on the point of losing his own. The Hungarians, dissatisfied with his arbitrary government, disliking the Bo-

hemian war, which exhausted the strength of the country, and left it, on the other side, exposed to the incursions of the Turks, turned to Casimir, King of Poland, and asked his second son, Prince Casimir, for their king. The oldest friends of the house of Hunyadi, even Vitéz, Archbishop of Gran, fell off from Mathias; of the seventy-five counties into which Hungary was then divided, only nine, of the grandes only the Archbishop of Kolocza, and the Palatine, remained true to the king. * * * Mathias, informed by the Chapter of Gran of the danger menacing him, hastened back to Hungary, and held a diet at Buda, by which he regained most of those who had fallen off from him. * * * Casimir vainly expected to be joined by the Hungarian grandes who had visited him, for the Buda diet had borne good fruit. * * * Casimir feared to be besieged by Mathias in Neutra; he left 4000 men to defend the castle and fled, unpursued, yet with such hurry that sixty waggons fell into the hands of the peasants."

Mathias now sought to conciliate the Archbishop, who had been the chief promoter of the attempt to supplant him; but when he had completely cleared his realm of all the Polish invaders, he turned upon his ecclesiastical enemy, confined him in one of his own archiepiscopal castles, and transferred the management of his diocese to the Bishop of Erlan. He then returned to the invasion of Bohemia; where his strategical abilities prevented his rival's deriving any advantage from his very superior numbers. A truce for a year and a half suspended hostilities, leaving each in possession of what he held.

Mathias had now leisure to attend to the incursions of the Turks, who, during his Bohemian wars, had constantly infested Hungary, ravaging the country, and carrying away sometimes 10,000, sometimes 50,000 victims to slavery. He defeated them on their own ground, and took the fortress of Shabacz. Yet so far were the Turkish marauding expeditions from being ended, that we are told the king's new bride, the Neapolitan Princess Beatrice, whom he married in 1476, "saw everywhere upon her road the most recent traces of Turkish devastation, and often passed the night there, where the Turks had raged during the day."

Again was Mathias diverted from his task as champion of Christendom, by wars with his Christian neighbours, Wladislaus and the Emperor Frederic. A peace was, however, mediated with the last-named enemy, by the Pope, Venice, and Mathias's Queen, Beatrice; and the Emperor confirmed to the King of Hungary the kingdom and electorate of Bohemia. In point of fact, however, the kingdom was divided between the rivals, both

of whom bore the title; whilst Wladislaus held Bohemia Proper, Mathias Moravia, Silesia, and Lusatia.

In the last invasion of Hungary by the Turks during the reign of Mathias, two circumstances are worth noting. One of the leaders against the Moslim, Paul Kinizsy, Earl of Termes, was humbly born, and promoted by merit alone. He was the son of a miller; served as a common soldier in these wars; and having distinguished himself by headlong audacity and extraordinary bodily strength, was raised by the king to this high rank of nobility—a proof that, even in the feudal times, the barriers of birth were not actually insuperable to merit. The nature of the other circumstance is illustrative of the then state of civilisation in Hungary.

“As the Turks broke in, Stephen Batori, Woywode of Transylvania, called upon Paul Kinizsy, Earl of Termes, for assistance; whilst, with the warriors whom he could hastily collect, he at once threw himself before the plundering bands. He engaged them on the Brotfelde, (in Hungarian, Kenyérmező.) Such was the Ottoman superiority in numbers, that the Christian soldiers, like martyrs, prepared for death by receiving the eucharist. Batori drew up his army in two lines, the Szeklers* formed the right wing in the first, the Saxons the left, and he himself with the heavy horse, and the Bishop of Transylvania's people, was in the centre. The Wallachians and Hungarians formed the second line. One of the most desperate of battles began: three thousand Saxons lay dead on the field or in the waters of the Maros; the Szeklers gave way, the Woywode led to the combat all that remained able to fight; two horses were killed under him, his blood streamed from six wounds; when, behold! at the highest, the utmost need, Kinizsy appeared! Like a maddened lion, in each hand a sword, the man of giant's strength dashed in amongst the enemy. He cut himself a path thither where Batori was fighting with dying exertions: the victory was won, thirty thousand Turks strewed the field of battle. The released captives mingled in exulting thankfulness with the victors, and revelled in the plenty of the hostile camp.

“Upon the corpses of the slain Turks the conquerors spread their meal, whilst they sang extempore songs in praise of their generals. They danced amidst the dead bodies. Kinizsy was challenged to join in the round. With herculean strength he seized a dead man with his teeth, so lifted him from the ground unaided by his hands, and with the corse hanging freely, waltzed in the circle, to the astonishment of all the spectators.”

* The Szeklers, one of the races or tribes found in Hungary by the Magyars, occupy part of Transylvania, which, in another part, has been colonized with Saxons.

Perhaps few things are more remarkable in the life of this king than the splendour he maintained amidst all these incessant wars; which, with the exception of the Turkish, his subjects reprobated, and unwillingly sustained by personal service or pecuniary contributions. The dislike appears in various laws, calculated to restrain his ambition and somewhat arbitrary government, extorted from Mathias by different diets. Yet we have the following description of the magnificence he displayed at an interview with Wladislaus.

“The princes had a meeting at Olmütz, when Mathias exhibited oriental pomp. For a whole fortnight tournaments, comedies, and balls succeeded each other. In the square a pyramid was erected, by way of buffet, thick-set, from the ground to the summit, with drinking vessels of gold and silver. Upon ten tables placed round it the banquet was spread; but not a cup was removed from the pyramid for the use of the guests, such was the profusion of the king's service of gold and silver. Mathias had royally furnished the lodgings of the Bohemian nobles, and especially that of Wladislaus, the walls of which were covered with hangings of silk and gold. When the princes separated, Mathias bestowed gifts upon all the Bohemian grandes, and presented to King Wladislaus the whole furniture of the house in which he had resided.”

In corroboration of the magnificence of Mathias, we give the following extract from a letter written by the legate, Bishop Castelli, to Pope Pius II., and which is part of the Papal Correspondence touching Hungary, inserted by Count Mailáth in his third volume.

“I had imagined that this king must be impoverished by the long war, as was suggested to me at Gratz; and in enumerating the causes which should induce peace, this was not the last I mentioned; hence, I conceive, a friend of mine invited me, on the 20th, to inspect the palace; than which, with the good leave of Italy, I must say, she possesses not a finer or a larger. Introduced into the wardrobe, I saw so many costly garments, loaded with gold, jewels, and pearls; such tapestry hangings; so many gold and silver vessels wrought with exquisite skill, that I deem fifty men* could not carry them. Amongst other things I saw steps, (qy. stove, in Latin *stufam*, in German *stufe*,) of pure silver, of such height and size that two persons can scarcely embrace them; also two unicorns, the one like a common horse, the other like an ass, with their real horns;

* This correspondence is in Latin, and the word is *maribus*, which a Hungarian writer conceives to be a mistake for *navibus*.

further, admirable crucifixes and altar ornaments, upwards of 590 large dishes, 300 golden goblets, and trenchers and basins without number, all which cannot in truth be justly estimated. Such precious household stuff, such precious plate, such an adorned hall have I seen of this king's, that I believe the glory of Solomon could not be greater."

This, perhaps, is the place for mentioning, that to Mathias Corvinus we are said to owe the invention of posting in carriages, and, indeed, of carriages themselves; coaches deriving their very name from Hungary—for Count Mailáth says:—

"Tomori made use of the posting established by Mathias Corvinus, and journeyed in one of the light carriages, called *Kocsi* by the Hungarians, to the king at Visegrad."

And in a note he appends to this the following explanation:

"The light Hungarian carriages, drawn by three horses, changed horses every four or six miles, [German miles of course, each equal to upwards of four English miles.] * * * The carriages derived their name from the town Kocs; either because invented there, or because the Kocs peasants were the best drivers. * * * Lithius, in his notes on Bonfin, calls Mathias Corvinus the inventor of these carriages. And even if he did not invent the carriage himself, the arrangement for changing carriage and horses may, with all likelihood, be attributed to him."

But however the Hungarians might object to the belligerent propensities of Mathias, or to his occasional assumption of arbitrary power, he was, during his life, and remained after death, their darling and their pride. The fond admiration still attached to his name may have been enhanced by the disasters that followed his death, from Turkish conquest, civil wars, and final loss of independence; but that it does not spring from such causes, that it existed amongst his contemporaries, is evident from the number of anecdotes, and of pictures by pen and pencil, of their great king, preserved and transmitted to us. To these Mailáth dedicates a whole chapter, from which we shall make ample extracts. He begins with the personal appearance of his hero.

"Mathias was of a middle stature; with hair reddish and curly, eyes black, large, vivacious, and fiery, often suffused as it were with blood; his face was ruddy, his nose straight, his mouth rather wide, his gaze the lion's. Whomsoever he looked full in the face, to him he was favourably disposed; him to whom he gave a side glance, he disliked. He was wide-chested, broad-shouldered; his fingers were long,

and the little one he seldom straightened. The aspect of the man was martial; and when he sat on horseback he seemed larger than usual.

"Four pictures of him have come down to us, all contemporary, all dissimilar. * *

"Mathias was one of the best horsemen of his time, and skilful in all martial exercises. His knowledge was great. Besides his mother-tongue, he was acquainted with the German, Slavonian, Latin, and Bulgarian or Turkish languages. The classics were his favourite study; he was familiar with Frontinus and Vegetius, and on retiring to rest he read Livy or Quintus Curtius, to whom he was very partial, or some other classic, after he was in bed. He likewise read the Holy Scriptures very diligently, and astonished those about him with the number of texts he quoted by heart. He was addicted to astrology, and not unversed in other sciences, although he bestowed no especial study upon them. He owed this to his constant intercourse with the learned men of his court, and to his natural quickness.

"To business he most sedulously attended. He read every letter immediately; the answers he generally directed his private secretary to write, and read them over; but frequently he dictated or wrote them himself. His autograph style was most laconic; of which two specimens may suffice. Upon occasion of a dispute respecting the nomination to a prebend, he wrote to the Pope: 'Your Holiness may be assured that the Hungarian nation will rather convert the double cross that is the ensign of our realm into a triple cross, than suffer the benefices and prelacies belonging of right to the crown, to be conferred by the apostolic see.' A letter in his own hand to the men of Buda runs thus:—'Mathias, by God's Grace, King of Hungary. Good-morrow, citizens. If you do not all come to the King, you lose your heads. Buda. The King.'

"With the troops he lived as with his equals. He knew every common soldier by name. He visited the sick in their tents, and himself administered their medicines; the desponding he encouraged; in battle he often bound up wounds with his own hand. Accordingly the army was devoted to him, even unto death. The troops often fought without pay.

"In the first year of his reign he lived like the old Magyar kings. The palace was negligently, or not at all guarded. Many tables were daily laid, at which he eat in friendship and sociability with the great men of his kingdom. The doors were open during the repast; beggars and collectors entered freely, and every one, even the poorest, might speak to the king. Subsequently, when he had married Beatrice, he was more reserved. The court was regulated after the Italian fashion, and the residence adorned with all the luxury of the age. Door-keepers were appointed,

the king was no longer accessible ; only at stated times did he appear, and administer justice."

* * * * *

"In one of his Turkish campaigns he visited the enemy's camp, with a single companion, both disguised as peasants. All day long Mathias sold eatables before the tent of the Turkish general. In the evening he returned in safety. Next morning he wrote to the Turk that he had himself explored his camp, and to authenticate his statement named the dishes that had been served up to the Ottoman. The Moslem was scared and fled.

"At the siege of Shabacz he disguised himself as a common soldier, got into a small boat with a single attendant and a rower, and was rowed along the fortress, in quest of the best place to assault. The Turks fired upon them ; the attendant was killed, but the king, without a symptom of alarm, continued his exploration of the walls."

We here adduce another anecdote relative to the same subject, which our author has separated from it. In fact he seems to have written his anecdotes as he happened to light upon them, without the slightest regard to order or classification.

"During the siege of Vienna the king entered the town in disguise, and after strolling about sat a long time, as though to rest. Suddenly it was rumoured that Mathias was within the walls, and he was every where sought. The report reached him ; without discovering any alarm, he took a wheel in which was a broken spoke, and rolling it before him, walked along the street, passed out of the gate, and returned to his camp. When Vienna was taken, the Hungarians, in commemoration of his disguise, danger, and escape, caused his image to be carved in stone, and set it up in the place where he had so long sat and rested."

The following anecdotes of his mode of giving audience evince great adroitness in baffling arrogance, and extraordinary readiness and powers of mind.

"A Turkish ambassador boasted that he had by his eloquence swayed at his pleasure every prince to whom he had been sent, and that even so would he manage King Mathias. Mathias was informed of the vaunt, and ordered Neustadt, which he was then besieging, to be stormed upon the day appointed for the Turk's audience. He led him to the scene of action, received his communications amidst a shower of balls and arrows ; answered upon the instant, and dismissed him. The envoy was so amazed and bewildered that he entirely forgot the king's answer. In vain did he beseech its repetition ; Mathias gave him

a letter to Bajazet, in which he requested the sultan to send him in future men who were capable of noting a message.

"At Vissegrad he once received a Turkish envoy in full regal state : and looked at him so formidably that the diplomatist altogether forgot his errand, and could say nothing more than, 'The Emperor greets ;' 'The Emperor greets.' Thereupon the king turned to his court and said, 'See what beasts are suffered, by our own fault, to ravage our lands and those of other princes !' Then followed the proclamation of a Turkish war, and the Moslem was sent home."

* * * * *

"Envoys from the King of Poland presented themselves at Vissegrad, and made a speech in the Polish tongue that lasted full two hours. When it was ended Mathias inquired whether they wished the answer to be in Polish or in Latin ? The envoys referred that to the king's pleasure. Then did the king recapitulate all that the envoys had said during these two hours, improved the arrangement of their matter, and refuted it point by point, to the astonishment of the envoys and of all present."

Of this monarch's love of justice, we are told ;

"The king's justice was so generally known as to have become proverbial. The Magyar says even to the present day, 'Mathias is dead and justice is lost.'"

* * * * *

"When the war broke out between Hungary and Austria, a brave officer accosted Mathias with a request for leave to join the Emperor Frederic, to whom he had pledged himself by oath to return in case of war, be he where he might. The king dismissed him with rich presents, and extolled him highly for having preferred his oath to his own interest and a king's favour."

* * * * *

"It was reported to the king that some of his court designed to poison him. The accusation did not seem improbable ; but Mathias replied : 'He who governs justly has neither poison nor dagger to fear ; and what is most probable is not always true.'"

As Mathias was deemed by his subjects and himself so just a king, he may have fancied, however erroneously, the right to be on his side in his attempt to wrest Bohemia from his father-in-law. The following however shows somewhat whimsically that his notions of right and wrong were derived strictly from precedent.

"During the Bohemian war, a person accosted Mathias Corvinus, and undertook to slay King George by the sword, in consideration of a reward of 5000 ducats. Mathias promised him the reward, but the man presently saw that the thing was im-

practicable. He returned to Mathias, confessed that he found it impossible to kill King Podiebrad by the sword, but offered to poison him. Mathias forbade him, saying: 'The Roman Fabricius warned his enemy Pyrrhus against poison.' And he forthwith sent to admonish King George to have his food tasted, as he was in danger of being poisoned."

The next anecdote shall be our last, and should perhaps have followed the account of the king's skill in martial exercises, but comes not amiss as the close.

"There came to Buda a stout combatant, named Holubar, of marvellous size and strength, who was reputed invincible in tournament. The king, excited by his fame, challenged him. Holubar declined the proposed tilting match; but Mathias defied him a second time. Holubar then accepted the challenge, resolving to yield to the king's least blow, and let himself be unhorsed. This was reported to Mathias, who compelled Holubar to take an oath that he would fight with him (the king) as with his worst enemy. * * * Many thousand men witnessed the tournament. The two combatants ran at each other; Holubar, struck on the head and borne backwards off his horse, lay swooning on the ground, with a broken arm. The king, struck on the breast by his antagonist's spear, fell sideways out of the saddle, but held himself on by the horse's mane. Mathias caused Holubar to be well leeches, and upon his recovery bestowed rich garments and much money upon him."

We must now turn to the close of this extraordinary man's life. He had no legitimate children, and tried hard to induce the Estates of the kingdom to choose his natural son, John Corvinus, for a successor. In this he failed, partly by the opposition of Queen Beatrice, who seems, however, to have been instigated either by a step-mother's feelings or by a hope of marrying the next king, and not by conjugal jealousy; for John Corvinus, now of man's estate, must have been born prior to her marriage. In the midst of his exertions for this object, and in the vigour of manhood, death overtook Mathias.

"It was on Palm Sunday that he returned from church fatigued; he ordered dinner to wait for the queen, but asked for some figs. Bad ones, that he could not eat, were brought him, and he was exceedingly angered. The queen now came in; soothed him, and offered him various viands; but he refused all, complained of dizziness and a cloud before his eyes, and was led to his room, where he was struck with apoplexy." John Corvinus, the Bishop of Erlau, and all the grandes poured in; and it was

a sad sight to behold the king, tortured with pain, and unable to speak, whilst only the *jaj! jaj!* (oh! oh!) of suffering, or the sacred name of Jesus, passed his lips. The queen alone retained presence of mind; she encouraged the physicians, forcibly opened his firmly-compressed lips, and administered medicine; she opened his half-closed eyes; she left nothing unattempted to recall him to life. His pains nevertheless increased; he sometimes roared like a lion; his greatest grief was that he could not speak. He looked now at the queen, now at his son; he was evidently struggling for words. The queen tried to guess his thoughts, and asked did he mean this or that? In vain! He could neither assent nor deny. So passed this day and the next. His sufferings then relaxed, but he remained dumb. In the morning of the third day, it was conjectured from his gestures that he was appealing to the mercy of God; and before eight o'clock, Mathias was dead." [He was not fifty years of age.]

* * * * *

"I cannot possibly quit the history of the great king, without quoting the judgment of an able and experienced man, namely, the Apostolic Legate Castelli. He writes to the Pope: 'The king is learned, he speaks with earnestness and majesty, saying nothing but what seems to him worthy of belief. When I consider his talent, eloquence, morals, art, and valour, I find that he surpasses all the princes I know, without a single exception. Most Holy Father! This king is of an unwearied spirit; he is wholly martial, thinks but of war, and carries it on without many words.'"

The sun of Hungary set with Mathias Corvinus; and the remainder of the history of the Magyars is saddening. Yet its gloom is occasionally relieved by some gleams of intellect and heroism. Of the powerful Jesuit we have already spoken, and we cannot take our final leave of the subject without bringing before the reader one of those invincibly resolute defences of besieged towns, to which we have heretofore alluded.

"When the Sultan appeared before Szigeth, A.D. 1566, he saw the walls hung with red cloth, as though for a fêstal reception, and a single great cannon thundered once, to greet the mighty warrior monarch. Zrinyi assembled his troops, swore in their presence to hold out to the last drop of his blood, and required a similar oath from them. He then issued severe orders; whoever disobeys his commanders; whoever receives or reads a Turkish letter; whoever finds a letter shot into the town with an arrow, or otherwise introduced, and brings it not instantly to his commander to be burnt; whoever deserts his post; whoever speaks secretly with another; whoever sees such things and declares them not;

whoever steals a single farthing, shall be forthwith executed. The gates were blocked up; the gardens and hedges that might have sheltered the Janizaries, burnt.

"The Turks assaulted the new town on three sides; they pressed on so powerfully the whole day long, they continued the attack so hotly through the night, that Zrinyi despaired of its defence, and next morning set fire to the new town. The Janizaries occupied the smouldering ruins, and thence fired upon the Christians in the old town."

We pass over several repulsed storms, as too long to detail.

"Not content with the force of arms, the Turks likewise tried craft and seduction. German, Croatian, and Hungarian writings were shot into the town with arrows; they were so many exhortations to the troops to surrender upon honourable terms instead of uselessly resisting. To Nicklas Zrinyi himself the Sultan promised the whole of Croatia. The hero had a harder trial to surmount, when he saw his son's banner wave in the Turkish camp, heard his son's trumpeter wind the well-known war-song in the Ottoman army. Zrinyi was to be led to believe that his son was prisoner to the Moslem, in order to be induced to redeem him with the fortress. The fact however was otherwise,—young Zrinyi was in the emperor's camp; only his standard-bearer and trumpeter had fallen into the hands of the Turks.

"Vainly did Zrinyi gaze around; no relieving army appeared, and he knew but too well that a fortress must fall if not relieved. The Turks stormed and were repulsed; the ex-pacha of Egypt was slain, and two standards of the misbelievers fell into Zrinyi's hands. Three days after, the assault was more vehemently renewed; the anniversary of the battle of Mohacs, of the capture of Buda and Belgrade, was to be glorified by the fall of Szigeth: but the efforts of the Osmanli were unavailing. A few days later the Turks stormed more decisively. During the fight they managed to set fire to the houses in the fortress. Though pressed from without by the Ottoman arms, from within by the conflagration, Zrinyi battled still. Twice did the Turks break in, twice were they driven out; at length the flames approached the powder magazine; the Turks had struggled in on the opposite side, and Zrinyi retreated perforce into the inner castle. From its walls the waves of Ottoman war again recoiled. Solyman, peevish and impatient, wrote with his own hand to the grand vizier: 'Is not this chimney yet burnt out, and sound not yet the cymbals of conquest?' He lived not to joy in the fall of Szigeth, but died that night of dysentery, apoplexy, or old age.

"The grand vizier, Mehmed Szokoli, concealed the padishah's death, and zealously prosecuted the siege. Three days Zrinyi

held out in the inner castle; provisions he had none; women and children were perishing of hunger and thirst; the Turks flung in fire, and the roofs were in flames; the death-hour had struck. Zrinyi ordered his chamberlain Thawz Serenk, to adorn him as for a festival: he concealed the key of the fortress in his garment, with an adjunct of 100 Hungarian ducats, 'In order,' he said, 'that he who strips me may not complain of want of booty! From four sabres he chose that which his father had wielded, with which he himself had in youth ridden into his first battle. Thus he appeared amongst his men, who awaited him crowded together in the courtyard. He exhorted them to think of God and their country, took a single shield from his chamberlain, and ordered the gate to be thrown open. The Turks were rushing on, he fired a great mortar that lay under the gate, and the foremost rank fell. With the battle-cry of *Jesus!* Zrinyi rushed out; his standard-bearer, Juranich, waved his banner before him, his men stormed after him. Two balls in his breast and an arrow in his head laid him low. With the exultation of victory the Janizaries shouted *Allah!* lifted him up, bore him above their heads to their aga, laid him, face downwards, on Kabzianer's cannon, and struck off his head.

"Death, flames, and confusion held divided sway in the conquered castle; the Janizaries slaughtered women and children when they could not at once agree as to their allotment. Zrinyi's chamberlain, treasurer, and cup-bearer, were taken alive; their beards were shorn and burnt in scorn, and they were dragged before the grand vizier. He asked for Zrinyi's treasures. Then did the cup-bearer, a nobly-born, proud-spirited youth, reply; '100,000 Hungarian ducats, 100,000 dollars, 1000 goblets and other vessels has Zrinyi consumed; what remains, scarcely 5000 ducats, lies in a chest. But of powder he has plenty, and soon will it explode; that fire, without which you had never taken the castle, will destroy you.' The Tshaush Bashi rode hastily off with his Tshaushes to prevent mischief; but ere he arrived, the town blew up with a thundering crash, and 3,000 Turks were blown up in it, or buried under its ruins."

With this extract we take our leave of Count Mailáth and the Magyars; yet, we would fain trust, not a final leave, as we cannot but think that his collection of Magyar legends, which we have not yet met with, must contain original and highly interesting matter, and that the mine he has undertaken to work cannot yet be exhausted.

With respect to the volumes now before us, that we consider them a very valuable contribution to the historic stores of the age, is evident from all we have said, and we should hope from what we have shown; but we cannot profess to esteem the

History of the Magyars quite so highly as our German brethren. Considered as a composition it is not the production of a master-hand. The matter has assuredly been collected with great, laudable, and not easy diligence; but to omit minor defects of arrangement, blunders in names and genealogies, &c., already mentioned, there is great want of method in the conduct of the narrative. When the affairs of different countries or the different affairs of the same country, as religious and military, foreign and civil, wars, or the like, have to be carried on simultaneously, the author does not so order them, so keep them abreast, as to enable the reader to feel and appreciate as he proceeds their action and reaction upon each other. A difficult art certainly, but the historian's proper and especial business. With respect to the occasional inaccuracies in language and composition, and the awkward repetitions, all of which have now and then cost us no small trouble in translating, we apprehend that they may in great measure be excused upon the plea alleged by Count Mailáth for the numerous typographical errors; to wit; that his failing sight obliges him to trust, wherever it is possible, to the eyes of others. The work, however, in spite of these defects, is a great acquisition to literature and history.

ALTHOUGH few persons will agree with the eloquent and enthusiastic German reviewer* who claims for his countrymen the glory of *alone* leading the world in all future improvements, none will deny them the honour of having heretofore done a vast amount of good in this shape to mankind; and they undoubtedly stand at present among the very foremost of those Christian communities which are pressing forward the most energetically to advance general civilisation.

"Two great powers," says the writer alluded to, "are in conflict; that which seeks to preserve all existing things, and that which would change them for some supposed better condition. The Germans *alone* of all mankind are capable of bringing this conflict to a good issue. Italians, French, and English have proved themselves incapable of that thorough regeneration of the heart which is indispensable for realizing the destiny of man. It is to Germany that the world must look for those who by individual character and by the favour of circumstances will purify it. The free German of antiquity destroyed the despotism of Rome; the German league of the Rhine, and the Hanse Towns, created the powerful marine of the middle ages, and then established civilisation and freedom in all parts of the north and west of Europe: German genius produced the printing-press; and the German Luther, with his train of intellectual followers, destroying Roman Domination a second time, show our influence."

An Address to the Königsberg German Society at the Anniversary of the Coronation of the King of Prussia, 18 January, 1835; with Notes, by

* Dr. F. Tiedemann.

"The principles which now animate the whole German nation are peculiar. They have no one point in common with the equality which the French have boasted of since 1789. They are the doctrines which alone can elevate the whole human race, and Germany *alone* is thoroughly imbued with them.*" It is not very clearly shown by this writer what these all-important doctrines are, and his pretensions, which are not new, have been disposed of by at least as able a *German* pen as his own, and in terms upon which those who share his opinion will do well to ponder.

"The historian of mankind," says Herder, "must take care that he chooses no tribe exclusively as his favourite, nor exalts it at the expense of others, whose situation and circumstances denied them fame and fortune. The Germans have derived information even from the Slavians: the Cimbri and Lettonians might probably have become Greeks, had they been differently seated with respect to surrounding nations. We may rejoice that people of such a strong, handsome, and noble form, of such chaste manners, so much generosity and probity as the Germans, possessed the Roman world, instead perhaps of Huns or Bulgarians; but on this account to esteem them God's chosen people in Europe, to whom the world belongs in right of their innate nobility, and to whom other nations are destined to be subservient in consequence of this pre-eminence, would be to display the base pride of a barbarian. The barbarian domineers over those whom he has vanquished; the enlightened conqueror civilizes those whom he subdues.†"

But without being troubled by patriotic exaggeration it will readily be admitted that the circumstances of the German people for some centuries past have been singularly propitious to the steady progress of civilisation, and that these circumstances have greatly aided the natural advantages which favour the regions between the Baltic and France. The territorial riches of the Germans; their various resources in trade; their learning; their ancient free spirit, which, in spite of general political enslavement, has produced many ameliorations in their laws; and their unchanging military prowess, requiring only a better direction to restore political freedom;—all these things give them enough influence in the world to justify a high degree of national self-respect.

But what the Germans have accomplished in one most important branch of human relations is both remarkable in extent and peculiar in variety and character. This branch relates to "THE INTERCOURSE BETWEEN THE MORE AND THE LESS CIVILIZED RACES," between powerful Christian nations, and the comparatively feeble natives of the New World, of Africa, Asia, and the South Seas. This intercourse, as is well-known, has hitherto been fatal to the weaker and less civilized parties. But the generally destructive character which it bore during many centuries, has of late been considerably modified through good men's efforts, largely, although indirectly, shared by the Germans.

Of these efforts the obvious examples are, the attempts to abolish the slave-trade from Africa to America; the more humane treatment of slaves; and the partial abolition of negro slavery; yet these are only the commencements of humane enterprizes, calculated to change the condition of all the remotest regions of the earth.

It will not be attempted here to follow out completely any of the operations of the German mind, which have promoted these results, for the vastness of that inquiry far exceeds our limits; but the sketch proposed to be made of these operations will open a subject less studied than its importance deserves. The missionaries of that country, such as the Moravian brethren; its philosophical writers, such as Herder, Schiller, and Schlegel; its linguists, travellers and geographers, the Forsters, Adelungs, Chamisso, and Von Humboldts, have altogether produced materials which throw a clear light upon the subject: and it will not be difficult to infer from these some distinct views of what has long been contemplated by eminent Germans, and to conclude how far their objects have been realized. The utility of such an inquiry is obvious. Vices common to all Europe, and false opinions, prevalent among the most civilized people, contribute to the ruin of the coloured races; and to rescue them it is indispensable to improve both the conduct and the sentiments of enlightened Christians generally on the whole subject, in order that the oppressed may have some chance of protection; that the ignorant may be adequately instructed; and the debased elevated every where.

The grand characteristic of Germany on this head is, that a national colonial interest does not exist there to bias the national judgment, and harden the popular feelings in regard to uncivilized tribes. The German consequently has during three centuries looked impartially upon the relations between those tribes on one side and colonists and the

* Braga. Heidelberg. 1838, pp. 295 and 311.

† Herder's Philosophy of History, (English translation) 2d vol. p. 361. 2d edition. 8vo. London. 1803.

maritime government on the other. The union of Spain and its American dominions with the German empire in the person of Charles V., created a brief exception to this exclusion from colonial power and prejudice. Two hundred years afterwards, a vigorous attempt was made by another Emperor of Germany, Charles VI., to obtain a share of the Indian trade; but without success. This was in the beginning of the last century, when the Ostend Company was formed under favourable auspices, but was finally ruined through the jealousy of the Dutch and English. The Prussians have subsequently met with less formidable difficulties in the same quarter; and since the general peace of 1815, as many as 20,000 Germans emigrate yearly to America and other new countries to the west, and a large number to Russia; but in no part of the world have they yet formed colonial settlements of their own;—a fact which is particularly worth attention at this moment when three other great nations, the Russians, the people of the United States of North America, and the English, are literally bringing the ends of the earth together, and covering large portions of the uncivilized world with new settlements, beyond all example extensive and rapidly formed; and when France and Portugal are struggling to pursue the same career in Northern, Western and Eastern Africa. It is well in this state of things that one great civilized people should stand apart; and exercise a calm, disinterested, and enlightened judgment upon the way in which other nations use their power and prosperity.

The history of the German race has indeed been very remarkable in regard to the nature of its migratory intercourse with other nations. That intercourse for a long time varied but little from the common career of a powerful people; it was characterised by unscrupulous conquests, and not unfrequently by a merciless extermination of the conquered, such, for example, as took place in at least a large portion of Britain after the first Saxon invasion; and presents but few claims to the love or respect of mankind. Rovers by sea and land, the Germans were long characterised by several of the bad as well as good qualities which spring from a precarious course of life. A brief record preserved by Procopius of the Erulians aptly illustrates their early history. This tribe, which inhabited a country north of the Danube, were highly superstitious, and addicted to human sacrifices: they even required wives to put themselves to death at the graves of their husbands. They were powerful, and prone to war; savage, and incen-

santly occupied in making predatory incursions upon their neighbours. At length they were completely defeated by the Lombards; whom they had grievously oppressed, and foully insulted. Meeting with deserved chastisement from this kindred tribe, the Erulians migrated, and were kindly received by the Roman emperor Anastasius, until their insolence again brought down a severe vengeance. Under Justinian they preserved their old perverse character as a people, but were incorporated with the provincial Romans in the north of Italy. A portion of this tribe, however, emigrated to a far more remote land;—the real Thule perhaps of the ancients—a country lying beyond the ocean, west of Denmark, of ten times the extent of Britain, and where the sun did not set for forty days in summer, and in winter was entirely lost for many weeks. This country, the Greenland of our days, was then peopled by numerous tribes, of whom the Scrithifins, or Esquimaux, fed on little but animals, and were clothed in skins.

The Erulians were received in Thule with great cordiality; obtained lands: and became sufficiently flourishing to furnish their people who took refuge in Italy, with a king from the royal stock which accompanied the Transatlantic emigration.*

It deserves a passing notice, that, three or four centuries later, the same parts of the world were visited by the North-men, accompanied, it is recorded, by Germans who recognized the grape of America from its resemblance to the fruit of their own vine. On this occasion the conduct of the voyagers to the Scrithifins, who appear still to have existed, was not such as to ensure them a warm welcome in the new country†.

But we hasten to less apocryphal times. The discovery of America found the Germans of the 15th century perfectly capable of appreciating all the wonders, present and probable, of that great event. If they were not yet nationally interested in the financial results of this opening of supposed new routes to the rich countries of the East, or in those of the real benefits Europe was to derive from the West, still no people devoted more intense, or more continued attention to all that was daily related and written concerning the latter land. At this period Germany itself was the fairest country in Europe, no extensive part of even Italy excepted, and supplied, almost alone, all other lands with the finer products of its industry. The gold

* Procopius, de Bello Gothico, lib. ii., cap. xiv and xv.

† Antiquitates Americanæ Ante-Columbæ, Hafniæ. 4to. 1837; and see also Foreign Quarterly Review, No. XLI.

and raw productions of other countries flowed thither to reward that industry. The splendour of its public buildings was only equalled by the refined adornment of private habitations. If the Germans did not keep up with the Spaniards and Portuguese in their progress over the ocean to the West and South, they were remarkable for the ability with which they studied all the important branches of knowledge connected with the extension of geographical science, and with the spread of civilisation into remote regions. It was a native of Franconia, John Muller (Regiomontanus), whose astronomical Ephemerides, published at Nuremberg in the fifteenth century, were used on the coasts of Africa, America, and India by Diaz, Columbus, Vesputius, and Gama; and it is justly said by the writer whom we are following, and who in this particular department of science has himself done so much for the honour of his country, that the names of Regiomontanus, and Martin Behem, a native of Nuremberg and the friend of Columbus, alone give to Germany a large share in the glory of discovering the new world; and that the geographical renown of the latter has even suggested, for America, the German name of Western Bohemia.*

It is probable, indeed, that more books on all topics concerning African and American discovery were during the half centuries before and after the voyages of Gama and Columbus, published in Germany than in any other country; and Von Humboldt again justly notices the extent to which the earlier writers carried their speculations upon the nature of the newly-found tribes of men, almost anticipating the philosophical inquiries of later times.

But these speculations produced no beneficial effect upon any of the practical men who then went to the new world to get gold, and who were all utterly regardless at what cost of blood and tears to the natives it was obtained. Germany in the sixteenth century must be included within the strict terms of this condemnation. The Emperor Charles the Fifth gave a province in America to the great merchants of Augsburg, the Welzers, who had lent him large sums of money. This cession led to the occupation of Venezuela by Germans for above twenty-six years. Some of them wrote full accounts of the country at that period, and their books were published in the original language soon afterwards. They have been lately repub-

lished in French in the collection of M. Henri Ternaux; and more impartial testimonies could not be desired to show how little German DOMINATION in the new world differed from that of Spain, or England, or Portugal.

One of those works, the narrative of Nicolas Federmann, appeared originally in print at Haguenau in 1557. The author commanded a party of Spanish soldiers and German miners sent in 1529 to Venezuela: and his first intercourse with the natives does not place him in a favourable point of view. He very calmly, and quite as a thing of course, set about seizing the natives for interpreters and guides; and exhibits the recklessness of the practice by taking prisoner a poor woman who complained of the injustice of their conduct, as she and all her tribe were the Christians' friends. He also mentions without a word of reprobation the marauding expedition of another German commander during eight months in the interior, where one hundred of the men were either killed in attacking the natives, or died of diseases. These disasters did not daunt Federmann, who, in his turn, set out in September, 1530, upon an expedition that might procure him some "advantage." The party consisted of one hundred and ten armed footmen and sixteen cavalry, with one hundred friendly Indians. They were absent six months, making a circuitous route through an unknown country towards the Pacific, which they reached at Xaragua. The remotest point of their route was at seventy miles distance from Coro, the place of departure. The objects of the expedition were, to collect gold by any means; to subjugate the natives to the emperor and to his grantees, the bankers of Augsburg: and to convert them to Christianity by force if persuasion should fail. All these objects Federmann pursued with a spirit of perseverance worthy of a better cause, and quite regardless of the claims of humanity.

He encountered twenty-two tribes upon this expedition; eleven were friendly, and eleven hostile.

With the former, amicable communications were held by means of interpreters, before the arrival of the whites at the villages of the Indians. In the latter, the Indians were never approached with caution or consideration, and were often attacked by surprise. This uniform correspondence of various results with the various character of the proceedings of the party, speaks powerfully in favour of the more humane system of conciliating the friendship of strange and uncivilized tribes by at least the simple step of opening communications with them through competent interpreters. The following sum-

* *Examen critique et historique de la Geographie du Nouveau Continent.* Par Alexandre de Humboldt. Paris. 8vo. 1836: vol. i. p. 274.

mary account of a part of the occurrences will be found highly characteristic ; and leaves no doubt of the fact, that German authorities in the sixteenth century in America differed little from those of other Christians, in regard to the rights of the Indians.

After describing several sanguinary conflicts, which he attributes to their *treachery*, Federmann states, that he caused two of the chiefs who had accompanied him willingly, to be seized and tortured, in order to compel them to confess why they had assembled their people in arms, and why they had ill-treated a party whom he had left behind, refusing them provisions, which it was his practice to demand *without payment*. They bore the pain without acknowledging their offence ; and one was then shot in cold blood “for an example.” Federmann adds that the promise of life induced the other to confess that an attack upon the Christians had been concerted. Thereupon he amused the followers of these chiefs, above eight hundred in number, with *friendly discourse*, and taking his measures properly, put five hundred of them to death by surprise ; the cavalry of the Christians easily dispersing this body, the infantry “stabbing them like pigs.”

Upon another occasion his people, assisting one tribe against another, destroyed great numbers of the enemy and made 600 prisoners, of whom he kept the able-bodied for his own use, but gave the wounded, the children, and old men, as slaves to the chiefs of his Indian allies.

The close of the expedition was signalized by acts of extreme barbarity :—

“We now reached the Caquaties,” says Federmann, “and took our usual course. Reaching a village at an early hour, when they take breakfast, we surprised them so completely that, not being able to escape, they barricaded their houses. Hereupon I signified to them that their alarm was needless, but that if they would not open their doors I would burn down their town. They then communicated with us, apparently in a friendly manner. But it being soon perceived that the women and children were gradually withdrawing from the place, a step that usually precedes hostilities, I told their cacique that the strange Indians *he saw with us in irons* were thus punished for endeavouring to betray us ; and that if he persevered in his treachery, the same fate awaited him. Alarmed for his personal safety he attempted to escape, and when my men laid hold of him he uttered loud and piercing cries to his people for aid. To prevent a tumult I ordered a soldier to stab him. We then set upon the Indians, and, after killing many of them, came back to the chief’s house, where we had deposited all the gold collected in our expedition. Here twelve Indians had con-

cealed themselves in a corn-loft ; having killed eleven of them after a desperate conflict, I caused the survivor to be tied to a post, and to be left in that condition when we departed, in order that he might tell his countrymen when they should come in of the vengeance all might expect who should deal treacherously with us. We took some of the people of this village in irons as our guides ; and on discovering that they were misleading us, we tortured some, but they persisted in their story. I then ordered two of them to be cut in pieces to terrify the rest ; in which object we failed, for they preferred death to being in our service, and hoped to have destroyed us by conducting us throughout a country without provisions, and without water ; this plan almost succeeded.”—p. 190.

These atrocious acts seem to have excited no attention at the return of the party to the capital of the new colony ; and the commander of the expedition proceeded to Europe, undisturbed either by the Imperial prosecutor’s investigations or by the stings of conscience.

The cool way in which Federmann pursued his vocation of religious missionary, shows that he was in no very imminent danger from the latter. “One day,” says he, “receiving a friendly chief and sixty of his tribe, I caused them all to be baptised, and I explained the Christian doctrines to them as well as I could, which, it will easily be credited, was poorly enough. This preaching is indeed a senseless affair, for it is through compulsion only that their profession of our faith is obtained.”

Certainly the clerical aid furnished for the expedition indicates that force, not persuasion, was depended upon for making converts. The religious teacher, a monk, partook more of the character of Friar Tuck than of Las Casas, or Xavier. Upon the only occasion on which he is personally mentioned by Federmann, he saves some of the soldiers from a huge panther at the risk of his own life, by bravely closing with the furious animal, and stabbing it with his halberd.

After a few years, upon the separation of the empire from Spain in the persons of the successors of Charles the Fifth, Germany ceased to have a national interest in America ; and whilst the maritime powers of Europe,—Spain, Portugal, Denmark, France, Sweden, England, and Holland, gradually acquired possession of half the new world, Germany shared their acquisitions only through private adventurers ; either by occasional drafts of soldiers hired to fight particular battles ; or by a few emigrants, such as from time to time have sought a refuge from religious persecution at home ; or,

finally and indirectly, by the attention which learned men have given to the progress of discovery.

The lead taken by Germany towards the end of the sixteenth century in Geographical studies, independent of any colonial interest, is proved by the encouragement given to these studies there, when it has been refused elsewhere. The works of this class published by our Hakluyt in that period, bear a deservedly high reputation; they unquestionably tended greatly to the founding of our old North American Colonies. But the works of Levinus Hulsius, a refugee, far surpass them, not only in extent but in character. Mr. Asher of Berlin, whose interesting Essay on the Collection of Voyages and Travels, edited and published by him and his successors, ought to have a more extensive circulation than *sixty* copies can give it, is doing a public service by his enlightened labours on the subject. In pursuing those labours we hope he will not forget De Bry's early works of the same class, to which Herder attaches the credit of having supplied almost the only drawings of objects found in new countries, used by speculative writers from the 16th to the 18th centuries.

The difference of national position clearly created a difference of principle in the national mind; and accordingly, it was from Germany that *first* proceeded opposition to the enormous wrongs which coloured men have so long suffered from Christian colonists. Upon this point the testimony of the ablest writer on the general history of the United States of North America is positive, although even short of the whole truth. "On the subject of negro slavery, the German mind," says Mr. Bancroft, the historian alluded to, "was least enthralled by prejudice, because Germany had never yet participated in the slave trade. The little *handful* of German Friends from the highlands above the Rhine, resolved that it was not lawful for Christians to buy or to keep negro slaves. This occurred when the general meeting of the English Quakers hesitated to make the only just decision on the question!"*

The same freedom from contaminating interests prevails still in Germany; and unless we greatly err, it has long been working a degree of purity in public opinion there on these questions concerning the coloured races, that has produced very remarkable results in the public mind. A rapid survey of more recent facts that seem to justify this observation, will fully explain our meaning,

and show clearly in what manner those countries which are less favourably circumstanced, may best and most directly turn this German purity towards the correction of their own errors. To this end it will be found, that large contributions may be obtained from the researches of science as well as through religious conviction,—and that the philosophy of German professors may be consulted with advantage by the statesmen of every land, upon most of the great questions which concern mankind at large. It is extremely probable that the condemnation of negro slavery, for example, by those professors, preceded its discussion in England; and no where has British negro emancipation been hailed more cordially than by German writers.

They who claim for Germany the very highest pinnacle of glory, to the exclusion of other nations, are so far at least in the right, that there has been in that country more than elsewhere a continued pursuit of objects tending to the general good of mankind. Although the German language may have been but recently polished, studies and principles, which are prevalent in that country at the present day, were in high estimation there in times far removed; and the catalogue of illustrious names, to be selected as those of the men who long represented the genius of the land, will spread not very unequally over the whole of the last four centuries. The age that produced Luther is rightly asserted to have been the true parent of that cheering spirit which the people at large are now beginning to share. Thence besides those who have already been mentioned, and many more who need not be named, came Ulrich von Hutten, Melancthon, Keppler, Leibnitz, Zinzendorf, Haller, Wolff, Moser, Iselin, Lessing, Kant, and Fichte; nor need we prolong the list by the addition of those who have not yet ceased to do their country honour.

Principles which most beneficially affect uncivilized nations might be easily deduced from the writings of those great men, and formed into an admirable system; and missionaries, settlers, geographers, physiologists, but in especial, *political* philosophers, have all liberally contributed to this result. The land of Luther was not likely to be backward in Missionary efforts among the heathen; and the interest felt in Germany in favour of those efforts has never been confined to, what may be considered a somewhat interested party—namely, the actual Missionary labourers. But such men also as Herder and Goethe studiously consulted their records, watched their proceedings with vigilance, applauded their success, and frankly noted

* Bancroft's History of the United States, vol. ii., p. 403.

their occasional errors. Those who were sent forth by Count Zinzendorf, originally with a view to visit the whole world, have been pre-eminent from "Greenland's icy mountains" to the pestilential regions of the burning zone. The Moravians, who are in our day almost as much English as German, and to whose example must be attributed much of our English missionary success, although founded at Herrnhut in Lusatia in 1722 only, came from the ancient Bohemian church, known under the same appellation, in the middle of the fifteenth century. "Watered by the blood of its martyrs, John Huss and Jerome of Prague," says its historian, "it spread in numerous flourishing branches through Poland and Moravia."* After many persecutions, and having been once snatched from the brink of ruin by the timely assistance of the Church of England, this body of Christians assumed their present form of discipline; and they have ever since been the steadiest, if not the most important of Protestant Missionaries to the heathen world. Other German churches are at the present moment actively engaged in the same cause. They are swelling the ranks of the spiritual labourers in that most hopeful field of religious cultivation, South Africa: and they have thrown themselves, without counting the risk, into the almost hopeless contest of the savage with the convict in New South Wales.

Whilst they neglect none of the duties of their peculiar calling, they, like worthy followers of the clergy of the Middle Ages, bestow inestimable benefits on the tribes they visit, by carefully teaching the arts of social life, and by curing those diseases "as a work of compassion," which governments ought to endeavour to check by means of adequate establishments.†

In regard to the boundless field of interest opening in China, a German missionary, Gutzlaff, has given perhaps a greater impulse than any other man to the desire and

means of promoting the best sort of intercourse between Europeans and the people of that most important empire; which, together with the regions of Central Asia, other German Missionaries had in view a century ago, when Count Zinzendorf at Herrnhut planned his gigantic scheme of Christianizing the whole heathen world. In British India also, German missionaries are now labouring with eminent success.

As mere *emigrants*, seeking new homes, Germans are met with in almost all quarters of the world, where the civilized nations are abusing their power. But it does not appear that German *colonists* have ever directly made great efforts to stay the evil. Their wide-spreading settlements in North America, where their language is firmly fixed in numerous churches and towns, present no peculiar refuge to the harassed Indian. In South Africa, where they are more dispersed, they have formed no exception to the general rule, when Hottentots, Bosjemin, or Caffres were to be hunted down. In South Australia, where they are now thronging under better auspices for the aborigines, it remains to be seen whether they will take the more humane course, which their own origin, and the kindly dispositions of many colonists, equally recommend.

But it is in Russia that the *indirect* colonization of Germans has produced the greatest effect in the civilisation of barbarous people. The German party in the government of that country is most important, but perhaps the power of their political party is the least of the German good influences existing from the frontiers of Poland to Bhering's Straits.

Although the civilizing influence of Germany was felt in Russia before the reign of Peter the Great, it was that enlightened barbarian who laid the most extensive foundation for the remarkable efforts since made unceasingly by the Russian sovereigns to give their people the direct advantage of German instructors in many branches of knowledge, and of German functionaries in various departments of the government. Peter looked upon the Germans as a far advanced people, because they had already erected some of those arts and manufactures in Moscow; and he and his successors have encouraged the settlement of Germans of all classes in all their dominions with the steadiness that characterises Russian policy. Several rich German merchants have been settled in Petersburg for many generations; they speak Russian for business, but otherwise generally very pure German, and are sufficiently numerous to keep their own society apart.

* The History of Greenland, including an Account of the Mission of the United Brethren in that Country. From the German of David Crantz, vol. i. p. 2. 8vo. London, 1820.

† "The little physical skill of the Middle Ages was in the hands of the clergy, and hence it was a tissue of superstitions: the devil and the cross acted the most conspicuous parts of it. It would have been a truly guardian office, if all Europe had combined against the influx of diseases, as real works of the devil, and left neither small-pox, plague, nor leprosy in the land; but they were permitted to enter, rage, and destroy, till the poison exhausted itself. TO THE CHURCH, HOWEVER, WE ARE INDEBTED FOR THE FEW INSTITUTIONS FORMED TO COUNTERACT THEM; this was done as a work of compassion, which men yet wanted skill to perform as a work of art." Herder's Philosophy of History, vol. 2, p. 524, b. xix, c. iii.

In the Uralian mountains many families are German.

An influential portion of the resident population of Tobolsk are the descendants of German families. Their manners are polished, and most agreeable to strangers; they are chiefly employed in public offices, and thoroughly attached to their new country, having entirely accommodated themselves to the manners of Siberia. But they are in an extraordinary degree devoted to their old religious faith.*

The influence of free German principles and aspirations has indeed reached the wilds of Siberia in several forms. Officers of the greatest merit, who had been enlightened by their fellow soldiers in the German armies in 1813 and 1814, and who had adopted the views of the German Association of Virtue (Tugendbund), attempted to introduce a more liberal government into Russia, by an extensive conspiracy; and for this attempt in 1826-7, many of them were banished to Siberia. Among those Murawiev has acted a conspicuous part. After some years he was appointed to an office of responsibility at Irkutsk, and discharged its duties not only with great zeal, but also most beneficially for the country to which he had been exiled. Distinguished for his talents in civil as well as in military affairs, this persecuted patriot established his family in Siberia. Devoting themselves to scientific pursuits, and to the good of the native people, their house was open to the studious youth of the country who had acquired a knowledge of medicine, mathematics, and the languages of Europe. "Here," says Erman, "we saw Igumnov, whose intimate acquaintance with the Mongol dialects, and other East-Asiatic tongues, eminently qualified him for the office of public interpreter, and who had already some zealous native pupils in his office."†

The importance of these results will be best appreciated when it is considered that prior to the immigration of Germans under Catharine, in pursuance of the plans of Peter the Great, "drunkenness, sloth, and debauchery, with all their concomitant diseases, prevailed there."‡ And it will readily be conceived how much further the improvement would have been carried if these good influences had not been counteracted by the frightful system of convict banishment, which has been truly described by

a modern Siberian poet, as "*the creator of woe in every house.*"*

The German geographers and voyagers of modern times are of surpassing excellence:—the two Forsters, Lichtenstein, Hornemann, Burckhardt, Ritter, the elder Niebuhr, von Humboldt, are only a few in that numerous catalogue. Of the last it is unnecessary to say one word. His name, unrivalled in modern days, represents a whole class of illustrious travellers beginning with Herodotus, who were the lights of their time, and destined by their labours far and wide to preserve to posterity the secrets of the remotest and obscurest regions. Forster, however, deserves particular mention in reference to the spread of civilisation in the parts of the world which he visited with our great discoverer Captain Cook; and in reference also to the fate of the unhappy inhabitants of the new countries then discovered. An individual who also accompanied Cook, the late President of the Royal Society, Sir Joseph Banks, who, with many eminent qualities, was comparatively a man of small capacity, entirely failed in his estimate of the physical resources of New Holland. After mistaking the rushy marshes of Botany Bay for rich meadows, he recommended the House of Commons not to colonize New South Wales; while Forster, on the contrary, clearly saw its vast resources. He did better than this. At a time when the powerful many scarcely noticed the barbarities which voyagers most recklessly committed upon the ignorant people they visited; and when enlightened men were found to vindicate the killing of natives by explorers, as an inevitable and therefore a justifiable proceeding, Forster took the other side, and when denouncing to all Europe at his return the acts he had witnessed, he boldly maintained that they were as needless as they were criminal.

Upon a token of honour being given lately by a distinguished scientific society† in London to Dr. Rüppel, a German friend of that eminent traveller in acknowledging the compliment, enumerated with just pride those of his countrymen whose merits had been long ago recognised in England. The names he mentions, which are among those cited above, attest, indeed, less the liberality of the country which received them with deserved honour, than the genius of the people who, almost severed from the usual incitements to foreign enterprise, namely, fo-

† Report of the Eighth Anniversary of the Geographical Society. Athenæum, 1 June, 1839.

reign possessions, and a great foreign commerce, send distinguished men forth not only as friendly, but also as successful, rivals to those whose more profitable share in such incitements should place them far beyond all competitors.

The Germans, of all enlightened nations, have struggled the most to remove our ignorance respecting India. Whilst such men as Dugald Stewart in Great Britain still persevered in the vulgar error that the Hindus derived their learning from the west, a whole school of Germans, the Bopps, the Schlegels, the Humboldts, and others, following, however, in the wake of the best English Orientalists, had successfully studied the original languages in which Oriental learning lay hidden, and which prove that to the East the West is probably,—we ourselves indeed assert, is certainly, and altogether,—indebted for its early instruction. But what is more surprising, the translations from the Sanscrit published in *English*, both at Calcutta and in London, and which afford valuable illustrations of Hindu character and institutions, are more read in Germany than in England.*

The ablest living anatomist of Germany, Professor Tiedemann, has lately directed his researches with singular felicity to the vindication of the uncivilized man's capacity for improvement. In the works mentioned at the head of this article, and in the translation read at the Royal Society of London, of which the professor is a foreign member, that important question seems to be set at rest for ever. The results of a most exact analysis of cases are thus stated by him :

"I. The brain of the Negro is upon the whole quite as large as that of the European and other human races. The weight of the brain, its dimensions, and the capacity of the cavum cranii prove this fact. Many anatomists have also incorrectly asserted that Europeans have a larger brain than Negroes.

"II. The nerves of the Negro, relatively to the size of the brain, are not thicker than those of Europeans, as Soemmerring and his followers have said.

"III. The outward form of the spinal cord, the medulla oblongata, the cerebellum, and cerebrum of the Negro, show no important difference from those of the European.

"IV. Nor does the inward structure, the order of the cortical and medullary substance, nor the inward organization of the interior of the Negro brain, show any difference from those of the European.

"V. The Negro brain does not resemble

that of the orang-outang more than the European brain, except in the more symmetrical distribution of the gyri and sulci. It is not even certain that this is always the case. We cannot therefore coincide with the opinion of many naturalists, who say that the Negro has more resemblance to apes than Europeans, in reference to the brain, and nervous system."

And after a minute survey of proofs respecting the intellectual faculties of the Negro, Professor Tiedemann concludes in the following words :

"The principal result of my researches on the brain of the Negro is, that neither anatomy nor physiology can justify our placing them beneath Europeans in a moral or intellectual point of view. How is it possible then, to deny that the Ethiopian race is capable of civilisation? This is just as false as it would have been in the time of Julius Cæsar to consider the Germans, Britons, Helvetians, and Batavians, incapable of civilisation. The slave-trade was the proximate and remote reason of the innumerable evils which retarded the civilisation of the African tribes. Great Britain has achieved a noble and splendid act of national justice in abolishing the slave-trade. The chain which bound Africa to the dust, and prevented the success of every effort that was made to raise her, is broken. Hayti and the colony of Sierra Leone can attest that free Negroes are capable of being governed by mild laws, and require neither whips nor chains to enforce submission to civil authority."—*Philosophical Transactions*, 1836, p. 525.

Thus does physical science come in aid of the cause of benevolence; and the rigorous deductions of the calm and philosophical anatomist of Heidelberg sanction the enthusiastic movement of the British people, and justify the decisions of the British legislature.

But it is in the *practical* portions of German philosophy that the best results of German intelligence are to be seen. Derived from all the sources here briefly noticed, and from many more which have been scarcely alluded to, that philosophy has made a great impression upon thinking men in England; and it richly merits the fine eulogium of Coleridge, of having created "*ideas, or laws anticipated.*"*

During the last fifty years especially, these *ideas* have exercised general influence through a very remarkable process. Excluded from a direct share in the local government, and in the foreign relations of their own states, a considerable body of Germans devoted to intellectual pursuits, and

* Dr. Bryce on Native Education in India. 1829. 8vo. p. 161.

* The Friend—Coleridge's Works, 3d ed. 1837. vol. iii. p. 70.

professors in the universities, entered upon the profoundest political abstractions, and the most active philosophical researches bearing upon government. Mere political discussion in the ordinary sense being forbidden, philosophy and history were resorted to for the same object, which elsewhere is sought by political discussion; and the Lockes, the Defoes, the Edmund Burkes, the Juniuses, the Erskines, and the Mackintoshes of England are represented in Germany by the men whose *philosophies of history* are really well-reasoned schemes for the practical reform of all societies. This gives a peculiar value to the writings of the new schools of German philosophical *historians*. To them history has not only been philosophy teaching by examples, but the lessons so learned have actually produced changes in opinion of a nature calculated to impress deep and distinct characters upon the great political events that are preparing in Europe. The earliest writer of these modern schools is said to have been Iselin, who, in Switzerland, in 1764, examined thoroughly the idea that man has innate faculties capable in themselves of complete development; and who treated the history of events as the history of civilisation. In 1773 and 1774, Weguelin in Berlin pursued this theory further; and expounded with many historical details, the results that flow from the *antagonist* principles under which men act. He dwelt much upon the progress thus made inch by inch in the formation of the various political constitutions of Europe. In 1780 Lessing, in a short essay, rested mainly upon religion the improvement of man, with which, he insisted, divine revelation might be reconciled.

Thus arose in Germany three separate schools, quite distinct from that of the philosophical historians, such as Müller, Luden, and F. Schlosser; and from the philosophical jurists, such as Savigny and Mittermaier. The eloquent address of Rosenkranz furnishes a satisfactory, but brief, view of the characteristics of those three schools.

Herder in Weimar became the leader of the first, or NATURAL school; Kant, in Berlin, of the second, or POLITICAL school; and Schelling, in Munich, of the third, or RELIGIOUS school. Of these three chiefs, Herder is unquestionably the ablest, and ought scarcely to be confined to any one of the schools. He it was who first wrote a real philosophy of history. He observed, and reasoned upon every thing,—upon nature, and her works—upon political institutions,—upon religion—and upon the influence of all the arts and sciences on the progress of mankind. Combining all in one grand system, he crown-

ed it with the purest sympathy for the whole human race. So early as in 1775, he published an essay on the subject; and in ten years afterwards appeared his *Philosophy of History*. The perfectibility of man is in the first place demonstrated in this immortal work, from the relations of matter to intellect, and from the innate tendency of intellect to improve; and mankind is then shown to have in fact steadily advanced from the earliest period of its history. Kant supplied what was thus defective in Herder as to the application of his opinions. He holds also that by nature man is capable of indefinite perfection; and that freedom is the grand means of attaining it. Freedom, however, necessarily leads to contention, from which must ultimately and after long struggles, spring well-adjusted laws; the most difficult problem of history being, how to organize civil society so as to make its internal and external relations—the political constitution of different states—produce the greatest possible good to all. To this end each state—as had long before been proposed by the elder St. Pierre—must become a member of the whole commonwealth of nations; for thus alone can an universal peace be obtained. In 1795, Schiller, in Jena, showed that in order to elevate and purify human society, the cultivation of all the arts by minds divested of all undue restraints, must be connected with the political reforms called for by Kant. Schiller's favourite idea, we are told by William von Humboldt in his essay on that great man's genius, was, that the rudest savages are deeply sensible to the charms of music and poetry; and that the elements of all that is refined may be discovered among them, so as to be capable of assuming in able hands a beneficial direction for their civilisation.

In 1804 Fichte, in his lectures delivered in Berlin, connected these speculations with those of the purely religious school of Schelling. Fichte adopts the doctrine of perfectibility through freedom of action. Originally, says he, reason was mere instinct; and then man was an innocent being. With corruption this pure instinct disappeared; and ultimately the human race fell into confusion, and became savage and barbarous. True science will work a restoration; and, after various epochs passed through, the fallen will be perfect again. According to the bold denunciations of Fichte, the present age is in the last degree base. But his system saves him from despondency; and whilst he repudiates every corrupt thing with unsparing scorn, he declares himself, with the earnestness of an enthusiast and the dignity of a prophet, the unwea-

ried advocate of truth and moral goodness, of boundless knowledge, and the tenderest affections.

Schelling placed religion as the basis of all historical deductions. He divides time into three periods. The first was the reign of destiny, which crushed men and nations, and displayed its blind power in the East and in Greece. The second, he calls the reign of nature, which began with the Romans, and continues still. The third period is to come with all its glories, derived from the lessons of the past: the Christian religion being, according to Schelling, the mainspring of human improvement.

Of the numerous theories to which the writings of these remarkable men gave birth, those of Görres, Steffens, and Fr. Schlegel of Bonn are deservedly the best known. Görres pursues Schelling's speculations upon catholic principles: Steffens reasons upon principles of protestantism: Schlegel is by profession a protestant, but leans decidedly to catholicism. The brilliant and highly figurative eloquence of Görres once made a great impression. His analysis of the indestructible elements of society, which he shows to be ever recurring in new and nobler forms of political existence, is a production of surpassing merit. This analysis appeared in his *Europe and the Revolution*. Görres has since lost himself in religious mysticism, and in speculations upon the influence of benevolent despotism in politics.

Steffens has also given a remarkable analysis of the elements of society, in his pictures of the different ranks and classes of men,—the husbandman, the citizen, the scholar, &c. In his work entitled "The present times and how they arose," he develops with great ability the history of mankind since the invasion of the Roman Empire by the barbarians, and since the cotemporaneous establishment of Christianity to our days. He is most successful in the narrative of the last three centuries. His style is wonderfully fine; and has been well described as presenting the German language royally adorned with pearls and gold.

Schlegel's *Philosophy of History*, the production of his old age, can only be looked upon as the result of all that this universal scholar and enlightened man has thought in politics, in religion, in science, and in the fine arts.

Two more names must be mentioned, and they complete a catalogue of which Germany may indeed be proud; we mean Hegel and Herbart. But yet, after all that those eminent men have written, little has

in effect been added to what Herder produced in favour of the steady progression of the human race. To follow the subject completely in his pages, would be to survey all the relations of man, and all the ends of creation. The essential distinction of the human creature from the inferior animals, the enormous error of confounding man with the ape, the intellectual identity of the various human races, their natural tendency to live in peace, the gratuitous cruelty of the usual intercourse of civilized nations with savages all over the earth, the abomination of Negro slavery, the degrees of civilisation which are steps to a higher state of social being, the necessity of studying the language, the music, the government, and the particular condition of savages, the duty of sympathising with all mankind, the poorest as well as the most powerful,—all these things, upon which the public is only beginning to be agreed, are clearly expounded by Herder; and it is no small praise to the Germans, that all parties among them hold him in as much estimation now, as their fathers did sixty years ago.

THE kingdom of Belgium is in some shape, and industriously speaking, the most satisfactory result of the revolutionary movement which eight years ago shook the thrones of Europe. Whilst in France a mistaken policy has hitherto prevented the realization by the nation of the full practical benefits for which its blood was spilled in the three days of July, and whilst the unhappy Poles rue the day when an evil destiny tempted them to lift their arms against their too powerful oppressor, the Belgians are in the enjoyment of as substantial advantages as their most sanguine hopes before the struggle of September ever ventured to anticipate. Their country is delivered from a foreign yoke; their constitution is based on the most liberal principles; their sovereign is of their own choice; and their laws and in-

stitutions, though not yet in perfect organization, are in that state of progression which promises well for the prosperity and happiness of the people.

Our present purpose is not political, but to offer some information illustrative of the institutions and state of society in the Belgic provinces. We have sympathized deeply with this people both in its original struggles for independence, and its subsequent diplomatic martyrdom by means of the thousand and one protocols. We shall, however, confine ourselves here to a passing expression of regret at the dismemberment of the territory, whereby 350,000 inhabitants of Limburg and Luxemburg have against their will been made subjects of Holland. Our observations will be limited to the following heads;—

- 1st. Industrial Operations.
- 2d. Education.
- 3d. Crime and Prisons.

INDUSTRIAL OPERATIONS.

There can be little question in regard to the elements of wealth which Belgium contains within herself, and we shall record them briefly. It will suffice to state, that the population of the Belgic provinces is now near four millions and a half,* and that the working classes, who form about three-fourths of that number, are in their general character industrious and frugal. A fertile soil, nine-elevenths of which is under actual cultivation, and an agriculture so advanced as to be in some respects a model to other countries, produce annually about twice the quantity of corn required for home-consumption. The average price of wheat throughout Belgium in the year 1836, which may be taken as a fair average year, was, in English computation, 35s. 2d. per quarter.† The small cultivators are in tolerably easy circumstances, and the flourishing state of agriculture operates favourably upon manufacturing industry, every branch of which is in full activity. The coal mines of the province of Hainault alone produce more than those of all France together, and the annual quantity of coal raised in Belgium exceeds 2,600,000 chaldrons. The iron mines of Liege, Limburg, and Luxemburg, were never worked so extensively. Upwards of 150,000 tons of iron are annually

founded, being about half as much as the whole quantity made in France, and nearly one-fourth of that in Great Britain. We need not describe Mr. Cockerill's gigantic establishment at Seraing, which with steam engines of not less in the whole than 1000 horse power, and 3000 workmen, sends forth daily for use, some 25 tons of machinery of every description. We heard with regret of the late temporary embarrassment of this distinguished house, but with the aid so timely and judiciously afforded by the Government, are glad to find it has resumed the activity which for the moment was suspended. The cloth manufacture, in which, at Verviers alone, 40,000 workmen are engaged, employs in its various branches a capital equal to three millions sterling. The linen manufacture, principally in the two Flanders, gives employment to 400,000 persons, and the annual production is estimated at four millions and a half sterling. The cotton manufacture, notwithstanding the loss of the Dutch colonial markets, has steadily improved since 1830, and now represents a capital of at least three millions sterling. The manufacturers begin to find the natural home-consumption more advantageous than a forced foreign market, and we were informed, during a recent visit to Ghent, that notwithstanding the loss of the artificial stimulus of the Dutch fund called the "Million of Industry," there were 52 cotton-factories in full activity. The lace and silk manufactures are also thriving. Foreign commerce has, to a certain extent, changed its direction, but there can be no doubt of its being in a healthy state. The value of the imports, on an average of the two last years before us, (1834 and 1835) was 212 millions of francs, and that of the exports, 148 millions of francs. The reader may be surprised to hear that a considerable part of this trade was carried on with Holland, notwithstanding the nominal *warlike* status lately existing; the imports from that enemy averaged 25 millions, and the exports 16 1-2 millions. The Belgians even supplied the Dutch with arms to be used against themselves! The diminution of the trade of Antwerp we believe to be a mere phantasm of the Orangists; the truth being that some large capitalists have suffered by the change of circumstances, and that the trade has passed from the hands of a few, into a wider and more beneficial range. The number of ships that now enter the port of Antwerp is considerably greater than it was at any time during the union with Holland, as the following figures will show:

* On 31st December, 1836, it was ascertained to be 4,242,600.

† In August, 1838, wheat had risen in Belgium to the rate of 50s. 6d. per English quarter, but it will be remembered that at the same period the average of England and Wales had risen to 72s. 11d. per quarter.

Year.	Ships.	Tonnage.
1829 . .	1031 . .	138,945
1830 . .	722 . .	123,407
1832 . .	1258 . .	145,639
1834 . .	1065 . .	138,206
1836 . .	1250 . .	176,461
1837 . .	1426 . .	225,759

The capital invested in commercial speculations in Belgium must altogether be very considerable indeed. Upwards of 300 millions of francs have, since the year 1833, been invested in the *Sociétés anonymes*, which are exclusively restricted to manufacturing operations. The amount of property insured in eleven assurance offices in Belgium was, in 1837, 1,786,832,222 francs, exclusive of marine assurances, and of the value of 200 millions of francs insured in foreign countries. The capital invested in the *Société générale pour favoriser l'Industrie* is 105 millions of francs; that of the *Société des Capitalistes re-unis*, 50 millions; and of the *Société des Actions re-unis*, 40 millions; and although the *Banque de la Belgique*, with a capital of 20 millions, lately suspended its payments, that unfortunate event does not appear to have given any serious shock to banking and trading operations in general. To these indications of natural wealth, we will only add, that the progress of the systematic lines of railways, ordered to be constructed by the law of the 1st of May, 1834, has already advanced so far, that a direct communication is open both between Antwerp and Brussels, and across the whole extent of the kingdom from Ostend to Liege. The undertaking is not only profitable to the government, but, what is very important, places the means of locomotion within the reach of all classes of the population, the fares being properly fixed as low as possible.* We will not dwell on a matter of such notoriety as the facilities of communication which these railways are opening, not only between all parts of the Belgic provinces, but eventually between the east and west of Europe. The Belgian line will be extended in the one direction to the Rhine, and in the other to Paris, and with it the commerce of Belgium cannot but acquire a large prospective increase of activity and expansion.

EDUCATION.

The educational institutions of Belgium are of three kinds,—the primary schools, the colleges or secondary schools, and the universities. Of these, by far the most import-

ant branch is that of primary or popular instruction, of the actual condition of which M. Ducpétiaux has furnished us with a very complete account in the work before us.

Public instruction may be entirely unrestricted, as in England; or it may be placed under the exclusive control of the government; or a mixed system may be adopted, of vesting the general superintendence in the government, but with liberty to individuals of teaching, and keeping schools, without any previous permission of the government for that purpose. Before the Belgic Revolution, the government had the exclusive superintendence, by virtue of a clause, in the fundamental law of the Netherlands, to this effect:—"L'instruction est un objet constant des soins du gouvernement. Le roi fait rendre compte tous les ans aux états généraux de l'état des écoles supérieures, moyennes, et inférieures,"—subject to a concurrent surveillance of the athénées and colleges by the municipal authorities. The primary schools were superintended by provincial boards nominated by the government, and all teachers were subjected to examination, and to receive diplomas, or certificates of capacity, without which they were prohibited from teaching at all. The line of examination taken was such that the Catholic clergy could not conscientiously submit to it; and so much was required of the candidates, that the competition of private teachers with the public schoolmasters was gradually excluded, and numbers of private boarding and day schools were obliged to be discontinued. The government succeeded in monopolizing to itself the education of the people upon the Dutch system;* and whatever may be the merits of that system in other respects, it was obviously so inappropriate to the circumstances of Belgium, that it is no great wonder the Belgians regarded it as an injury and an insult, and that it formed in fact one of the proximate causes of the Revolution. The right of private instruction had always been free in Belgium at all former periods of her history. Education had, in truth, been practically neglected, both by her Austrian and French rulers. Joseph II., indeed, made some laudable efforts; among which was one for the establishment of normal schools, but they resulted in nothing; and the legislation of the French revolutionary period also failed, principally by reason of its making the national instruction contingent upon its being solicited by the inhabitants of particular districts;—a contingency not in unison with the habits of the mass of

* The fares in the open waggons are, from Brussels to Ostend (85 English miles) 3½ francs; to Liege (70 miles) 3 francs; and proportionately for shorter distances.

* For the details of the Dutch system, see M. Cousin's *Treatise on Education in Holland*, translated by Mr. Horner.

the people any where, as experience has fully shown. The Dutch system, with all its faults, was far more successful than any previous educational experiment that had been made in Belgium. It appears that in the interval of eleven years, between 1817 and 1828, the number of pupils frequenting the public schools had increased from 152,898 to 247,496, and the amount of salaries paid to the *communal* teachers, from 157,580 to 488,150 francs. In the same space of time 1146 schools and 668 teachers' houses were built or repaired; 1977 masters and 168 mistresses were licensed; and the revenue raised from the *communes*, the provinces and the state, for educational purposes, was gradually augmenting. These facts are candidly recorded by M. Ducpétiaux, who fully admits the benefits which the country derived from the Dutch system. The methods of teaching were improved; one normal school was established, as well as several model schools, in the great towns; and the provincial juries put the schools into organization with an efficiency which, if free competition had been permitted, would have been highly desirable. But no system of policy could be lasting which was so decidedly opposed to the great principles of social justice and religious toleration, and which interfered so directly with the national language and feelings. Accordingly M. Ducpétiaux informs us that in 1828 its downfall was preparing.

"From 1828 began to show itself, in the southern provinces, the reaction of opinion against the monopoly assumed by the state in regard to instruction. That system, to which the liberals had at first given their consent and support, but which the Catholics had received with reserve, was openly attacked by both in its tendencies, avowed or secret. It was reproached with admitting no competition, and converting education into an instrument of Dutch and Protestant propagandism; the proscription of the teaching religious congregations who had refused to submit to the forms of examinations and degrees, excited also just reprehension. The substitution of the Dutch for the French language in many schools, the disgust of the teachers who refused to comply with the prescribed rules, the sort of discretionary power exercised by the inspectors of districts in the name of the government—stirred up interests and susceptibilities easy to be excited and alarmed. In spite of the decided hostility of public opinion, the government, in 1829, determined to propose to the legislature a project of law intended to redress grievances, based upon the principle of the free exercise of instruction. But this law was withdrawn in the month of May in the following year, in consequence of the discussions to which it gave rise in the Second

Chamber. Soon afterwards the Revolution of September destroyed at once the Dutch dominion in Belgium, and the system of instruction which it had introduced into our country."—Vol. i. p. 61.

The constitution of the new kingdom of Belgium proclaimed the general freedom of instruction in these terms:—"L'enseignement est libre : toute mesure preventive est interdite : la repression des delits n'est réglée que par la loi. L'instruction publique donnée aux frais de l'état, est également réglée par la loi."* The new government abdicated entirely all the coercive powers exercised by the Dutch king and the provincial boards acting under him, and limited the superintendence of the latter to the schools supported by the public treasury either wholly or in part. Diplomas, though permitted, were no longer obligatory, and inspectors were appointed on the recommendation of the provincial states (the elective body.) Finally, the provincial boards were wholly suppressed by a decree of the Regent, reserving only to the government the right of inspecting the schools paid by the state, as it should deem fit;—a right, however, which hitherto it has not thought proper to exercise.

The constitutional charter evidently contemplated a subsequent law for the regulation of public instruction, and commissioners were appointed, in 1831 and 1834, for this purpose, who framed two distinct *projets de loi*; but neither of them has been adopted by the legislature. At present, therefore, instruction in Belgium is subject to no legislative enactment beyond the general dispositions of the constitution. The government has no power, except as regards the schools in the pay of the state; the rest depends upon the pleasure of individuals and the caprice of the communal councils, who in many cases have refused any aid whatever out of the funds of the *commune*. Thus the communal schools on the Dutch system have, in their turn, been forced to give way to private schools, of an inferior description: bad school-masters have taken the place of good ones; and there is no longer any normal school in existence. The allowance to the government schools is considered insufficient; and although in some towns (especially at Ghent and Liege) the inhabitants have exerted themselves to keep up their schools, things are, upon the whole, in so unsatisfactory a state, that in Brussels, according to M. Ducpétiaux, the proportion of children attending the primary schools is scarcely 1 in 20 of the population of the city.†

* Art. 17.

† These remarks were made at the close of the year 1838.

It cannot excite surprise that, under this do-nothing system, education in Belgium should rather have retrograded than made progress since the Revolution. At least one-third of the rising generation (M. Ducpétiaux considers one-half) are absolutely without any regular instruction; for, reckoning to every seven inhabitants one child of a fit age for school, the public and private schools together ought to contain 600,000 pupils; whereas they are only attended by about 420,000, of whom 185,000 are girls, who are therefore worse off in proportion than the boys, the numbers of both sexes in Belgium being nearly equal. The following table compiled from the official returns, will show the numbers receiving instruction at periods before and since the Revolution :

	Year 1826.	Year 1833.	On 31 Dec. 1836.
Number of schools, viz.			
Communal } 2170 469
Mixed }	2054	2590
Private	487		
Total	2541	5220	5622
Number of scholars, viz.			
In common schools . . . } 185,089 175,661	
Mixed do. }	187,722	46,774	92,357
Private do.	119,858	139,133	153,285
Total	307,580	370,996	421,303
Proportion of scholars to the whole population . }	1 in 10.7	1 in 11.3	1 in 10.7

The provinces of Luxemburg and Namur are those in which instruction is the most widely, and the two Flanders and Liege those in which it is the least diffused. Comparing Belgium with other countries, in respect to the diffusion of instruction, she stands just below Austria, and just above England. She is several steps above France and Ireland, but falls very short of Holland, the Swiss cantons, Prussia, Bavaria, Scotland, the United States, and of every country indeed where education is pretty widely spread.

But it is not the mere deficiency of instruction that is to be lamented. It rarely happens that anything is taught beyond the elements of reading and writing, and in the summer season one half of the children enumerated as scholars are employed in the fields, and do not attend school at all. The increase of private schools affords of itself a strong presumption of the inferiority of the teachers; for, whilst in 1828 there were only 2145 teachers with diplomas attesting their capacity, we have seen that in 1836 there were no less than 5622 schools, and reckoning but one teacher to each, we have thus more than 3000 teachers of whose fitness no proof has been given. All these circumstances concur in showing the very bad state into which the education of the people has fallen in Belgium, and the necessity of the legislature's adopting some early and decisive measures for its improvement.

M. Ducpétiaux, who is never weary of promoting the welfare of his countrymen, has, in the work before cited, suggested a

measure, in the shape of a *projet de loi*, which has been favourably received by enlightened persons in Belgium, and is not unworthy of attention in other countries. His plan is briefly this. Primary instruction is to be declared either private or public. Private schools to continue unrestricted in every respect, except that their existence is to be notified to the authorities. The public primary schools to be of three kinds, viz. guardian schools for children from two to six years old: elementary schools, in which are to be taught morals and religion, reading, writing, and arithmetic, weights and measures, and the French or German language, according to circumstances: and superior primary schools, in which the instruction is to be still further advanced. The number of schools to be on a scale in proportion to the population. Model, and normal schools, unions of teachers, and circulating libraries, to be also established. All parents either to send their children to the public schools, or to provide sufficiently for their instruction elsewhere, from the age of six to fourteen years. Teachers to be appointed by the communal councils, on the recommendation of local committees. Committees of examination to be appointed for each province. The primary schools to be maintained by the *communes*, the model schools by the provinces, and the normal schools by the state. An inspector-general to be appointed for the kingdom; and reports to be made periodically to government and the Chambers. Such is M. Ducpétiaux's plan, which develops a more complete system than that of

either of the commissions referred to, and the leading features of which are by no means unlikely to be adopted by the legislature.

It has been well observed by M. Ducpé-tiaux, that a system of national instruction would lead incidentally to the correction of that enormous evil,—the over-working of children in the factories. There is at present no legislation in Belgium on this subject, and there are to be seen in the manufacturing at Ghent, Liege, and Verviers, thousands of young persons, whose pale and etiolated faces proclaim the rapid decay of their health and strength. *Their hours of labour are thirteen and even fourteen hours daily.* We are well aware of the difficulties of restricting factory-labour, without placing the manufacturing interest itself in jeopardy, and we are inclined to think a general educational law would in all countries prove a better remedy than any special legislation in regard to working hours.

The second or intermediate branch of Belgian education, consists at present of the colleges, or *Athénées*, established in all the large towns. These are maintained principally by the inhabitants, but receive in addition some aid from the state. The classics, modern languages, history, geography, and the mathematical and physical sciences, are taught pretty much upon the Dutch system. Beside these, there are other colleges for general education, under the exclusive management of the clergy. The Jesuits alone have established four,—at Brussels, Namur, Alost, and Ghent. These are intended to compete with the *Athénées* in the education of all classes, and it may easily be supposed are conducted with a more marked religious bias. They are distinct from the theological seminaries, established in each diocese, for the special training of the priesthood. The schools of industry, of painting, music, &c., belong also to this branch of education. They are numerous and well attended.

Belgium contains four universities; two of the States, at Liege and Ghent, which existed also during the union with Holland; the Catholic University of Louvain, founded by the clergy; and the free University of Brussels, established by private association. The number of students, according to the last returns before us, was as follows:—

Liege (Session 1837-8)	317
Ghent do.	260
Brussels do.	210
Louvain, (1 January, 1838)	416
Total number receiving superior instruction	1203

The freedom of university instruction is almost as complete as that of the schools. Universities have been erected quite independently of the government, and without being in any way responsible to it for the system pursued. Degrees, however, can only be conferred by the central body, called "*le jury d'examen*," at Brussels, composed of members of the several universities, out of whom the jury is selected which assigns the university honours. Both the private and the state universities are equally obliged to resort to this central jury for their degrees; but, beyond this, their systems of education are not subjected to any standard or rule.

The idea of a free university originated with the Catholic party, who did not, however, give their establishment the title of Catholic, until the liberal party had begun to set up another in opposition. It was opened, under a bull of institution from the Pope, in November, 1834, at Mechlin, with all the éclat of a high mass, and a Latin oration from the rector, (the Abbé de Ram,) demonstrating the consistency of the Catholic faith with the progress of the arts and sciences; and it was afterwards, by the favour of the government, removed to Louvain, the seat of the most ancient University of Belgium, and recently of the Philosophical College, with which King William so injudiciously scandalized his Catholic subjects. The Catholic University has unquestionably been a successful attempt; its numbers have gradually increased from 86 in its first session, to between 400 and 500, and it bids fair to become an important post of clerical ascendancy and Catholic propagandism.

The Liberal University was founded in Brussels within a few days after its rival. In addition to the ordinary course of study, it claims the merit of a fifth faculty, dedicated to political and administrative science, with a view to the qualification of students for public life. It numbers among its professors men of considerable distinction in science and philosophy, but these professors have been very inadequately remunerated. The liberals have not, in fact, supported their university so well as the Catholics, whose zeal in the cause has been quite overflowing. But there is, we trust, no fear of Brussels being able to maintain an institution so peculiarly adapted to prepare the Belgian youth for a sphere of public usefulness in after-life.

We cannot stay to inquire here into the many important considerations which occur in arranging a scheme of national education. But there is one point upon which its success in Belgium will probably depend

more than upon any other; viz. its connection with the religion professed by more than nineteen-twentieths of the population; that is, the Catholic faith. There are, in fact, only a few thousand persons belonging to other persuasions. The Belgians are in general warmly attached to their religion, and the fate of the Dutch government ought to be a standing proof of the folly, not to say wickedness, of attempting to proselytize them from their ancient creed. We do not believe the Protestant form of Christianity to be suited to the Belgian temperament and character; but however this may be, the fact of Protestantism never having made any progress in the Belgic provinces, is enough to show that, in whatever the legislator has to do with religion, he must at least respect Catholic institutions. It is true that no established church is recognized by the constitution, which, like that of France, declares liberty of conscience for all persuasions, and assigns stipends to the ministers of all, even of the Jews. But still, Catholicism is practically the national belief; and the Catholic clergy, by their numbers alone, cannot but keep alive a mighty influence over the public mind. There is the Archbishop of Mechlin, (the well known M. Sterx, lately elevated to the rank of a cardinal,) with five bishops, a proportionate number of vicars-general and canons, a staff of 4731 secular clergy, and 333 monasteries and convents, inhabited by the regular clergy and female devotees. The clergy as a body unquestionably command the reverence of the people, more especially in the rural districts, where they exercise considerable authority in political matters and march their flocks up to the poll at elections in such excellent discipline, that in some parts of the country, no opposing candidate has any chance against the protégé of the priesthood. We will not dissemble that the Belgian clergy are keenly alive to the interests of their church, and that they desire to sway their flocks in worldly as well as in spiritual affairs. But they are certainly not an ignorant and bigoted clergy, in the sense in which those terms are applicable to the priesthood in some other countries.

"We cannot doubt," says a late intelligent observer—himself a Protestant—"that the Belgic clergy has in itself enough of the spirit of the Gospel to act as an antidote to the tendency, which the sense of political power has, to deprive man of that healing balm—the sentiment of profound submission to God. . . . It would be unjust to compare the clergy of Belgium to that of Spain, for in the latter country two things are wanting, which in the former exercise a most salutary influence, the

mildness of the national character, and the advanced state of civilisation.*

The Belgian clergy have participated, some of the inferior orders very strongly so, in the liberal notions of their times; and, far from any hostility to the education of the people, they have shown every possible disposition to further it, provided only it be based upon religion,—by which is meant, of course, Catholicism. A circular letter from the Archbishop of Mechlin, now before us, is in substance to that effect.

Now the promoters of public instruction, rightly considering it a *sine quâ non*, that religion should in all cases be taught in the schools, have, without hesitation, agreed to place it under the superintendence of the clergy, saving the rights of conscience of dissenting parties. The commission of 1834 and M. Ducpétiaux have alike adopted from the French code the following declaration, as a part of their plans: "L'enseignement de la religion est donné sous la direction de ses ministres: le vœu des pères de famille sera toujours consulté et suivi en ce qui concerne la participation de leurs enfans à l'instruction religieuse." Thus the schools will be essentially Christian; teaching generally the elements of the religion approved by the mass of the nation, and making at the same time adequate provision for those who differ from it. We should not anticipate in Belgium any practical difficulties in the working of this plan, which will secure the co-operation of the clergy, and we trust lay a good foundation for the improvement of the lower orders. In countries like England or the United States, where a variety of religious sects are constantly coming into contact with each other, the difficulties of making a satisfactory arrangement for conveying religious instruction in the national schools are greatly enhanced. To these the circumstances of Prussia are more analogous: there, according to M. Cousin, religion is uniformly taught in the schools, provision being made that there shall be teachers as far as possible of all sects, and where this is impossible, the parents are themselves to educate their children in their own tenets. But, says the Prussian code, "in every school in a Christian state the predominant spirit, and which is common to all sects, is a pious and profound veneration for Almighty God." This is a sentiment which most will agree ought to pervade the laws that regulate national education in all countries. In surrendering to the Catholic clergy the general superin-

* Lettres sur la Belgique, par Loebel, Professeur à l'Université de Bonn. 1837.

tendence of religious instruction, the Belgians may perhaps sometimes find that clerical zeal will outrun discretion; but the schools will be the foundation of the best bulwark that can be erected against excessive clerical pretensions,—namely, the growing knowledge and discernment of the people themselves.

CRIME AND PRISONS.

The state of crime is, of course, one of the most important indices to the morality of a nation; and we shall therefore refer to some statistical data illustrative of this point. It will be seen that crimes have considerably diminished since the Revolution; and although we are not exactly prepared to say that the separation from Holland has had a direct moral effect, still it is satisfactory to know that the Revolution cannot be charged with having introduced an increased propensity to crime. In all countries ignorance and poverty may be regarded as the immediate progenitors of offences; and it is by the removal of these evils, rather than in the perfection of penal systems, that the way is really to be prepared for lightening the criminal calendars, and relieving the prisons. From what has been said, it will easily be supposed that education is not sufficiently diffused in Belgium to operate with any great force towards the reduction of crime; the cause of its diminution would seem rather to lie in the improving circumstances of the people in wealth and ease, and in the growth of those industrious and careful habits amongst them, which are the strongest antidotes against temptations to violate the laws. The small cultivators, who form a very numerous class of the population, are remarkable for their industry, forethought, and economy.* The system on which relief is administered to the poor is by no means free from objections, but the inmates of the dépôts of mendicity, and the poor colony of *Merx-plas-Ryckevorsel*, have decreased in numbers since the Revolution; and the gradual increase of the deposits in the savings' banks is particularly gratifying. In 1833 the amount of these deposits was between three and four millions of francs,—in 1835 it reached 13,707,348 francs,—and on the 1st of March, 1838, it was no less than 39,971,634 francs. We cannot but consider such facts as these to be closely connected with the diminution of crime which we shall show to have taken place since 1830.

The administration of criminal justice and classification of offences being very

much the same in Belgium as in France, we have the ready means of comparison between the two countries; and by that comparison it appears that the number of persons annually charged with crimes is 40 per cent. less in Belgium than in France. The average annual number of persons accused of crimes in Belgium was,—

Years	Inhabitants.
1826 to 1830, 767, or 1 in every 5007	
1831 to 1834, 620, or 1 in every 6724	

which exhibits a general diminution of about 25 per cent. The diminution appears to have been the greatest in the province of Brabant (in which Brussels is situate), where it was as much as 42 per cent., and the least in Luxemburg, where it was only 4 per cent. In speaking of crimes, we mean offences of a grave nature, and tried by the courts of assize. In regard to minor offences, (*delits correctionnels*) the average number is also less in Belgium than in France, but it has remained nearly stationary in Belgium during the two periods referred to; the numbers charged having been,—

Years.	Inhabitants.
1826 to 1829, 22,641, or 1 to every 171	
1831 to 1834, 23,443, or 1 to every 173	

The acquittals are stated at from 15 to 20 per cent. of the accusations for crime, and at nearly 25 per cent of the correctional charges.*

Capital punishment forms a part of the criminal code of Belgium, but its execution is gradually becoming less and less frequent. Its secondary punishments consist wholly of different degrees of imprisonment, the *bagnes*, or galleys, having been for some time past abolished. The penal prisons consist of the *Maison de force* at Ghent; the *Maison de reclusion* at Vilvorde; the house of correction at St. Bernard, near Antwerp, for correctional offenders, with a separate ward for boys; and the military prison at Alost. The number of persons confined in these prisons has lately averaged from 3600 to 3700. In addition to these a distinct prison for convicted females is in progress of erection at Namur. In the chief town of each province there is a *maison d'arrêt et de justice*, for the accused, and those condemned for short terms; at the chief towns of each arrondissement a *maison d'arrêt*; and about 150 *maisons de dépôt*, or police stations.

We have devoted some personal observation to the management of these prisons,

* See the Report of George Nicholls, Esq. on the Condition of the Labouring Classes in Holland and Belgium, 1838.

* See the official document entitled, "Compte de l'Administration de la Justice Criminelle en Belgique pendant les années 1831 à 1834," published by the minister of justice in 1836. The account has not been continued to a later date.

and have no hesitation in pronouncing them very inadequate to their purpose, both as penal institutions and places of safe custody. The old vicious system of association continues to prevail, and the legitimate ends of punishment are made so subordinate to those of profit derivable from the prisoner's labour, that the establishments at Ghent and Vilvorde are, in fact, great manufactories rather than prisons.

The Belgian army is almost entirely equipped by the labour of the prisoners, which is assigned to contractors for each particular branch of work. As an inducement to labour, the prisoners are allowed a portion of their earnings; and of this portion one-third only is required to be set aside as a reserved fund, the other two-thirds being allowed to be spent at the canteens, which are to be found in all the large prisons. Meat, tea, coffee, beer, and tobacco, are permitted to be sold in the canteens; and, we were assured, that, but for this indulgence, it would be found difficult to get the work done by the prisoners. Now we are fully aware that the treatment of prisoners, confined for long terms, will always require considerable modifications of general rules; and in the penal prisons of Belgium, offenders are confined for terms of twenty years and upwards, or for the residue of their lives. We even saw an old man in the *Maison de Force* at Ghent, who had been a prisoner for sixty years! But we are convinced that it is perfectly idle to expect in Belgium, or any other country, either the repression of crime, or the reformation of offenders, from a system of prison discipline such as that we have been describing. M. Ducpétiaux, the inspector-general, is fully aware of its worthlessness; and in his valuable work on the Penitentiary system, prefixed to this article, has given the most satisfactory reasons for preferring a system of entire separation of the prisoners from each other. The government has also so far approved the latter system, as to cause an addition to be made to the *Maison de Force* at Ghent, comprising thirty-six cells, of sufficient dimensions to become the habitation of prisoners in a state of complete separation. We have some doubts whether the construction of these cells is such as effectually to preclude communication; but, at all events, the experiment is creditable to the Belgian government, as manifesting a desire to introduce into its prisons the system which the most experienced persons concur in recommending, as that which alone affords a prospect of any satisfactory moral results.

Discharged criminals are placed under the surveillance of the administrative com-

missions, and colleges of regents, who take measures to provide them with employment. This is no light difficulty in any country; and continually brings us back to the paramount importance of the systematic education of the people. For, upon a recent inquiry, it was found, that out of every hundred offenders detained in the penal prisons of Belgium, sixty-one could neither read nor write, fifteen had received partial instruction, and twenty-four only could read and write fairly. Such facts speak more than volumes of argument, for sending the schoolmaster abroad, with all speed, throughout the Belgic provinces.

ART. V.—1. *Kant's, Im., sorgfältig revidirte Werke.* Gesamt-ausgabe, in 10 Banden. — (Kant's Works, carefully revised. Complete edition, in 10 vols.) Leipzig. 1837 to 1839.

2. *Kant's, Im., Sämmtliche Werke.* Herausgegeben von Karl Rosenkranz and F. W. Schubert. (Kant's Complete Works, edited by Rosenkranz and Schubert.)—Vol. I. to VIII. Leipzig. 1837 to 1839.

It is not when the cold grey dawn of morning is first visible above the horizon, and the student, recruited by rest, feels empowered to grapple anew with the intricacies of some subtle argument; it is not when the sun attains his meridian, and the sense delights in visions of spar-studded grottoes and crystal fountains; it is not at the gentle vesper hour, when sweet emotions and kind sympathies are busy with our nature—but in the dead hush of night, when outward scenes and earthly relationships seem lost in the silence of Solemnity; when the soul retires from the external sphere, into the inmost world, and marvels that the common cases of Life should ever disturb her sublime repose; when she hearkens, a loving disciple, to the teachings of intuitive conscience—then is the time when the Philosophy of Kant is most worthily appreciated. The state of mind which he requires is not activity—that is too restless; not lassitude—that is too dormant; not affection—that is too tender; but an elevated and wakeful submission, wherein truths are *communicated* by Reason, rather than *acquired* by Perception.

In a sympathetic estimation of Kant's Philosophy, there is first generated within the breast an indifference to, if not a doubt of, the world's material existence. The thoughts are then directed to a different order of things, where we are fully compensated for losing the empirical charms of sense, by

a more dignified perception of moral and legislative Reason. Kant, it is true, deprives that reason of a hundred interests with which other teachers have associated it. He neither looks with Fichte at the combat which ensues between Reason and the outward world as a sort of knightly tournament, wherein the Mental Power is the perpetual antagonist of Sense. He seeks not, with Wolf, to impose upon the Sovereign Faculty the mighty task of harmoniously perfecting the relationships of Spirit and Matter. He neither demands of it, with Schelling, enthusiasm for a religious system, nor presents to it the ideals of Hegel, to be realised in national, social, or family life. All these are interesting theories, which vanish with the close of day, and are lost in the oblivion of the midnight hour, when Kant summons before our eyes the magic power of *Will*, and commands us to submit implicitly to practical reason's abstract law, called Duty.

This law Kant renders most prominent, impressive, and distinct, by divesting it of all the insinuating and alluring garbs wherewith, for the sake of attraction, both ancient and modern philosophers had apparelled it. They pointed out the beneficial results accruing from a strict fulfilment of duty, and sought to enlist the mental and moral faculties for the service of a stern though just Sovereign, by holding out hopes of speedy psychical promotion, and the realization of whatever ideal majesty Poets had ascribed to the soul. These were the highest motives exhibited to induce obedience to the law Duty; others of a less elevated character were not wanting. Kant, however, considered all such coaxing discipline equally futile and injurious. Reason demanded acquiescence; and she would make no compact with Inclination for the honours which Deity had chartered to her sway.

The novel mode of thought opened by Kant is not only distinguished by its contemplative depth, and the strange mental world which it opens to the disciple, but for its immense progeny of notions, now become inalienably connected with all metaphysical theories. How many use with fluency and instinctive refinement of diction, the categories of *subject* and *object*, without once reflecting that Kant, in his criticism on Reason, first moulded those notions by a slow and persevering process into that philosophical profundity which has since rendered their application general and practical. Indeed every existing mode of thought is thoroughly tinctured with the categories of Kant, not to mention the various theories professedly based upon his system. Nor can we, by any possibility, travel out of his sphere. We

shall now endeavour to sketch, as briefly and clearly as possible, the outlines of that powerful system which has wrought so great a revolution in modern philosophy.

The doctrine of Kant is Idealism; and, not common, but transcendental Idealism. The difference between the two is this—Common Idealism considers the whole existing world as deception and shadow; and admits not the existence of objects in themselves, but only of the notions which we entertain concerning them. Transcendental Idealism, on the other hand, allows the existence of an external universe, but denies that we know it as it really is. It permits us only to be conversant with those *apparitions* of Nature which rise before our perceptive or cognitive faculties. Common Idealism never deals with the outward world as a result, but with its constituting qualities; while the transcendentalist only denies a perfect correspondence between objects themselves and the virtues which simple and uncritical consciousness supposes in them. Thus simple Consciousness considers that all which comes in contact with sensible perception; such as colour, form, continuation of parts, their connection, &c.; are contained in the object itself and constitute its real substance—while Transcendental Idealism discerns in the object the mere reflection of the cognitive Power in Man, which engraves upon the surface of sensible nature the impression of an innate law, resident in human existence. With the transcendental philosopher, the whole of the material world rests between two inscrutable points, as its two poles—between the objects themselves, on the one side, and the power of Cognition on the other. These two extreme polar points—absolute *object* and absolute *subject*—have undergone further investigation by Kant's successors. According to his theory, however, Object and Subject form the boundaries of both Theory and Experiment.

All the notions which we form of objects—all the qualities which we attribute to them—are derived either from the impression of external Nature on the Senses, or from the innate forms which dwell in human perception. All we really know, therefore, of outward objects is, that they ARE; but WHAT they are, remains, according to Kant, a perfect mystery. With the same mystery he likewise shrouds the true character of the pure subject in man, since its existence is real, and it may be contemplated as an object by itself. All the proper qualities which the subject discovers in itself, to wit, the faculties of thought, feeling, desire, &c., only indicate PARTS of the innate experience and conceptions of which it is capable. Thus

our real knowledge of the subject is bounded by its existence—we are ignorant of its absolute essence. On the other hand, the manifold forms of our perception, (which perception may be termed the eye of the subject,) and the objects of the outward world, Kant admits to be perfectly intelligible and fully developed. He divides Forms into two classes; the one he distinguishes as *à priori*, the other as *à posteriori*. By the former he understands all that is necessarily contained in our intellect, apart from experience. The latter, on the contrary, signifies with him, every thing that is deduced from the exhibition of facts.

The *à priori* class is of a twofold character. It comprises forms by which we behold and view, and forms by which we deliberate and judge. Of the former kind are SPACE and TIME, together with all that we know in and by them; viz. the three dimensions, as the properties of space; the mathematical figures, as its possible divisions and sections; the arithmetical progressions, which originate in the ascent and descent in the sphere of Time, with all the various forms of locomotion, as changes of time manifested in Space. The body of these Forms of views, so far as they have been ascertained by Science, presents to us an infinite field of endless and varied manifestations, in which all the phenomena, by a law of necessity, appear under the one or other aspect.

In proportion as the phenomena appear engrafted on those Forms, we judge of them as, in a greater or less degree, objects of experience. The relations which we discover between the phenomena and the *à priori* forms of Time and Space, constitute the substance or nature of our judgment on matters of experience. In order, however, to render the judgment complete, we must add to it the second class of forms *à priori*.

The forms of judgment fall under four Rubrics. We make, *imprimis*, either one thing, several things, or all things,—the object of inquiry and adjudication. The form which comprises that process, Kant terms THE CATEGORIES OF QUANTITY. Our reason then proceeds to grant or deny a certain predicate to a certain object. The form comprising this process Kant calls THE CATEGORIES OF QUALITY. But as in attempting to judge of an object we are compelled to contemplate the qualities with which we are about to invest it, a third form ensues, which consists in the relation of the Substance to its accidents. Two conclusions or judgments may likewise be so combined that one may be the accident of the other. Thus in saying, when the sun rises it becomes day, becoming day is the accident or effect of the

Rising Sun. The forms of judgment, of substance and accident, of cause and effect, Kant distinguishes by the common title THE CATEGORIES OF RELATION.

The fourth form consists in our positive or negative conclusions with respect to the objects of judgment. A fact or thing attains its highest degree of certainty by proof that difference or contrariety are, with relation to itself, impossible. Certainty then becomes the exhibition of Necessity. Kant designates the forms of necessity, possibility, and certainty, by the term CATEGORIES OF MODALITY. Thus concludes the second branch of *à priori* forms in their most essential bearing.

Our knowledge is the result of a concurrent operation in both divisions of the *à priori*; viz. the forms by which we behold, and those by which we judge. Every form of judgment has its peculiar mode of operation in the field of viewing and beholding. Thus if we perceive therein a regular order of successive and similar phenomena; such as, the sound which ensues every time we strike upon a glass; the freezing of water whenever the cold has attained a certain degree; the display of colours whenever the sun shines;—we are then conversant with those phenomena which give rise to the categories of Cause and Effect. On the contrary, a regular order of succession in a varying object,—such succession, for instance, as may be discerned in water changing from congelation into fluid, then into vapour or steam;—the converse process;—the moon's full aspect changing into the crescent form;—childhood, as one mode of humanity, giving way to senility as another;—the senses, vigilant during the day, surrendering themselves to sleep in the night;—such order of succession gives rise to THE CATEGORIES OF SUBSTANCE AND ACCIDENT. The changing states we term Accidents, and the object in which the mutation is wrought we call Substance.

The knowledge of things is, with Kant, the result of an extremely artificial machine. The wheels do indeed revolve by, and within, each other, and by their complicated action the science is, so to say, properly manufactured. All things which we *know* have previously undergone the process requisite to recognition:—in fact, to know a thing, is simply to invest it with the results of the *à priori* operations in connection with it. We are ignorant of the *raw* material of the objects. Thus, the metaphysics of Kant refuse us a view into the super-sensual empire of things as they really are. The suspicion which has been often entertained that the deceptive and chimerical are inseparable from the mere realm of sense, is much fos-

tered by the doctrines of the philosopher under consideration. His tenets, on the other hand, frustrate our hopes of arriving at the knowledge of things by reflection and reasoning concerning nature and the universe.

We have now arrived at that stage in Kant's system where perfect darkness veils from our view the nature of the external world. It is in vain that the soul in accents by turns commanding, expostulatory, and persuasive, interrogates Nature of her Secret. All is still as the grave; and the opaque atmosphere arrests even the voice of Echo.

But although the mind pauses in bewilderment before the mystery which rests on the sphere of outward inquiry, it discovers when it returns within itself a system of wonderful consolation in the resolution of THE WILL. Inspired by divine consciousness, it no longer carries study and investigation into the region of natural phenomena, but fortifies itself with stern determination—in the sphere where it RECEIVES instead of DISCOVERS—to believe in, and hope for, all the blessings to which man is fairly entitled when he conscientiously practises the Moral Law uttered by our Practical Reason.

The resolution to consider oneself as a member of a spiritual world extending far beyond the limits of this life, is identical with the determination to take the moral law as the standard for our conduct. For that law commands us to act in a way becoming members of a higher sphere; and it is impossible to practice it without fully believing it. Our RESOLUTION thus becomes identified with our belief, and shares all its fruits and consequences.

No sooner do we believe in the existence of a spiritual world, and resolve to act as becomes its members, than we acknowledge ourselves creatures belonging to two spheres, and arrive at the position from which Kant himself acted, thought, and lived.

The proud consciousness that we, though linked to a low nature by the *a priori* forms of both spheres, transcend in the majesty of an individual being, and in the loftiness of our destiny, the entire aggregate of the material universe; and that we are permitted even from our low position an insight into the glorious future; this consciousness pours balm into the soul, and causes it to forget the toils of the way in the prospective of its end.

Kant's own life bears witness that he fully felt the truth of his theory. He never for a moment quitted his native place, Königsberg. He was born in 1724, the year of Klopstock's nativity. His parents were poor but respectable persons, of Scottish extrac-

tion. His whole life was as a smooth river on which the image of the Heavens rested in undisturbed entirety. His existence was one of perpetual thought and contemplation. He was appointed Professor Ordinarius in the year 1770, when he published his Latin treatise "*De mundi sensibilis atque intelligibilis formâ et principiis*," in which he for the first time revealed the ideas afterwards fully developed in his criticism on pure reason. This treatise was a sealed book to the public in general, on account of the dead language in which it was written and the strict mathematical form in which it was couched. Seventeen years of comparative neglect rolled over his serene and thoughtful existence. In 1787 he published his celebrated work, the *Criticism on Pure Reason*. This, however, did not bring him into public notice until 1792, after he had been for five years exposed to the polemic attacks of the learned of all countries. At that time Kant was in his sixty-eighth year—he had published, however, when only twenty-two, a treatise in which we fully discover the fundamental idea expressed in his great work given to the world nearly half a century afterwards. In the treatise referred to, young Kant undertook nothing less than a philosophical expedition against Leibnitz, Des Cartes, Benaali, and many other celebrated writers of the day, and set himself up as an umpire to decide the controversies which were then carried on with great zeal between the schools of Leibnitz and Des Cartes.

The treatise, as it did not espouse the opinions of either school, remained wholly unnoticed. Kant bore this neglect with the greatest equanimity. So entirely had he realized the truth that prompted his assertions, that it had become an element in his existence. His Being was the world in which his philosophy made triumphant progress day by day: his views were too much associated with reality to be affected by the patronage or the dissent of the Public.

The thinking world was at that time divided between two opposite systems, the Dogmatism of Wolf and the Sensualism (or sensuous system) of Locke. The gigantic mind of Kant had occupied itself with equal force and influence in the investigation of both systems. As public teacher of logic and metaphysics he was compelled to take Wolf as his text book; nevertheless he introduced into his lectures his own independent remarks, which threw doubts on several dogmatic doctrines of Leibnitz. On the other hand, in his work on Pure Reason, Kant started from the text-book of Locke, and had to defend inch by inch the elementary axioms of Dogmatism, which in his lec

tures, previously delivered, he had taken for granted. Kant thus found himself between the fires of the contending parties; and with what almost supernatural power of genius and grasp of thought he contrived to brave the perils of that emergency, it shall be our task to develop in the following pages.

Wolf found in the radical principles of reason the fundamental laws of the outward world, inasmuch as the relations of substance and accident, cause and effect, possibility, &c. form alike the elementary conditions of our reason, and of all that exists around us. Wolf therefore asserted that the only reality in an object was what fell within the scope of our perceptions; while the activity of our senses, or whatever forms the condition of our individuality, he considered as ACCIDENTS of the SUBSTANCES,—the general manifestations of our reason.

Kant, however, only admitted the first part of the axiom of Wolf, without granting the conclusion to be correct. Besides entertaining many doubts as to the necessity of the inference drawn by Wolf, he even suspected that it involved a contradiction, as our notions indicate possibilities rather than realities, and if Wolf's assertion, that individual existence is the accident of notions, were correct, it would follow that reality is the accident of possibility, a supposition absolutely absurd.

When Kant afterwards resolved to base, with Locke and Hume, his philosophy upon the ground of Experience, the case became entirely reversed. The *conclusion* of Wolf's assertion was easily established, while the *first* part fell to the ground. In this result Kant was most unwilling to acquiesce, and in escaping from it he was compelled to *prove* by argument that the fundamental laws in the outward world are identified with the primary perceptions of our reason; or in other words, that the elementary laws of the sensible sphere appertain, as essential attributes, to our reason.

The complicated labour of reconciling systems so extreme as those of Wolf and Hume involved him in difficulties on all points, and it is no marvel that the whole of his life was a continual devotion to one arduous task. Wolf derived all philosophic knowledge from pure reason, while Hume deduced it from the experience of the senses. Kant, in starting from Hume's system, undertook to demonstrate, *à posteriori*, all the axioms of Wolf.

Among the same axioms, that of the intelligible world,—or a world of *noumena* in opposition to the world of *phenomena*,—occupies a prominent place. This we shall now endeavour to illustrate.

Leibnitz, and with him Wolf, had maintained that man is a being living in two opposite spheres,—in a physical sphere known to him by the experience of his senses, and in a spiritual sphere known to him by the operations of his pure reason. Kant was upon the whole penetrated with the truth of this opinion. It formed in fact the very essence of his own philosophy, but he was compelled after all to urge many doubts against part of the assertion. He afterwards proved, in his Criticism on Pure Reason, under the head "*antinomies*," that there is nothing beyond the limits of Experience which can serve as a touch-stone for the correctness of our thoughts. Nor did he find in the knowledge which psychology affords us, with the aid of experience, sufficient evidence to substantiate the life of human nature in two distinct worlds. Being however MORALLY convinced of the truth of that assumption, Kant had recourse to the moral postulates to uphold and affirm it. He thus opposed to *empiric* consciousness one of a higher character. He confronted, if we may so say, the obstinate silence or apparent opposition of Sense with the direct affirmations of Spirit. Finding that outward nature, and even speculative thought, were unable to confirm him in a conception which haunted him as it were instinctively, he determined to accept it in all its vitality as the result of moral necessity. This implicit evidence in the declarations of conscience forces the soul to acknowledge her own will, and points out to her the means of avoiding scientific allurements. It demands of the soul that she shall give audience to no philosophy save that which is of an intuitive character, and never surrender the faculties to investigations solely in the field of sense; that by such discipline we may from time to time find it possible to divest ourselves of outward impressions and propensities.

Kant's philosophy, which has not only abolished all previous systems, but, as we before intimated, has interwoven itself with all subsequent theories, is distinguished by three reforms; in the method of knowledge, the deductions of belief, and the notions concerning the moral law.

The task of the subsequent modern systems, and more especially that of Hegel, the most fashionable of the day, consists merely in bridging over the immense chasm that exists between Kant's modern school and Wolf's ancient school; to the end that the old scholastic views might be transferred with greater facility and security to the new system.

The first reform of Kant was, we said, in

the Method of Knowledge. Before his time philosophy was withheld from assuming the rank of absolute science. Instead of keeping strictly to positive knowledge, she claimed it with respect to things of which she failed to prove even the existence. Thus in amalgamating perfect with imperfect knowledge, she became suspected of vain and speculative presumption, based on hypothesis alone. Kant, however, undertook to banish from the philosophic sphere all notions uninvested with the character of positive and demonstrative knowledge. He disposed, one by one, of those subjects of contention which had continually given rise to controversy, and which were involved in the opposition then believed to exist between Dogmatism and Scepticism. Before him the philosophers conceived themselves compelled to enlist under the banners of one of these. The dogmatists who reduced all philosophic knowledge to *one* principle, assuredly could not admit the opinions of the Sceptics, who doubted of the certainty and positiveness of philosophic knowledge in general : but the system of Kant, which drew a line of demarkation between positive and uncertain knowledge, easily reconciled both opinions.

The second subject of contention which Kant removed by his reform in the method of knowledge was, the opposition that existed between Intellectuality and Sensualism, or Sensuousness. According to Kant, all knowledge, though it begins its operations with sensual experience, nevertheless does not flow therefrom, since the facts themselves are conceived and properly arranged by innate and *à priori* perceptions, or categories of pure reason. But the particular exhibition of those facts depends upon the situation, position, and form of the sensual vessels which become recipient of innate contemplation.

By this method Kant proved himself the umpire between Sensuality and Intellect, and effected a lasting peace between the contending parties. Until his time, ever since that of Des Cartes, it had been the subject of bitter dispute, whether philosophical knowledge or conceptions were, as according to the sensualists, derived from pure experience, or, as according to the intellectualists, from pure reason. Kant has shown the fallacy of both opinions by demonstrating that all phenomenal knowledge must arise from the co-operation of the outward and the inward. An intellect that loses sight of experience, has no object on which to act. The objects which experience presents cannot truly be said to exist, until Intellect with its combin-

ing and arranging power commences its operations upon them.

The third subject of controversy which Kant disposed of by his reform in the method of philosophical knowledge, was the speculative theology in vogue from the scholastic times, and which had found an advocate even in Wolf. Here Kant did not attempt a reconciliation, but extirpated the very root of the evil. He it was who entirely annihilated that learned monster against which many other philosophers had previously contended with more zeal than success. Speculative theology deduces its doctrines concerning God, the creation of the world, the character of the soul and its future state, from notions of pure reason alone. This ridiculous system had infected even the matter-of-fact Locke, who, though starting from the principle that all knowledge is derived from experience, extended his categories of reason, drawn as he supposed from mere experience, far beyond the boundaries of all experience, and concocted arbitrary postulates with regard to eternal matter, creation, and the Deity. Kant however terminated the phantasy ; and this leads us at once to the second reform, which he wrought in Belief.

The subjects of belief or faith, viz. God and immortality, are far beyond the reach of human knowledge. Belief does not rest on any soil of knowledge or perception, but solely on moral resolution of a peculiar character. Belief is always and necessarily associated with a change in mental disposition. Nay it is even identified with that psychical tendency which attracts man from his earthly exertions, and worldly interests, to the serious accomplishment of the moral law. With the disappearance of that tendency, belief vanishes also, and with the return of the mental disposition, belief also returns. He who perseveres in the fulfilment of the moral law is a believer, since belief is none other than the operation of that law. The identity between a necessary direction of the will by the moral law on the one hand, and belief on the other, may be illustrated in the following simple manner.

The moral law, which commands us to act uprightly, and which is inherent in every human being, requires implicit and unexceptionable submission. Man will find no difficulty in obedience, if he associates with it the idea of utility, and sees that compliance with that law is conducive to welfare, honour, or fortune ; inward or outward comfort ; internal or external perfection. For virtue and happiness are ideas which bear

the relation of cause and effect to each other in the innate judgment of our practical reason. Thus, whenever the moral law is apprehended as the source of happiness, there is little difficulty in obedience to the former. The connection, however, between virtue and happiness is not always perceived to exist: on the contrary, there are cases in which actions that seem to deserve the highest reward, yet apparently conduce only to misery, or even death. In such instances the moral commandment frequently appears absurd, and he who resolves implicitly to obey it, is considered by the multitude little better than insane. With many the acknowledgment of the moral law is limited by the beneficial consequences which result from it in the outward world. Such a state will never cease while we expect as the reward of obedience to the moral law the generation of circumstances externally favourable. That law proposes no recompense during the period of trial. It does not contemplate man as a mere mimic warrior whose battle with Circumstance is to be fought by other agency than his own. He is not destined to combat by proxy, and to be rewarded in person; but Conscience is to animate him, Hope to sustain him, Immortality to repay him. It is in the appreciation of these truths—in the realization of the “hereafter world” that he finds it easy to render to the moral law that conformity which under other circumstances is impossible.

The belief in God and immortality is thus transformed by Kant from a matter of demonstration into a matter of moral resolution. The system of Kant, therefore, more than any other, approximates in this particular to positive religion; which, commanding us to believe even without seeing, could never allow attempts at metaphysical demonstration to supply the place of moral resolution. The system of Kant with regard to religion has also a close connection with the primitive patriarchal faith, which was characterized by personal communion with God. Kant in this particular stands almost alone; the great body of modern creeds having substituted communion with the symbols of Deity for personal intercourse with himself.

The third reform which Kant wrought was in relation to the Moral Law. The teachers of moral philosophy before him had asserted with some plausibility that much might be done in the field of morals by the principles of desire of good, pursuit of perfection, and social comfort; all of which were deduced from Experience. Kant, in endeavouring to establish morality as an ab-

stract object beyond the reach of motives drawn from Experience, announced the requisition of the law in the following terms: “Act as if you would have your conduct the standard for that of *all men*.”

Moral law must not, however, be confounded with moral instinct or moral sense, because the active power of the first is associated with moral dignity, and prohibits our inclinations from testing the value of our actions. Kant duly felt the value of distinguishing rational judgment from desire, enthusiasm, aversion and fear. He therefore properly designated his task as “a chemical process of decomposition.” By the simple process of applying our individual instinct to the state of Society at large, the alloy of that instinct is dissolved, and naught remains of it save what accords with the moral law.

In entering deeply into the spirit of Kant’s system, involving as it does a machinery extensive and complicated as it is profound and ingenious, we cannot restrain the exclamation, “Here is indeed a new Socrates!” Kant, like Socrates, gave to philosophy the value and certainty of a practical character—Kant, like Socrates, waged war against sophistry, and abolished the metaphysical illusions of his time—Kant, like Socrates, effected a perfect revolution in the field of thought, opposed the simple to the artificial, and positive realities to far-fetched speculations—Kant, like Socrates, won philosophy from the clouds to the earth, from the standard of theoretical investigation to that of practical belief—like Socrates he was hostile to Rhetoric, as calculated to allure and mislead, though he himself was a master in the art of connecting and analysing logical subtleties. There is, however, another similarity between these great men. Neither of them pretended to form a new school by a complete system of their own. Both of them, on the contrary, declared explicitly to the last, that their philosophies were progressive in point of theory, and at a great distance from perfection. On the other hand, both declared the practical certainty of the law respecting all that is good, and the connection that exists between the soul and Deity to be dogmatically true. Kant considered his Criticism on Pure Reason as a mere preliminary study to a future system of metaphysics; nor did Socrates disdain to resume investigation in every new dialogue, for the purpose of ascertaining whether another way leading to the Supreme Being might not be discovered. The lives of both Kant and Socrates were devoted to the analysis of all previous systems; Socrates examined those of Parmenides, Zeno, Heracles, and

the sophists; while Kant put to the test of criticism those of Leibnitz, Wolf, Locke, Hume, and the French philosophers of the last century, at the head of whom was Voltaire. Kant would hardly have been stimulated to the profound and spirited defence of his own system by those doctrines of Wolf which the philosopher of pure reason had once taught in his capacity of public professor.

But he was assailed by a hundred different and conflicting voices. The German, like the Greek, was destined to contend with the subtle theorists of the time. Helvetius, Condillac, La Mettrie, Maupertuis, Robinet, and Rousseau, formed the band of modern sophists whom Kant had to encounter. There is indeed so striking a similarity between the situation, plan, purpose, and doctrine of the two great men whose characters we have compared, that we are induced to elucidate a little more fully the history of philosophy.

Until Socrates the ancient philosophers were constantly engaged in attempts to separate the conception of a thing from the thing itself; to form as the result of their system an abstract mode of thought, and to elevate mankind from the kingdom of sensuous phenomena into that of unmixed idealism. This process, which appears so easy to us moderns, was found difficult of accomplishment in the time to which we refer; so much so, that it was reserved for the powerful genius of Aristotle alone to consolidate and arrange systematically the common laws essential to abstract thought, judgment and inference. Simple logical conclusions which are with us so lucid as to be in the mouths of children, wore in ancient times the appearance of enigma and paradox. Thus we at present find no contradiction in the assertion, "that although all negroes are men, yet all men are not negroes;" anciently, however, when the mathematical equations were more known than the logical, the preceding assertion was comprehended in the sense of a mathematical equation, and the result was, since $\text{Negro} = \text{Man}$, it necessarily followed $\text{Man} = \text{Negro}$.

The foregoing proposition, and others of a similar character, were considered in the time of Socrates much in the same manner as we now regard the antinomies and paralogisms contained in Kant's doctrine of pure reason at the present day. Such a theory as his, which supposes familiarity with at least the laws of abstraction, was utterly impossible in ancient times when logic was yet in its infancy. We may therefore refrain from wondering that Socrates had devised no measures for limiting the use of abstract

notions in connection with all that is divine, and that he on the contrary much recommended their free use; a line of conduct greatly deprecated by Kant. Socrates, and after him Plato, had, however, too much scientific intuition to be misled by the liberty which they allowed to others.

With regard to the practical part of their philosophy there is this difference between Socrates and Kant, that the former as a teacher of unprecedented moral doctrines was compelled to explain and illustrate them by his own actions, both public and private; while Kant had nothing to do but direct public attention to that law, for obedience to which a thousand martyrs had perished. The Greeks were a young people, principally characterized by their emulative spirit. Their Olympic games were typical of their uniform disposition. The continuance of their best citizens in the paths of sobriety, moderation and justice, was rather the result of competition than of any higher motive. Thus with their philosophical theories, gymnastic exercises were introduced in the public arena, and made the theme of public discussion. The ancient philosopher was obliged in a great measure to elucidate his creed by his life; but in our own days, in consequence of the general development of perception, mental doctrines need no sensuous interpretation; and theories which effect the greatest mutations in society may owe their parentage to men who never leave the quiet of the cell or the seclusion of the hermitage for personal intercourse with mankind.

We may anticipate that Kant's philosophy will exercise on the future development of science, an influence analogous to that exerted by Socrates at an earlier period. The fruit it has already borne during the brief interval which has elapsed since his death justifies us in this expectation. As in the days of antiquity Socrates brought forward a system entirely novel for the development of ideas, and one which nevertheless revived in some degree the preceding doctrines of Parmenides, Pythagoras, Heracles, and Democritus, so did the theory of Kant, though in itself perfectly original, re-introduce to mankind the doctrines of Spinoza, Leibnitz, Plato, and Jacob Böhme. Indeed it is the noble prerogative of genius to discern the truth that exists in all creeds, how much soever they may differ from each other. The wise architect does not reject the Doric order or the Ionic order in favour of the Corinthian, but he finds in each class an adaptation to a particular portion of the edifice. The fragmentary and diverse specimens of the various philosophic orders Kant has combined to-

gether with the judgment of a sage, and with the taste of an artist ; and has constructed for us a mental temple accordant with the simple but imposing solemnity of feelings inherent in the breasts of devout and earnest worshippers.

The theory of Leibnitz as to a supernatural intellectual world has been embodied in Kant's system, as that state of reason wherein we spiritually live, while as physical beings we belong to the realms of space and time. This theory is moreover recognized by Hegel, who asserts "that the kingdom of God is realized in the history of the world."

The spirit of Spinoza is exhibited by Kant, who laboured to found a strict metaphysical system upon pure notions ; and he may in this respect be associated with Schelling, who considered the various appearances of nature as so many different aspects of mental perception.

The attempt of Locke to bring the imagination under the control of experience is, in so far as valuable, wrought out successfully by Kant, who separated and distinguished the elements of knowledge into classes material and spiritual. This doctrine is indicated in the Psychology of Herbart and Benek, which subjects the attractive and repulsive powers of the imagination to a demonstrative ordeal.

The dialectics of Plato, which treat with wonderful ingenuity of the contradictions and labyrinths in the ideal world, are reflected in Kant's doctrine of the Antinomies and Paralogisms ; wherein he shows how blind and powerless is reason out of her proper sphere. As to this, Kant's influence may be traced in the attempt of Hegel to reconcile the difficulties contained in the Antinomies, and in the endeavour of Herbart to correct them.

The construction of nature by Des Cartes, who said "give me extension and motion, and I will create nature," is represented in Kant as a physical DYNAMIC from the attractive and repulsive powers, and is assented to in the philosophy of Oken, who proves the act of self-consciousness to be the same in the simple form of the atom, and in the organization of the thinking brain.

The doctrines of Grotius and Hobbes Kant involves in his idea of natural right, which he has developed in theories of state economy, and which men like Hegel and Krause held to be superior even to the ideal of Plato's Republic.

The theological rationalism originated by Abelard, and which transfers faith from the realm of external authority into that of man's inward conscience, Kant described as a religion within the limits of pure reason, where faith is generated by the vivid operation of

our feelings and sympathies. This doctrine has found an able and successful advocate in Schleiermacher.

The philosophy of the present day resembles a vast edifice, which as an entirety is beyond the comprehension of the beholder. Most of our modern thinkers are familiar with but one wing or section. It was for Kant to sketch the plan of the whole building. Every one after him has chosen a certain department ; one the categories, another the *à priori* views, a third the investigation of objects, and a fourth the absolute subject. Thus the general survey has been gradually lost. The knowledge of modern philosophers is profound and rich in experience, but at the same time limited and partial ; that of Kant, on the other hand, though abstract and poor in experience, was nevertheless all-embracing and ideally distinct. It is impossible at the present time to be a thorough adept in philosophy, without becoming familiar with those principles which are developed in Kant's Criticism on Pure Reason. On the other hand, no sooner have we mastered that criticism than we discern in every page the seeds of all systems now in vogue amongst mankind. We are, however, apt to prefer the harvest to the seed, and thus forgetting that they but reap what Kant sowed, the modern schools have actually sneered at the imperfect state of his speculations. Fichte is the only man who has acknowledged his system to be a branch of Kant's. It was customary in the school of Schelling to look contemptuously on the philosopher of Königsberg, while the disciples of Hegel held the Criticism on Reason to be the emanation of an inferior mind. There is, however, some excuse for their severity. The fault chiefly rests with those pedantic blockheads who, adhering to Kant's system, and calling their school very improperly the Kantian, did not advance a single step beyond their prototype, although he himself more than once declared that his system was far from being complete. Thus it happened that the thinking disciples of Kant, who advanced with wonderful rapidity in the road pointed out to them by the latter, found it better to disown his name altogether than to bear it in connection with those imbecile travellers who could not proceed a step beyond the spot to which they were led.

In analyzing the wonderful features peculiar to Kant's philosophy we are primarily struck by the elevated and ennobling feelings which it awakens. In looking to the moral law as that which is to govern our conduct, and as the source whence we are to receive all communications of *à priori* science, we become aware of the dignity of human cha-

acter, and of the glory of our ultimate destiny. The development of laws in the region of spirit becomes to us as familiar as their illustration in the world of matter. We ascend to the eminence of a moral observatory; the human soul is the firmament which we scan, and the immortal faculties are those worlds of which we calculate the position, the ascendancy, and the eclipse.

We are led, in the second place, to perceive that the universal law which reigns throughout the spiritual and material worlds is neither of a physical nor an intellectual, but of a moral character.

Thirdly, we are induced to acknowledge that the most valuable features of ancient philosophy have been retained in the system of Kant, and that he has superadded to them those higher qualities and forms of illustration wherewith Christianity has been endowed by its author.

But that which demands our most particular attention and admiration is, the universality of that mind which found something akin to itself in all former systems, how much soever at variance with each other; which having collected together the currency of previous thoughts, and upon which the stamp of greater principles was but partially visible, refined them together in the furnace of virtuous intelligence, amalgamated them into harmonious unity, and sealed their homogeneity with the indelible impression of truth.

3. *The Chinese Repository.* July, 1836; January and March, 1837.*

NATIONS in the early stages of civilisation are like children in their infancy. They have to undergo a course of instruction in order to render them in after years worthy members of society. We take it for granted that it is no more possible for a nation than for an individual to remain perfectly inde-

pendent of others, unless in a state of comparative barbarism. All advancement in knowledge and power, both in the one case and the other, is made by frequent communication and mutual assistance.

The rules of conduct which ought to regulate the intercourse of nations are by no means fixed and invariable, but should be based upon principles of equity, which are supposed to be well understood in all polished countries. Among uncultivated people, however, the case is different. They neither appreciate the advantages to be derived from a friendly intercourse with other nations, or can be made to understand the relative position in which they are placed. It becomes therefore a matter of great importance that sufficient instruction should be imparted to overcome these impediments, and establish some maxims on which a system of legislation may be founded.

In the education of our children we know that the system of excessive corporal punishment has been proved to have a most pernicious tendency, and is now almost entirely done away with. Experience teaches us that much more is effected towards the improvement of morals by practical illustration and example, than by ten thousand theories and precepts assisted by the cane and birch. In the education of nations, on the contrary, if we search the records of history, we find the melancholy truth, that in the progress of civilisation scarcely any advance has been made by just and peaceable expedients. Wherever it has been attempted to disseminate among semi-barbarous tribes the enlightened notions which distinguish the people of our part of the world, lamentable failures have ensued unless they have been backed by some means of coercion or intimidation. Are we then to conclude that a milder course would never be effectual? that man is by nature so depraved, so blind and vitiated, as to require force to compel him to attend to his own interests? Or is he in manhood more insusceptible to truth, when set forth by fair reasoning and virtuous examples, than in the period of childhood? We firmly believe not.

Let us cast the veil of charity over the motives and proceedings of our ancestors who discovered foreign parts of the globe. It is not our intention in this place to point out or dwell upon the course which they thought proper to pursue in the intercourse with the natives of those places. Opinions happily are now changed, and those measures which were formerly applauded would not at the present day be even tolerated. The views of mankind are becoming much more enlightened. A larger field of vision

* The Iniquities of the Opium Trade with China; being a Development of the main Causes which exclude the Merchants of Great Britain from the Advantages of an unrestricted commercial Intercourse with that vast Empire. With Extracts from authentic Documents. By the Reverend A. S. Thelwall, M. A. Drawn up at the request of several Gentlemen connected with the East India Trade. London: Allen and Co. 1839.

is exposed, making narrow and selfish feeling give way to broad and universal principles of moral rectitude. Without being suspected of flattering the times in which we live, we may affirm, that in the present philosophical age, when all our actions and even our thoughts are referred to a standard of humanity, no political or commercial advantages should be sought at the expense of either the morality or the welfare of the human race. It is, we feel persuaded, quite practicable to reconcile our individual interests with the general good, and therefore no temptation should induce us to be allured by the one whenever it clashes with the other.

The state of our relations with China furnishes an ample field for reflection. Here we have an instance of a people, estimated at more than three hundred millions, and constituting the largest family of the human race ever known to exist, refusing all intercourse with the rest of mankind. They have long arrived at the highest state of civilisation that under such circumstances they could possibly attain. For centuries they have remained stationary, and so would they continue for centuries to come, unless they received an impetus from a more advanced people. Even were the latter only on the same level as themselves, the very contact would be serviceable, as rough pebbles become polished by rubbing against each other.

Many generations have passed away since China has been known to Europeans, and yet it is surprising what a little advance has been made towards overcoming their prejudices. We have made but little progress in our connection with them beyond our mere commercial relations; and though our majestic Indiancers are constantly passing and repassing between the shores, freighted with the richest stores of both countries; though there has long been a yearly interchange of commodities, the produce of each other's industry, yet we are virtually as much strangers to each other as ever. This cannot be altogether the fault of the Chinese.

China has ever been a bone of contention with the different powers of Europe. As if the title given to it by its inhabitants were allowed to be just, and it were really considered the *Celestial Empire*, by the more civilized people of the West, it has always been sought after with an extraordinary degree of zeal and perseverance. The extent of the dominions of the "Son of Heaven," the number of his subjects, or the riches of both nature and art, over which he has the sway, have probably scarcely ever been exaggerated. The advantages likely to re-

sult from an amicable alliance with so great a power, are not, therefore, few or unimportant, and accordingly the greatest efforts have been made to secure them. A commercial treaty more particularly has been desired, on a firm and equitable basis, in order to make the wealth of this great country available to other states. It remains to be seen to what causes we are to attribute the present ill success, and whether it may not be traced altogether to short-sighted policy and mismanagement.

On the other hand it deserves attentive consideration to determine the peculiar views and opinions of that singular people; and the readiest and most equitable method of conciliating their confidence and esteem.

No compulsory measures have been hitherto deemed advisable, and at the present day it is doubtful whether they would be expedient. For, notwithstanding the unwarlike character of the Chinese, and the easy prey they appear to present to the hand of power, they have not of late been molested, or their territories invaded by any foreign armed force. It would be absurd to attribute this forbearance to a reluctance to invade the rights of others, as the grasping system has been long adopted in regard to weaker nations; nor is it our intention to investigate, at this moment, the different reasons which might be assigned. Certain it is that there has been every inclination for such an enterprise, but strong as was the temptation, it has been over-ruled by motives of prudence. It has probably been reasoned, and we should think with propriety, that the project might not turn out so successful as had been anticipated—that the Chinese, although unwarlike, were not deficient in courage; and if properly trained and goaded on by injuries would make good soldiers. But we believe that another principal reason why an armed interference has not been resorted to of late years is, that a sufficient pretext has not been afforded. The authorities there have acted with sufficient prudence in all their dealings with foreign merchants; so that however vexatious may have been their restrictions and annoying their language to the individual parties, they have always appeared trivial and unimportant to the governments at home, and unworthy of serious notice.

It now becomes necessary to analyze in some degree the national peculiarities and prejudices of the people of whom we are speaking, as affording the readiest means of judging of the line of conduct which should be adopted. Among the different characteristics of the Chinese, the most prominent and the most difficult to be man-

aged is their national vanity. They certainly may be considered the most self-sufficient people on the face of the globe. From the time of Confucius downwards they have ranked all foreigners as barbarians, infinitely inferior to themselves. By the modern Christian legislation, the theory of the natural equality of mankind is advocated; but this is absolutely denied by the Chinese. Not only do they consider strangers as inferior to themselves, but as absolutely of another race. They look upon them as enemies, and frame laws for them accordingly. The tenour of all the Canton edicts sufficiently shows that this idea is acted upon, and that it is, therefore, deemed traitorous for any of the natives to hold more than the allowed communion with these inhabitants, as they term them, of "kwei-fang, or regions of the devil."

Much as we may be tempted to feel provoked by these absurd pretensions, feeling as we sufficiently do our acknowledged rank in the scale of nations, we ought to bear patiently with folly of this kind, when we recollect that others of still greater fame than the Chinese have entertained the same weakness. Among the enlightened Greeks and Romans the same word, 'hostis,' employed to designate a stranger, also signified an enemy; we have abundant testimony to prove that these words were synonymous. Aristotle, one of the most celebrated of Grecian philosophers, asserted, that "strangers were slaves by nature, might be considered beasts of chase, and fairly hunted down." Of all wars, he thought, with his ancestors, "that those wars were most just and necessary which were made by men against wild beasts: and next to them those which were made by the Greeks against strangers; who," adds the philosopher, "are naturally our enemies, and for whom we are perpetually laying snares."

The same author also says, "that one of the most striking laws of the Romans is that by which, instead of considering every man as a fellow creature, between whom and themselves there was an implied alliance, he was deemed a being to whom they were absolutely indifferent, and with whom there was hardly any more connection than with the beasts of the earth."* The Mussulman also is not backward in terms of opprobrium, and it signifies little by what term the inferiority is designated, whether of *Christian dog*, *Greek Barbaroi*, or *Chinese red-bristled devil*, but the same inferiority is asserted. This prejudice is doubtless founded upon ignorance, and however much we may

deplore its existence in others, we have no reason to congratulate ourselves upon our total exemption from its influence. It certainly argues no great superabundance of liberality on our part, when such terms as "snubnosed savage," "petticoated, long-nailed, tuft-bearing barbarians" appear in our leading journals applied to the emperor and people of China.

Another leading feature, and the only one which at present we deem necessary to mention, and which grows out of the prejudices before alluded to, is the domineering insolence which causes the Chinese constantly to attempt imposition. This is the more annoying as it is always accompanied with symptoms of great pusillanimity whenever a proper degree of firmness is opposed to it. This mixture of assumption and impertinency, of swagger and cowardice, is extremely contemptible, and draws largely upon the patience of those who have any dealing with them and are of a different temperament.

These two leading points of character being fairly established, the line of conduct which should be pursued in all our intercourse with the Chinese must be evident. On the one hand, we should endeavour to elevate our character as much as possible in their eyes by a course of upright, independent, and conciliatory behaviour, to gain their esteem: on the other, we should force respect by extreme firmness and a steadfast determination never to submit to the slightest indignity. By these means we should overcome rapidly their prejudices, and quickly stand on a much better footing. Has the conduct of foreigners always been in accordance with these principles? most certainly not: but when it has, the most beneficial effects have been apparent.

In the annals of the Chinese, we find the earliest accounts of foreigners recorded in the histories of pirates, or contained as useful information in the lists of tributaries to the empire. This is to be accounted for from the fact that in the earliest periods of intercourse, the right of conquest was sanctified by the church. All pagan nations were considered fair prey, and that it was not only justifiable but even meritorious to oppress and plunder them. Adventurers of all countries behaved in the most reckless manner in all parts of Eastern Asia, and being far away from any control from their governments at home, and guided alone by their own grasping and violent propensities, they insulted and ill-treated the natives at their pleasure. As the Chinese have, from their own experience, a salutary dread of pirates, they naturally ranked these strangers among the number,

* Ward, vol. ii. p. 173.

and tried by every means in their power to keep them from their shores.

When it was found that the nations were too united and the government too powerful to allow the system of depredation to be successful, attempts were made by the different states to monopolize the trade with China. For this purpose each endeavoured to degrade the character of his rivals in the eyes of the authorities; and thus in turn the Dutchman, the Portuguese, the Englishman, the Spaniard, and the Dane, was traduced, and all the enormities committed by desperadoes on the coast laid to his charge. Each nation was represented by its competitor as composed of outlaws and vagabonds, with whom no mercantile transactions could be conducted with honour or safety. Thus the earliest intercourse of foreigners with the Chinese was not of a very dignified character, or calculated to do away with the distrust previously entertained. They had their prejudices confirmed, and naturally looked upon all strangers in the same light. They could not but regard them as enemies who were attracted so far from their homes in hopes of plunder.

It was the same with those Europeans who some time back attempted to diffuse Christianity among the Chinese. The success of the Jesuits was complete. They gained the confidence of the Emperor, and obtained many proselytes to their faith, until jealousy of their progress induced the Pope to send monks of other orders to the same station. Constant misunderstanding and bickerings ensued, followed by recrimination and abuse, which ended by producing a most disadvantageous impression of the whole crew, and their expulsion from the country. It is unnecessary to trace further the causes of distrust and ill-feeling on the part of the Chinese in the earlier periods. It has been sufficiently shown that the ill opinions entertained were not altogether unfounded, and that the prejudices of a thousand years were not to be eradicated by such conduct.

At later periods considerable advancement has been made in conciliating the better feelings of the Chinese. The illusions of tradition have been in some measure dissipated, and even a portion of respect has been wrung from them. The English have enjoyed this advantage in a much greater degree than any other people, and this is entirely to be attributed to the upright and honourable manner in which all the intercourse was conducted under the management of the East India Company. We do not mean to assert that at that time the most independent and determined line of conduct was always adopted on our part, or such as was likely to impress

upon the minds of the natives an idea of a powerful nation. On the contrary there was frequently shown a great deal of vacillation of purpose, by which the Chinese habits of imposition and extortion were strengthened; and the frequent threats held out but never fulfilled, must have conveyed an unfavourable impression of our courage and resources.

For our part we confess that a perusal of the Company's transactions in China reminds us of a scene of constant occurrence in the metropolis, of a purchase made in the shop of a Jew, who is in the habit of asking for his goods a much larger sum than he will take. At first the customer is indignant at the attempted imposition, and walks away with the determination of leaving the place. He scarcely gets outside the door, however, before he is recalled by the Israelite, who offers to lower in some degree his demand. This does not please, and the bargain is refused. The Jew persists, and the customer departs; but before he reaches the street the tradesman again calls him back, and agrees to reduce the price to the proper value of the article. The purchaser now thinks that by showing unconcern, as if he were not in real want of the goods, the crafty shopkeeper will give way still further, and therefore once more quits the premises. But in this he is mistaken. He is no more solicited to return; and is therefore obliged to go back, and, looking foolish enough, make the best bargain he can; thus giving encouragement to the son of Levi to impose upon him in future. In this light we are tempted to regard the frequent orders of the supercargoes for the ships to move down the Canton river; their subsequent recall; threats of breaking off the trade altogether, and final submission to extortion.

But notwithstanding the vexations to which they were occasionally obliged to submit, the English, in the time of the East India Company, made considerable advances towards conciliating, as we have said, the good opinion of the Chinese. On this account they enjoyed certain privileges, which, although of no great importance, were not conceded to any other nation. Many disagreeable ceremonies were dispensed with, and more particularly the supercargoes of vessels under the British flag were exempted from swearing that there was no opium on board, while all other ships were forbidden to enter the river until such oath had been taken. A degree of confidence was also evinced in their mercantile dealings, and which was the more surprising when we consider the suspicious character of the natives. The manner of arranging the prices to be given for the teas deserves to be mentioned. The mus-

ters were subjected to the examination of the Company's tea-inspectors, when, upon their report of its superiority or inferiority to the standard quality agreed upon, the teas were valued at a higher or a lower price. In this business of valuation, the hong-merchants took no part, and scarcely ever objected to the decision.

These beneficial effects must be attributed entirely to the honourable and liberal manner in which all the transactions were conducted. The Chinese really entertained a great degree of respect for the members of the Select Committee, and relied implicitly on their word. Some of the principle obstacles to an open and unrestricted intercourse were thus overthrown, and it is probable the success might have been complete if the system, with some modification, had been pursued for a longer period. The Select Committee found that a steady perseverance in open and upright conduct was the only way to overcome prejudices. As the Chinese utterly deny the equality of independent nations, and even the natural equality of mankind, a few essential principles of universal equity are the only laws in which they would acquiesce, and the only ones to be appealed to by foreigners. The exact state of our political and commercial relations with China at the period of the expiration of the charter of the East India Company should be well considered, in order to judge fairly of the occurrences which have since taken place, and their probable effects on our intercourse; whether the prospect of a good understanding has been brightened or obscured.

This brings us to the opium trade, a question which now engages a considerable portion of public attention, and properly, as it is become of enormous magnitude, and has such peculiar features, and such an influence on all the affairs of the East, that the whole of its bearings are deserving of the strictest scrutiny. The politician, the merchant, the divine, the moralist, and the philanthropist, will find in its investigation an object for the gravest meditation. Its final settlement may now be speedily expected, as it has become a national affair, and is no longer confined to a few individuals in a distant part of the world. Recent events have displayed a crisis which has been long predicted by those who may be supposed most acquainted with Asiatic affairs. Many residents at Canton have foreseen these occurrences, and most of the late writers on China have attended to the subject.

Whether we regard the capital employed or the countless millions of people concerned in the traffic, it is evidently a question of the greatest importance. For our parts, our

opinion has been long made up. We do not hesitate to pronounce the opium trade on the coast of China one of the most abominable and mischievous systems now in existence, and reflecting the greatest dishonour on the British flag. Before we proceed to prove this position, it will be necessary to give an outline of the way in which the traffic is usually carried on, as it may be presumed that the particulars are not familiar to many of our readers. Attention until lately has not been called to it, so that its progress has been watched by scarcely any but those personally interested.

The opium trade, now under consideration, is that carried on between the British possessions in India and the Chinese empire. For although some portion is imported from Turkey, and the poppy is cultivated in some provinces of China itself, yet this is of very inferior importance, the opium supplied from these sources being inconsiderable in quantity. The trade has risen into importance altogether of late years, and has increased to a most surprising extent. An instance of such rapid augmentation of a single branch of commerce is hardly on record. Some years back, about the time of the embassy of Lord Macartney, scarcely any mention is made of it, as opium was then used merely as a medicine. Afterwards it was employed as a luxury, and from that time the consumption rapidly increased. "In 1816, 1817, twenty-two years back, 3,210 chests of the Indian opium were imported. In 1826-7, it had increased to 9,969; in 1832-3, to 23,670: and lastly, in the season 1836-7, no fewer than 34,000 chests were brought by the clippers."* The following statement of the Rev. W. H. Medhurst exhibits the consumption of opium during the last twenty years:—

1816, chests 3,210, value 3,657,000 dollars.	
1820 . . . 4,770 . . . 8,400,000	
1825 . . . 9,621 . . . 7,608,205	
1830 . . . 18,760 . . . 12,900,031	
1832 . . . 23,670 . . . 15,338,160	
1836 . . . 27,111 . . . 17,904,248.	

The quantity introduced during the year ending in the spring of 1837 was 34,000 chests, and the deliveries during the month of July of the same year amounted to 4,000 chests.*

In order to convey to the reader some idea of the quantity consumed yearly by the Chinese from this source, it may be mentioned, that although the weight of a chest of opium varies, the Malwa usually averages about 134lbs per chest, and the Patna 116lbs. Taking, therefore, 120lbs as the

* Fan-qui in China, vol. iii. p. 163.

† China—Its State and Prospects, p. 85.

average of the whole, the quantity contained in 34,000 chests would amount to 4,080,000 lbs.

The chief places where the poppy is cultivated in India for the manufacture of opium are at Malwa, Benares, and Behar. One half of the Indian drug is grown at Malwa, and there the cultivation of the plant and the trade in opium are free, as the management of the soil is beyond the authority of the company, although the chiefs are under British protection. Nearly the whole of this portion goes to Bombay, where it is shipped for China. At Behar and Benares, on the contrary, and indeed throughout the territories under the jurisdiction of the East India Company, the cultivation of the poppy, the preparation of the drug, and the traffic in it until it is brought to Calcutta, are under a strict monopoly.

In these districts the ryot or farmer is frequently compelled to cultivate the poppy at a fixed rate, and should it be discovered that he does this clandestinely, and without having entered into such an engagement with the government, his property would be immediately attached, or he would be obliged to give securities for the faithful delivery of the product. A system of most oppressive espionage is at the same time established for the purpose of preventing the traffic in the slightest portion of this valuable drug. At certain seasons the Company's godowns are opened at Calcutta; and the sales of opium effected. Great numbers of the residents purchase for the sake of speculation, as the price continually varies in China. Such a wakeful eye is kept over the drug that it is scarcely possible to purchase a single pound at Calcutta from any other than the agents of the government.

From Mr. Montgomery Martyn's "Statistics of the Colonies of the British Empire," a notion can be obtained of the revenue derived by the Indian government from the monopoly in opium. From this it appears that "in the season

	Chests.	Sicca Rupees.
ending 1800, they sold	4,054	for 3,142,591
1810 . . .	4,561	8,070,955
1820 . . .	4,006	8,255,603
1830 . . .	8,778	11,255,767
1835 . . .	12,977	13,215,464
1837 . . .	16,916	25,395,300

Estimating the value of the sicca rupee at 2s. sterling, the opium sold in the season of 1837 would amount to £2,539,530."*

When the sales have been effected at Bombay and Calcutta, the opium is shipped on board vessels expressly fitted for the

trade, which proceed immediately to China. They are called *clippers*, are remarkably handsome, well-built ships, and possess superior sailing qualities. Arrived on the coast, they deliver their cargo into a class of vessels called *receiving ships*, which are always anchored at the station of Lintin, or the adjacent anchorages of Capsingmoon or Cumsingmoon, situated without the Bocca Tigris, at the mouth of the Canton river.

As the importation is expressly forbidden by the Chinese government, it has now to be smuggled clandestinely into the country. For this purpose native smuggling boats are employed, which are well manned and armed. Orders from Canton are given to them, with which they proceed to the receiving ships, and the opium is delivered to their charge. It is taken out of the chests, examined, and removed after being packed in convenient parcels, ready to be easily carried off in case of pursuit. Collision with the authorities rarely takes place, as fees are regularly paid for connivance to the officers of the imperial preventive squadron. Indeed, it is not unfrequent for the custom-house officers themselves to be engaged in the smuggling trade, and government boats have been observed taking in a cargo of opium in the open face of day. This is the usual way in which the importation is effected, but some portion is also taken up to Whanpan occasionally, and a certain number of chests is disposed of along the coast to the northward.

When arrived at the provincial city, the opium passes into the hands of native brokers or *melters*, who subject it to a process by which the crude article is reduced to a watery extract. The Chinese designate the varieties of Indian opium by the names of *black earth*, *white skin*, and *red skin*, which severally fetch about 800, 600 and 400 dollars a chest. The quality which they prize in these samples may be gathered from a paper by Dr. Butler, "On the Preparation of opium for the Chinese Market," published in the Journal of the Asiatic Society of Bengal, in March, 1836. "The great object of the Bengal opium agencies is to furnish an article suitable to the peculiar tastes of the population of China, who value any sample of opium in direct proportion to the quantity of hot-drawn watery extract obtainable from it, and to the purity and strength of the flavour of that extract when dried and smoked through a pipe. The aim, therefore, of the agencies should be to prepare their opium so that it may retain as much as possible its native sensible qualities, and its solubility in hot water. Upon these points depend

* Book iv. p. 360.

the virtually higher price that Benares opium brings in the China market, and the lower prices of Behar, Malwa, and Turkey opium. Of the last of these, equal (Chinese) values contain larger quantities of the narcotic principles of opium, but are from their greater spissitude, and the less careful preparation of the Behar and Malwa, incapable of yielding extracts in equal quantity and perfection of flavour with the Benares."

From calculations made by foreign residents in China, and published in the Chinese Repository in the year 1836, it appears that if 34,000 chests of opium are imported, they would yield 33,320,000 taëls, nearly equivalent to an ounce weight of smokeable extract. By allowing one taël to each person for daily consumption, the number of smokers supplied by this quantity of the drug would be 912,000. But it is evident from statements which subsequently appeared from other parties, that a mace, nearly equal to a drachm weight of the extract, would be an ample allowance for daily consumption. When we consider also that the same portion is two or three times ignited, that the extract which in its fresh state served the luxurious mandarin one day, supplies the pipe of an inferior the next, and that even the dregs and dirt of the pipe are greedily devoured by the menial, the number of consumers is greatly increased, and may fairly be estimated at more than two millions.

Notwithstanding the opinion which now almost universally prevails in Europe as to the deleterious effects of opium, except when used medicinally, there are not wanting some few who maintain that it is a pleasing and gratifying luxury, which may be indulged in without injury to health. They say that any one who is at all acquainted with the manners and habits of the East must know that it is an indispensable stimulant to the Chinese—that it would be as absurd to deny them the drug as an Englishman his beer and spirits. As these notions may have been formed from want of knowledge of the subject, and we should hope that their promulgation arose from no interested feeling, we hasten to lay before our readers a few particulars.

It is allowed that the effects of opium are the same whether swallowed in a solid or liquid state, or smoked through a pipe. The latter plan is usually practised by the Chinese, and no doubt would be pernicious even if used with moderation. But we will venture to say that this scarcely ever occurs. The pleasure is so great or the infatuation so strong that it cannot be resisted, and the drunkard is the victim of his folly.

The words of a great poet, now no more, on this subject will be recollected. They occur in a letter written to an intimate friend, while he was still a slave to the "accursed habit" into which "he was seduced ignorantly." "For ten years," he says, "the anguish of my spirit has been indescribable. Conceive a poor miserable wretch, who for many years has been attempting to beat off pain by a constant recurrence to the vice that reproduces it. Conceive a spirit in hell employed in tracing out for others, the road to that heaven from which his crimes exclude him. In short, conceive whatever is most wretched, helpless, hopeless, and you will form as tolerable a notion of my state as it is possible for a good man to have. *In the one crime of opium*, what crime have I not made myself guilty of? After my death, I earnestly entreat that a full and unqualified narrative of my wretchedness and its guilty cause, may be made public, that at least some good may be effected by the direful example."

The following extract from a pamphlet published at Calcutta under the title of "Remarks on the Opium Trade with China," is well written, and expresses in an excellent manner the more injurious effects of opium over ardent spirits:—

"The intoxicating property or, rather properties, of opium, differ in their nature from the intoxicating property of alcohol. In some respects the effects of the intoxication are also different. They both agree, however, in this, that they both stimulate the nervous system to an unnatural degree, and are only fit for use when such a state of bodily illness already exists as to make a stimulus of this nature subservient to the restoration of other vital functions disordered. They both agree in this, that the pleasurable sense of excitement attending their indulgence is followed by a relaxation of the system, and an undue depression of both the bodily and mental powers when the excitement is over.

"They both agree in this, as a consequence, that the oftener they are indulged in for the sake of this pleasurable sense of excitement, the greater must be the quantity used, in order to keep up that same degree of excitement; so that, if once the appetite is formed, constantly increasing indulgence is necessary and almost inevitable, and not only so, but is yielded to unconsciously of this increase. The craving of the appetite is insensibly the man's standard for estimating what he can (as he supposes safely) indulge in. They both agree in this, that they disorder the digestive organs, predispose to most other diseases, and materially shorten the term of life. They both agree in this, that they stupify and derange the intellectual powers, and that habitually; for

the seasons of depression are quite as far below healthy mental vigour, as those of alternate excitement are beyond. And over the final stages of mental suffering to which they both lead, one is fain to draw the veil; fiction can paint nothing of horror half so horrible. They both agree in this, that they utterly corrupt the moral sense: give to gross appetite the reins of reason: * deprave and brutalize the heart: shut up all the avenues to conscience: and make their victim the easy prey to every temptation that presents itself.

"There is but one point of difference between the intoxication of ardent spirits and that of opium deserving of particular attention here; and that is, the TEN-FOLD force with which every argument against the former applies to the latter. There is no slavery on earth to name with the bondage into which opium casts its victim. There is scarcely one known instance of escape from its toils, when once they have fairly enveloped a man. We need not appeal to the highly-wrought narrations of personal experience on this subject, which have of late years come before the public; they rather invite distrust than otherwise, by the exaggeration of their poetical style. But the fact is far too notorious to be questioned for one moment, that there is in opium, when once indulged in, a fatal fascination, which needs almost superhuman powers of self-denial and also capacity for the endurance of pain, to overcome.

"The operation of opium is, on this account, more deadly by many degrees than its less tyrannous rival. In other respects above-mentioned there is generally a more rapid and more permanent influence exerted by opium than by ardent spirits: an influence so directly inimical to all human happiness whatever, that if the facts were not before our eyes, we might well doubt the cunning of the arch fiend himself to recommend to one son of Adam the use of such an instrument of self-destruction."

We purposely abstain from any lengthened discussion of the merits or demerits of opium as an article of justifiable luxury. So much has been said and written on the subject that the question must be now sufficiently exhausted; we therefore abstain from quoting the opinions of physicians at home or travellers through Europe, who have given their testimony on the subject. It has been asserted that it is a justifiable and necessary article of luxury in Asia. Now let us see how this assertion is borne out by the evidence of those who have witnessed its operation. The opinion of the Dutch Commissioners who sat at the Hague is thus quoted by Sir Stamford Raffles in

his "History of Java."* "The opium trade requires likewise attention. The English in Bengal have assumed an exclusive right to collect the same, and they dispose of a considerable number of chests containing that article annually at Calcutta by public auction. It is much in demand on the Malay Coast, at Sumatra, Java, and all the islands towards the east and north, and particularly in China, although the use thereof is confined to the lower classes. The effect which it produces on the constitution is different, and depends on the quantity that is taken, or on other circumstances. If used with moderation, it causes a pleasant, yet always somewhat intoxicating sensation, which absorbs all care and anxiety. If a large quantity is taken, it produces a kind of madness, of which the effects are dreadful, especially when the mind is troubled by jealousy, or inflamed with a desire of vengeance, or other violent passions. At all times it leaves a slow poison, which undermines the faculties of the soul, and the constitution of the body, and renders a person unfit for all kinds of labour and an image of the brute creation. The use of opium is so much more dangerous, because a person who is once addicted to it can never leave it off. To satisfy that inclination, he will sacrifice everything,—his own welfare, the subsistence of his wife and children, and neglect his work. Poverty is the natural consequence, and thus it becomes indifferent to him by what means he may content his insatiable desire after opium; so that at last he no longer respects either the property or life of his fellow creatures."

Mr. Hogendorp further confirms this opinion, by saying, "*Opium is a slow, though certain poison*, which the Company, in order to gain money, sells to the poor Javanese. Any one who is once enslaved by it, cannot, it is true, give it up without great difficulty; and if its use were entirely prohibited, some few persons would probably die for want of it, who would otherwise languish on a little longer; but how many would by that means be saved for the future! Most of the crimes, particularly murders, that are now committed, may be imputed to opium as the general cause." To this is added a sentiment in which we entirely concur. "The trade in opium is one of the most injurious and most shameful things which disgrace the present government of India."

Now let us approach the shores of China, and hear what is said by those who were eye-witnesses of its effects. Mr. Gutzlaff

* We recommend this whole extract to the author of a Letter to Mr. Horsley Palmer, recently published in the Times Newspaper.

made many voyages along the coast, and details in a graphic manner the horrors of the practice and its destructive effects on both life and morals. Mr. Medhurst, whose experience is of still more recent date, says, "Those who have not seen the effects of opium smoking in the eastern world, can hardly form any conception of its injurious results on the health, energies and lives of those who indulge in it. The debilitating of the constitution, and the shortening of life, are sure to follow in a few years after the practice has been commenced, as soon and as certainly, if not much more so, than is seen to be the case with those unhappy persons who are addicted to the use of ardent spirits. The dealers in opium are not aware how much harm they are the instruments of doing, by carrying on this demoralizing and destructive traffic; but the difference in the increase of the Chinese people before and after the introduction of opium (!) ought to open their eyes, and lead them to ask themselves whether they are not accountable for the diseases and deaths of all those who have suffered by its introduction. And if it be true, that the Chinese increased at the rate of three per cent. per annum before the commencement of the traffic, and at the rate of one per cent. per annum since, it would be well for them to consider whether the deficiency is to be attributed in some degree to opium, and the guilt to be laid at the door of those who are instruments in introducing it."*

Since the opium trade has come under discussion in this country, a variety of arguments have been adduced by those who favour the present system, in order to do away with the impression against its continuance now made upon the public mind. These we wish to mention, that the narrow and selfish views upon which the system is upheld may be exposed. We can judge very fairly of the goodness of a cause by the kind of reasoning brought forward to support it. We have shown the fallacy of the assertion that opium is no more injurious than ardent spirits, and that it is a necessary luxury nowise detrimental to health. It is said that the Chinese government does not oppose the importation of the juice of the poppy from any conviction of its poisonous qualities, but because native silver is given in exchange. We have no means of judging of the motives of these people but from the documents which have been translated, and those certainly do not favour such an assumption.

Although originally the prohibition may

have been framed on the mistaken principle of political economy "that it was improper that the pure and sycee silver of the inner land should be exchanged for the vile dirt of foreign countries, yet since the investigation of the subject by the authorities, much more correct views have been taken. In the memorial presented to the emperor by Heu Naetse, vice-president of the Sacrificial Court, there runs the following passage:—"In the *Materia Medica* of Le Shechin opium is called afoogung. When any one is long habituated to imbibing it, it becomes necessary to resort to it at regular intervals, and the habit of using it being inveterate, is destructive to time, injurious to property, and yet dear to one even as life. Of those who use it to great excess, the breath becomes feeble, the body wasted, the face sallow, the teeth black. The individuals themselves clearly see the evil effects of it, yet cannot refrain from it. It will be found on examination that the smokers of opium are idle lazy vagrants, having no useful purpose before them, and are unworthy of regard or even contempt; and though there are smokers to be found who have overstepped the threshold of age, yet they do not attain to the long life of other men."

The testimony of Choo Tsun and many other mandarins of eminence is to the same effect, and shows that they were perfectly acquainted with all the evils of opium smoking.

In addition to the evident detriment to health and loss of life among the Chinese caused by the consumption of opium, the system of smuggling it into the country produces consequences of importance. The greatest corruption of the affairs of government necessarily ensues, bands of desperadoes are fostered and encouraged, and loss of life is frequently occasioned by their collision with the authorities. The quiet natives are also frequently plundered and oppressed. In addition, the efforts made to convert the natives to Christianity are completely thwarted, as the missionaries are constantly confounded with the smugglers, and all their endeavours to disseminate religious publications met with suspicion and indignity.

These are some of the evils which accrue to the Chinese from the opium traffic. They might have been enlarged upon and treated more in detail, but we fear we have already said enough to entitle us to rank among those who are stigmatized as "ethereal dreamers, sentimental philosophers, and scrupulous moralists," from having upheld these opinions. Really we can see no grounds for such abuse. The practice is

* China, page 56.

disgraceful and calls for redress. It is not to be tolerated on grounds of humanity. The English supply the Chinese with a deadly poison with which thousands yearly put a period to their existence. In *England* the chemists are expressly ordered not to supply arsenic or laudanum if they have the slightest suspicion that their customer intends to commit suicide with it. Policemen are also stationed on the bridges of the metropolis to see that no wretched creature throws himself into the water. In *China* every facility is afforded and material supplied for wholesale self-slaughter. One maxim we see has been adopted from the Chinese—the most enlightened doubtless—that “not only are there different *conditions*, but also different *sorts* of men.”

As we do not believe that the opium trade would be abolished merely on grounds of humanity, we now proceed to show its pernicious influence on legitimate commerce and the true interests of our country. The objects to be attained are feelings of respect and good-will on the part of the Chinese by which the obstructions to our intercourse are to be overcome. The opium trade has always been a fertile source of suspicion and annoyance. Kiā-King at the commencement of his reign forbad its introduction, and shortly afterwards fines and chastisements were inflicted upon those who broke the laws in this respect. The evil still increasing, and the injurious tendency of opium smoking becoming more apparent, heavier punishments were imposed upon the delinquents. From strokes of the bamboo and the servitude of the wooden collar, the seller and smoker of opium became subject to imprisonment, exile, and entire confiscation of his property. Latterly the poor wretches have suffered capital punishment, and been publicly strangled.

At the same time the preventive police on the river was strengthened, and the strangers watched with the greatest jealousy. The Hong-merchants were also required to become security for foreign vessels, and to give a bond that they should not enter the port with any of the forbidden article on board. The supercargoes were also required to enter into the same sureties. Frequent interruptions to the tea-trade occurred from seizures made on the river, and the greatest impediments were thrown in the way of a ready communication with Macao. These difficulties led to the establishment of the station of Lintin, where vessels were constantly anchored as storehouses for the contraband articles. Notwithstanding the efforts made to dislodge them, the number of these ships has increased, and

they have become the warehouses of other goods besides opium which are forbidden by the government. Frequently an evasion of the port dues alone is attained by vessels discharging their cargoes at Lintin, to be sent up the river by other ships. Thus a great advantage is obtained over the fair traders, so much so as to render it a matter of doubt whether the whole commerce would not become contraband after a while. Another point deserves attention. The increase in the smuggling traffic has given rise to considerable alarm with some of the residents at Canton. As the transition from smuggling to piracy has often occurred in other parts of the globe, the presence of so many armed vessels on the coast of China has raised the fears of the more timid, and advice was given to commanders to be cautious in letting strangers board their ships in those seas.

These things which have been mentioned are highly detrimental to commerce, and are felt by all those who trade to Canton. But the English merchants more particularly are the sufferers by the opium trade, as the Chinese consider the whole traffic in their hands, and that they are therefore responsible for all the evils which it entails. All the chests which come from the British possessions in India have the mark of the East India Company upon them, which the natives are well acquainted with; and we have seen that the drug which in their estimation is the best, is called by their name. Many of the native documents show the light in which we are regarded as a people by the government of China on its account. They naturally look upon the English as engaged in a deliberate and systematic violation of their laws, for the purpose of profiting by the sale of a drug which poisons and ruins a large proportion of their population.

Choo Tsun, whose memorial has been already quoted, says, in the History of Formosa we find the following passage:—“Opium was first produced in Kaoutsinne, which by some is said to be the same as Kalapa (Batavia). The natives of this place were at first sprightly and active, and being good soldiers were always successful in battle. But the people called Hung-maou (Red-haired) came thither, and having manufactured opium, seduced some of the natives into the habit of smoking it. From these the mania for it rapidly spread throughout the whole nation, so that in process of time the natives became feeble and enervated, submitted to the foreign rule, and ultimately were completely subjugated. Now the English are of the race of foreigners called Hung-maou. In introducing opium into this country their purpose has been to

weaken and enfeeble the central empire. If not early aroused to a sense of our danger, we shall find ourselves ere long on the last step towards ruin. The repeated instances within a few years of the barbarians in question having assumed an attitude of outrageous disobedience, and the stealthy entrance of their ships into the provinces of Fuhkeën, Chekeang, Keängnan, and Shantung, and even to Teëntsin—to what motives are these to be attributed? I am truly unable to answer the inquiry. But reverently perusing the sound instructions of your majesty's all-wise progenitor, surnamed the Benevolent (Kanghe), I find the following remark by him, dated the 10th month of the 55th year of his reign (1717):—"There is cause for apprehension lest in centuries and milleniums to come China may be endangered by collision with the various nations of the West who come hither from beyond the seas." I look upwards, and admiringly contemplate the gracious consideration of that all-wise progenitor in taking thought for the concerns of barbarians beyond the empire, and giving the distant future a place in his divine and all-providing foresight. And now, within a period of two centuries, we actually see the commencement of that danger which he apprehended." We can scarcely imagine that more forcible reasoning than the following could be advanced to awaken the fears of a pusillanimous and despotic monarch.

"With admiration I contemplate my sacred sovereign's anxious care for imparting a military as well as a civil education, prompted as this anxiety is, by the desire to establish on a firm basis the foundations of the empire, and to hold in awe the barbarians on every side. But while the stream of importation of opium is not turned aside, it is impossible to attain any certainty that none within the camp do ever secretly inhale the drug. And if the camp be once contaminated with it, the baneful influence will work its way, and the habit will be contracted beyond the power of reform. When the periodical times of desire for it come round, how can the victims—their legs tottering, their hands trembling, their eyes flowing with child-like tears—be able in any way to attend to their proper exercises? or how can such men form strong and powerful legions? Under these circumstances, the military will become alike unfit to advance in the fight, or in a retreat to defend their posts. Of this there is clear proof in the instance of the campaign against the Yaou rebels, in the 12th year of our sovereign's reign (1832). In the army sent to Leénchow on that occasion, great numbers of the soldiers were opium smokers, so that although their numerical force was large,

there was hardly any strength to be found among them."

These arguments may be supposed to have considerable weight, when it is recollected that the Chinese are well aware of the progress of British arms in India, and have themselves witnessed the forcible passage of the Bogue and the successive attempts to gain possession of Macao. The fears and hatred of the natives would be still further increased by the memorial of Heu Kew, sub-censor of the military department, who reasons: "Some think this mode of proceeding too severe, and fear lest it should give rise to a contest on our frontiers. Again and again I have revolved this subject in my mind, and reconsidered how that, while in their own country no opium is smoked, the barbarians yet seek to poison therewith the people of the Central Flowery Land. I have, therefore, regarded them as undeserving that a single careful or anxious thought should be entertained on their behalf. Of late, the foreign vessels have presumed to make their way into every place, and to cruize about in the inner seas. Is it likely, that in this they have no evil design of spying out our real strength or weakness?"

One more extract from native documents we shall make in order to show that the Emperor was advised long ago to cut off the foreign trade altogether, rather than allow the opium traffic to be carried on.

"The treatment of those within having been rendered severe, we may next turn to these resident foreigners, examine and apprehend them, and keep them in arrest, then acquaint them with the established regulations, and compel them within a limited period, to cause all the receiving ships anchored at Lintin to return to their country. They should be required also to write a letter to the king of their country, telling him that opium is a poison which has pervaded the inner land, to the material injury of the people; that the celestial empire has inflicted on all the traitorous natives who sold it the severest penalties; that with regard to themselves, the resident foreigners, the government taking it into consideration that they are barbarians and aliens, forbears to pass sentence of death upon them; but that if the opium receiving ships will desist from coming to China, they shall be indulgently released, and permitted to continue their commercial intercourse as usual; whereas if they will again build receiving vessels, and bring them hither to entice the natives, the commercial intercourse granted them in teas, silk, &c., shall assuredly be altogether interdicted, and on the resident foreigners of the said nation the laws shall be executed capitally. If commands be issued of this plain and energetic character,

in language strong and sense becoming, though their nature be the most abject—that of a dog or a sheep, yet having a care for their own lives, they will not fail to seek the gain and to flee the danger.”

Recent events have proved that the threats of the Chinese are not altogether to be despised, and that they would proceed to these extremities if they found milder means ineffectual. In short, there cannot be a shadow of doubt that the opium trade had a most pernicious influence on all our dealings with these people. That it served to widen the breach which separated us from them, and stirred up all their prejudices, and reflected the greatest disgrace on those who were concerned.

Many of the resident merchants at Canton, who did not deal in opium, openly entered their protest against its continuance, and even those who were most implicated, whose interest it was to uphold its character, were evidently ashamed of their conduct, and tried to shift the blame upon other shoulders. A specimen of this species of excuse occurs in the speech of Mr. Jardine, made at a public dinner in China just before his departure for England:—“I hold the society of Canton high: it holds a high place in my opinion, even among the merchants of the East. Yet I also know that this community have often heretofore and lately been accused of being a set of smugglers; this I distinctly deny; we are not smugglers, gentlemen. It is the Chinese government, it is the Chinese officers who smuggle, and who connive at and encourage smuggling—not we. And then look at the East India Company: why the father of all smuggling and smugglers is the East India Company.” Now, we believe we have sufficiently proved that the Chinese oppose the introduction of opium on moral considerations, and their late conduct shows that they were in earnest in this opposition. The East India Company took no part whatever in the traffic. On the contrary, so well aware were the Select Committee of its injurious tendency, and the necessity of upholding the national character by courting respect and esteem, that an officer would have been immediately dismissed from the service if detected in bringing any opium up the river.

How long the opium trade would have continued, and to what extent it would have been carried if the Chinese government had not exerted itself with vigour, may well be questioned. We fear that it would have been a long time before feelings of humanity would have supplanted those of interest. The immense profits derived from this impure source, hold out too great a temptation

to be easily withstood, and the upbraidings of conscience are frequently stifled by specious arguments. Among these may be reckoned the assertion, that the opium trade is effecting the emancipation of the Chinese people, by degrading the official classes who are becoming dependent, through the habit of opium-smoking, on foreign intercourse. This, to say the least of it, is supporting the scouted dogma—that it is right to do evil that good may come.

It is said also, that if the English gave up the opium trade, some other nation would take it up, and we should be the losers for our folly. We believe that no other nation would do so—because they have neither the means nor the inclination. Before they could manufacture a sufficient quantity of the poison, and fit out ships to carry it to the market, the Chinese government would have effectually eradicated the destructive habit. Again, they know that if they traded in opium they could trade in nothing else—all their legitimate commerce would be stopped. Already have the representatives of the different European states tried to curry favour with the authorities at Canton, by showing that they were not at all connected with the smugglers, and it is highly probable that the same system of underhand calumny is carried on at the present day as formerly, for the purpose of securing a monopoly of the China trade.

One other reason we have heard assigned for the continuance of the present system, and this is the last we shall notice. It is that if the capitalists who are now engaged in it were to give it up, the traffic would fall into the hands of low common smugglers, and the coast of China be infested in time with desperadoes, little better than buccaneers. In other words, because there are always to be found blackguards and vagabonds ready for any evil purpose, therefore their office is to be undertaken by *gentlemen*, who have means to do the mischief with greater certainty, and on a much larger scale. In point of fact, it is the capital employed in this traffic which makes it successful. If the arrangements and equipments of the vessels were not so complete, the opium trade might be suppressed by the Chinese.

But enough—probably at the time we are writing, the opium trade may be over; the death-blow may have been given to it by the seizure at Canton, and it only remains to be considered whether the means adopted to effect that object were justifiable, and to consider the policy which should be pursued in consequence. We have no hesitation in asserting our conviction, from the abundant

warning that was given, that these events ought not only to have been foreseen but prevented. The peculiar position in which Captain Elliot was placed, deserves to be attentively considered, as he evidently appears to have been unacquainted with it himself, and consequently not to have known how to act in the emergency.

It is familiar to every one that before the expiration of the Charter, the Chinese considered the terms *English* and *East India Company* synonymous, and regarded the Presidents of the Select Committee as the rulers of all the people of that nation. They were on that account called *tae pans*, or head men, and to them were referred all matters in dispute. At the cessation of the monopoly, the native authorities requested that other *tae pans* might be sent out in the place of those of the Company. As the Select Committee had had the entire control over the British seamen and commerce, they were looked upon as responsible for all acts committed by them under their care, which were at variance with the laws of the country. The superintendents of British trade in China were appointed by government to replace the supercargoes of the East India Company, to have all their powers, and the entire control and regulation of the commerce. They were regarded, therefore, by the natives as placed entirely in the same position as the *tae pans*, and had to bear all the onus of their misdeeds.

It signifies little what powers were entrusted to Elliot by the ministers at home, whether he was entitled to rank as a consul, a plenipotentiary or a commissioner; and evidently he has acted as if all and each were his due; but the Chinese regarded him as a veritable *tae pan*. They know or care nothing about our titles and distinctions, but made themselves well acquainted, as they thought, with his intentions, before they allowed him to proceed up the river. His own explanation to the messengers sent down to Macao, from the Viceroy of Canton, was:

"My name is Elliot; I am an English officer of the fourth rank; in the autumn of the 14th year of Taou-kwang, I arrived here in a cruiser, which was duly reported by the pilots. During the two years, whilst residing at Macao, I have been engaged in signing the passports of the English ships bound homewards. And now the Company's factory is not re-established, and no *tae pans* arrived; but having received a dispatch from the great ministers of my king, directing me to control the merchants and seamen, and not to manage their commercial affairs, and also credentials; I am instructed thereby to proceed

to the city in an official capacity; and in case of difficulties among the merchants or seamen, to control them, &c."

The Viceroy in his report to the Emperor, after expressing some uncertainty as to the meaning of terms, comes to the following conclusion:

"Upon examination, I find that since the dissolution of the English Company's factory, no *tae pans* have arrived here; that for the last year the said barbarian Elliot has been engaged at Macao in signing the manifesto of English ships homeward bound, and quietly attending to his business; that the arrival of ships from his country being frequent, and the merchants and seamen numerous, it is necessary, without delay, to have some one to oversee and keep them in order; that the said barbarian has received credentials from his country, with instructions to control its merchants and seamen; and *that he is really the same as the tae pans*, though the name be different, it merely substituting one barbarian for another, which change, as it leads to no evil consequences, I suppose may be allowed."

Captain Elliot evidently had no other powers with the Chinese than that of *tae pan*, for they allowed no other, and therefore cannot be considered even by us as consul. Consular powers cannot be conferred by a government at home, without having previous international sanction that they will be held valid when the officer arrives at his station. The duty of Captain Elliot was thus to superintend the trade and to see that the laws of the country were respected; that everything was conducted regularly and peacefully. He was responsible in these matters, not only to his own government, but to that of the Chinese, as they had allowed him admission with that understanding. He should therefore have had nothing to do with the opium trade, which was contraband, and on that account beyond his jurisdiction. The free, legitimate commerce he came to superintend, and ought to have avoided any appearance of connection with the illicit. This had been the policy of the Select Committee of the Company, and should have been adopted by their successors. If, however, he mixed himself up with the smugglers, and afforded them any protection, the Chinese would naturally consider him as one of them, as part and parcel of the same tribe. He would, therefore, not have a claim for exemption from any measures they might think proper to adopt for their suppression.

That the Chinese had an undoubted right to endeavour to suppress the importation

and consumption of that which they considered a deadly poison, no one will attempt to deny. They formed their resolution of adopting vigorous measures, after the strictest investigation, and the necessity became urgent. These are well known. After inflicting various punishments upon the natives, without stopping the progress of the evil, they resorted to the expedient of raising public indignation against the foreigners, by strangling criminals convicted of opium-smoking in the square before the factories of Canton. One of these executions took place on the 12th of last December, when the populace became so excited, that a serious disturbance took place, and the residents were obliged to call in the aid of the native police. This created very serious alarm, and the foreigners began to consider their situation critical. This was followed by the arrival, at the provincial city in March, of "a high imperial commissioner, who, having repeatedly performed meritorious offices, was sent to settle the affairs of the outer frontier." The Commissioner, Lin, was invested with imperial authority, and carried the Great Seal, which had only two or three times been intrusted to high officers of state. His powers, therefore, were unlimited, and there is little doubt but that he stood highly pledged to exert himself to the uttermost in the suppression of the opium trade.

The course he pursued for this purpose must be allowed to have been extremely moderate, and much milder than would have been adopted by any other people. He arrested and closely examined the hong-merchants and linguists so as to ascertain from them the parties who were implicated in the forbidden traffic, and finding that the greater number of the foreign residents had been or were at that time dealers in opium, he issued a proclamation to them. In this document, after expatiating upon the favours conferred by the Emperor in allowing them to trade in tea and rhubarb, he says that the indignation of the whole nation is roused against them on account of their persisting in introducing a poison against the repeated commands of the government. He orders them, therefore, to deliver up all the opium now in their possession, that it may be destroyed, and to give a pledge that it shall not be brought by them in future. An unsatisfactory answer being returned by the Chamber of Commerce, measures were taken to enforce compliance. The passage down the river was impeded, the grand chops were refused, so that the trade was effectually stopped, and the foreigners were virtually prisoners in their factories. To what ex-

tent these coercive measures would have been carried, and how far they would have been successful, it is impossible to say. But the probability is that liberty would have been restored whenever the real smugglers were delivered up, and on them alone would punishment have been inflicted. This appears evident from the statement of the Lum-chuy, that he was well acquainted with the names of the offenders, and from the apologies he made to the innocent sufferers for keeping them in durance.

In the mean time Captain Elliot, residing at Macao, and hearing of the preparations made at Canton to carry the resolution come to by the government into effect, immediately issued an order for all the ships to assemble, and to put themselves into a warlike posture. As the greater number of these were engaged in the contraband trade, what effect would this have upon the minds of the authorities but to convince them that the superintendent had the control over not only the vessels of the free trade but those also of the opium traffic, and that he authorized and assisted them in their resistance to the laws of the land?

Again, after all this parade of power, what did he do? Why, thinking, no doubt, that the Chinese must be intimidated, and that his presence alone would be necessary to overawe the Imperial Commission and put a sudden stop to all the disturbances, he went up to Canton and tried to exercise that authority which he supposed himself to possess. That he was disappointed no one can wonder. He committed exactly the same error of judgment as did Lord Napier, and suffered equal mortification and defeat. Instead of being respected as the representative of a powerful nation, he found himself a prisoner at the mercy of the Chinese. What reason had he for going up to Canton at that particular time alone and unassisted, when the investigation of the opium trade was taking place? No plan was laid to entrap him, but he ran himself into a net prepared for others. This taking upon himself to negotiate with the mandarins upon the subject of opium made them naturally regard him as the responsible person and treat him accordingly. Truly it is a most difficult matter to deal with the Chinese, requiring the greatest tact and delicacy, but Elliot certainly in many points showed himself inferior to the task.

This appears to us to be the real state of the case, and we cannot see how, under the circumstances, he was justified in acting as he did. He exceeded his commission entirely in ordering the opium to be delivered up, on a pledge that the British government

would indemnify the owners for the sacrifice. He had no right to give such a surety and therefore his promise should pass for nothing. The opium dealers must put up with this loss in the best way they may, unless they find out some means of obliging the Chinese to make restitution. As they would have derived great profits if the speculation had turned out well, they must submit to bear the burden of its failure, instead of shifting it on the shoulders of others.

We cannot see that the Chinese have in this case acted in such a manner as to justify our proceeding to extremities with them. We have shown that the contemptuous treatment of Elliot is entirely to be attributed to his own mismanagement, and a war would scarcely be deemed advisable because a large party of smugglers have been punished. Something should be done, however, to prevent a recurrence of the insults offered to the fair traders resident at Canton, or else they will always be held responsible for the misdeeds of others with whom they have no connection, and over whom they have no control. Their liberty and lives will be in continual jeopardy, and they will be really security for the good behaviour of the whole world. An armed interference would be totally unsuccessful unless carried on upon a very extensive scale; and if once begun it must be persevered in, or else it would inevitably ruin our trade and our moral influence in the East. There are plenty of competitors in China, who are always ready to take advantage of any occurrence to further their own interests at our expense.

The plan which seems most advisable in the present posture of affairs, and which would at the same time test the sincerity of the members of the Chamber of Commerce, is to get all the foreign merchants trading to China to agree to suspend the trade altogether until apologies had been made for the treatment they had suffered, and a pledge given that it should not be repeated. The opium which has been seized may at the same time be demanded under promise of its being carried from the coast. No one at all acquainted with the Chinese believes that it has been burnt or otherwise destroyed. This plan would be successful if sufficient dependence could be placed upon the co-operation of the merchants. The only fear is that individual interests would outweigh the public good. The Chinese government would quickly be made to submit to these conditions from fear of the rebellion of those hundreds of thousands of people who have been for a long time entirely supported by the foreign trade; and probably the loss to the revenue

derived from that source would assist to turn the scale in our favour.

For the future the rule of conduct is evident. The fair and the illicit commerce cannot both be sanctioned. One must be cherished and the other discouraged; and both humanity and policy point out which should be chosen. If the East India Company were to cease to manufacture opium, and our government were to forbid its importation into China under the British flag, the smuggling trade would then be at an end, and a foul stain be wiped out from the national escutcheon.

Before giving upon a subject of so much importance in every point, some additional details, even at the risk of partial repetitions, we cannot but express surprise that everything like protection by a naval force should have been withdrawn from our merchants, and this too at a time when, by the opening of the trade and the removal of the East India Company's authorities, our ministry had incurred the double responsibility of directing the nefarious traffic through their own superintendents, and protecting the new competitors introduced by their own act. Prevention is better than cure; but our present rulers seem everywhere strangely ignorant of the moral influence of an effective physical force; and yet the slightest foresight would have observed the inevitable approach of the present crisis.

The cultivation of poppies is carried on to a great extent in various parts of the East Indies; but more particularly in Bengal, where the means of transition and the nature of the soil offer peculiar advantages to the cultivator. But in the district of Malwa it is obtained to such an extent, that it is said to amount to nearly half the whole produce of India, and the quality is reckoned greatly superior to that of Turkey and Persia, and equal to the rival districts of Benares and Patna. The cultivation here is entirely free, and the sale only encumbered with a small transit duty on the passage through Bengal. In Benares and Patna, on the contrary, the growth of opium is monopolized by the government, and any unauthorized individual attempting to establish a plantation for his own advantage would be speedily ejected, or compelled to sell the product of his labours, at the regular price, to the authorities. The usual mode of cultivation is as follows:—A certain portion of land is awarded to the ryot or peasant, and an advance of money tendered to enable him to pursue his avocation with advantage; should

he prove refractory, the money is thrown into his house, and he is compelled to return to his unprofitable business. Such being the case, he commences in the month of November by planting the seed in small squares, having a trench or path between each for the convenience of watering and tending the plants, and of gathering the juice; the former operation is rendered indispensable by the growth of the poppy taking place entirely in the dry season: the best and richest land is required, and it is said that the greatest care will not produce in India so fine a plant as will grow with little trouble in the cooler countries. In the month of February, or a little later, the operation of collecting the opium commences; previous to which, however, the agents of the government have made a valuation of the different lands, and have discerned, with considerable accuracy, the quantity of opium each ryot ought to deliver to the Gomashah. An incision is made in the head of the poppy, and the juice carefully collected from day to day, the ryot, his family, and his servants (if he have any) assisting; notwithstanding which a great loss of the juice takes place, from its running over the stem of the plant immediately on the first incision. As the opium is thus gathered, it is delivered each day to the agent, who keeps a regular account with the ryots, of the products of their various farms. The juice is required to be of a certain consistency, which is tried in the following manner: the receiver takes a portion out on his finger and turns it over, when if it still adheres it is reckoned sufficient; if, on the contrary, it drops, either it is returned to the cultivator to be further evaporated, or he is compelled to render an extra quantity to supply the deficiency. The drug is then weighed, and the ryot receives about three rupees and a half for every seer (1 lb. 13 oz). If he be suspected of embezzling any part of the product of his industry, an action in the civil courts is commenced for its recovery.

The cultivation of opium has been increasing with great rapidity of late years, and every other article has been neglected, or driven entirely from the districts where it is grown, and as only the best soil can be employed for the purpose, many harmless and valuable productions have given place to this noxious extract. Thirty-five thousand chests is reported to have been the product last year of the whole of India, each chest weighing, on an average, 125 pounds. The destination of this enormous crop is pretty clearly explained in the following extract from an article "*On the Preparation of Opium*"

um for the China Market," written by an opium examiner of the Benares agency.

"The great object of the Bengal opium agencies is to furnish an article suitable to the peculiar tastes of the population of China, who value any sample of opium in direct proportion to the quantity of hot-drawn watery extract obtainable from it, and to the purity and strength of the flavour of that extract, when dried and smoked through a pipe. The aim therefore of the agencies should be to prepare their opium so that it may retain as much as possible its native sensible qualities, and its solubility in hot water. Upon these points depend the virtually higher price that Benares opium brings in the China market, and the lower prices of Behar, Malwa, and Turkey opium. Of the last of these equal (Chinese) values contain larger quantities of the narcotic principles of opium, but are, from their greater spissitude and the less careful preparation of the Behar and Malwa, incapable of yielding extracts in equal quantity and perfection of flavour with the Benares."

From this statement it would appear, that if the East India Company have not actually engaged in the sale to China of the interdicted article, they have at all events permitted and seconded the proceedings of the merchants, a system which is strangely at variance with their promise to assist the Chinese government in suppressing the opium traffic.

After the opium has been collected in the manner described, it is forwarded across the country to Bengal, whence a small portion is transmitted to Europe, and the major part disposed of to the merchants.

The vessels used for the transport of the opium to the shores of China are for the most part small schooners or brigantines, built solely for the purpose, with low hulls, cutting the waves in such a manner as to keep the decks almost perpetually wet, a circumstance which renders them unfit for any other trade. But the speed with which they beat up against the north-east monsoons, blowing steadily from November to April, and the excellence of the general appointments, render them the admiration of every service, and class them among the finest vessels that cleave the waters of any latitude. On their arrival at Macao the opium clippers, as they are technically called, sometimes discharge their illicit cargo into an old vessel moored there for the purpose, or they pass on to Lintin, where there are seven or eight large receiving ships, in which the drug is left till it can be smuggled on shore. The manner in which this is

conducted, is among the most remarkable features of the trade.

In the first place, it is necessary that the authorities of Lintin and Macao should see nothing of the traffic; accordingly a complete system of bribery is adopted, and the custom-house officers, from the highest authorities to the common servants, are held in pay by the merchants. Even the magistrates and governors are not always inaccessible. All difficulties at the ports being thus removed, or materially lessened, the next object is to convey the opium on shore and distribute it among the dealers. This is performed by light native boats called "fast crabs," which defy pursuit, should it be attempted, and are always ready for a desperate resistance if attacked. By these the opium is conveyed to the dealers, and spread through the country like the humours of a poisoned wound, destroying health and vigour and virtue in its baneful progress.

This is the mode usually employed to land the cargo at the different sea-port towns, but if it be designed for the Canton market, a far more complete and organized system is required.

No European vessel is allowed to approach nearer than Lintin; the opium must therefore be conveyed to Canton in the boats of the country. Several English brokers have for years past resided at Canton, to whom a commission is allowed for the sale of the article, in the same manner as to the mercantile brokers of Europe; to them the native merchants apply for the drug, and having concluded the bargain, receive an order for the delivery of the opium, and pay for it on the spot in silver. The order is delivered at the receiving ships, and the chests carefully stowed and concealed in the long snake-like boats to be conveyed to Canton. The abuses which follow on this mode of conveyance may be supposed from analogy to the smuggling of other countries; they form no inconsiderable part of the danger and injury of the trade. The river is covered with government junks, solely for the purpose of preventing the traffic, and the shores are lined with custom-houses and forts; all these must be silenced by bribes; and as the system is pursued in every sea-port in China, the Emperor has not, through the whole of his extensive coasts, a single man that he can trust. The boats are manned by desperadoes of the worst character, well armed, and ready and willing for any act of violence that may offer; or if any thing should drive them from their usual employment, they turn, by an easy transition, to the kindred profession

of piracy. Occasionally also they are met and boarded by a mandarin boat, containing perhaps from thirty to forty men; the traders are fewer, but much better armed, and a sanguinary conflict ensues, which is terminated sometimes by the arrival of another mandarin, at other times by the escape of the "fast crab." Heu Naetse, the vice-president of the Sacrificial Court, in a memorial to his sovereign on the subject of opium, gives the following description of one of those encounters.

"The late Governor Loo, on one occasion, having directed the Governor Tsin Yu-chang to co-operate with Teën Poo, the district magistrate of Heängshun, they captured Leang Heënnée, with a boat containing opium to the amount of 14,000 catties. The number of men killed and taken prisoners amounted to several scores."

Such are the direct evils arising from the system of smuggling, but collateral abuses naturally follow and swell the list to a degree never before inflicted in time of peace by a civilized country.

The officers thus tempted from their duty by the wealth and influence of the British merchants, become hardened by habit and eager for bribes, and ready for violence and extortion. Nor are there wanting a class of desperadoes who prowl the seas and rivers under a fictitious authority, board the vessels of the peaceful natives under the pretext of searching for opium, and either by intimidation or violence plunder the defenceless proprietors of their well-earned property; these of course speedily change into bold and dangerous pirates, and thus is England constantly increasing the number of marauders in the Indian seas, those seas which but a few years back were almost cleared by the power of her arms.

We now come to the great and crying evil of the opium trade, its demoralizing and fatal effects on all classes of people in the Chinese dominions. We learn from Medhurst's China that in the year 1816 the importation of opium into those realms was 3210 chests, which were sold for 3,657,000 dollars, or 1139 dollars per chest; in 1836 the importation was 27,111 chests and the value 17,904,248 dollars, or 660 dollars per chest, proving that while the consumption of the article has increased more than eightfold in the last twenty years, the price has sunk to scarcely more than half the original value. To prevent this immense importation, no effort has been spared on the part of the Chinese government, remonstrances have been dispatched again and again to the

British merchants, menaces have been equally disregarded, the property of the native dealers has been seized and confiscated, and punishment inflicted sometimes even to death, and still without checking the increasing magnitude of the evil ; can it be wondered at that, wearied by useless efforts and exasperated by insolent resistance, the Emperor has at length resorted to the last expedient, and broken off an intercourse which no longer yielded profit to his country, but paid for her useful luxuries with misery, disease and death ?

From the authority above quoted is derived the following statement of the increase in the population of China since the year 1711. From that year to the year 1753, the population had advanced from twenty-eight millions and a half to one hundred and three millions, being at the rate of three per cent. per annum. This extraordinary increase may be accounted for in the following manner : according to the precepts of Confucius, " of the three degrees of unfilial conduct, to be without posterity is the first ;" in accordance with which decree, every Chinaman, be his station what it may, marries young, and rejoices above all things in a numerous family ; and this system, joined to a profound peace on the cessation of the sanguinary war with the Tatars, may easily account for the rapid increase. The population continued to multiply in the same proportion till the year 1792, since which it has gradually declined, and is now considered to advance only at the rate of one per cent. per annum. This may be partly traced to the increase of emigration, but must be in the main attributed to the introduction and rapid consumption of opium ; nor will this devastation appear wonderful when it is considered that for the last twenty years the average importation has been 1,815,458 pounds per annum, that two or three drachms consumed daily is sufficient in ten or at most fifteen years to destroy the strongest man, and that the ashes of the drug thus fatally inhaled by the rich may be resold to the poor and swallowed with equal effect. The usual dose of opium for a beginner is from ten to twenty grains, which being inhaled or swallowed produces in a short time the wild but transitory delirium for which they are willing to sacrifice fortune, health, and even life. While under the effects of the drug the whole frame is violently agitated, the pulse accelerated, and the general heat of the body increased, the breath quick and sudden, the eyes bright and restless, and in short every vital function excited to the highest degree ; a corresponding effect takes place upon the mind ; a delirium of pleasure

is produced, accompanied by the wildest flights of fancy ; and the dread of punishment, the misery of the past, and the darkness of the future, are all forgotten in the mad enjoyment of the moment : even after the short gleam of happiness is past, and the sad reality of misery before them, so dear is its memory, that no extent of fear or punishment will induce them to betray the residence of the dealer. This state of excitement is shortly succeeded by a corresponding depression, the pulse becomes slow and feeble, accompanied by a pitiable languor and exhaustion of spirits ; in this state they eagerly return to the cause of their suffering, and strive to drown the extent of their pain by increasing their daily quantum of the fatal drug. The rapid growth of the habit compels them to augment their dose to one or two or sometimes four drachms a day ; an opium eater to such extent may be distinguished at the first glance from all others of his fellow men. He no longer seeks his paregoric as the means of pleasure but as a refuge from misery ; the primary excitement is now little less terrible than the reaction ; his fancy is clothed with frightful visions, spectres and phantoms accompany him in every movement, and knowing himself an object of scorn and loathing, he yet dreads to be alone ; a frightful pallidness is spread over his face ; every fibre of his frame trembles with irrecoverable palsy ; he is devoured by hunger, which he has no means to satisfy, and by thirst which he dares not quench, for water would produce a spasm too violent for life ; in this state the wretched victims of intemperance crowd around the doors of the merciless dealers, imploring the means of oblivion, and seeming like lost spirits sent back to warn their fellows from destruction. At length when hunger, thirst, and pain have done their worst, they sink into the grave, and enter a world where, if it were true that mere earthly suffering alone can atone for earthly sin, a state of unmixed happiness would be their lot.

For a connected statement of the facts as they occurred we refer our readers to the *Oriental Herald* for September, 1839.

ART. VII.—1. *Tausend und eine Nacht. Arabische Erzählungen, zum Erstenmale aus den arabischen Urtext treu übersezt, von Dr. Gustav. Weil. Herausgegeben und mit einer Vorhalle, August Lewald, mit 2000 Bildern und Vignetten, von*

- F. Gross. Erster Band. Stuttgart. Pforzheim. 1838.

 4. *Essai sur Les Fables Indiennes et sur leur Introduction en Europe*, par A. Loiseleur Deslongchamps. Paris. 1838.

THE singular fate of the interesting collection of tales which we now offer to the reader's consideration may afford an instance as well as a warning of the dangerous results likely to spring from too hasty and immediate a judgment upon novelties, formed, if we may so say, *à priori*, and upon the strange ground that they do not perfectly square with our received impressions and favourite prepossessions upon points more or less unknown. Invest as we will the arguments used by the learned of the most recent times and of our own, with all the pomp and circumstance of great names and widely varied acquisitions, still, in as much as our knowledge at the present day is so confessedly limited upon many portions of the past, the arguments we allude to come at best to no more than this, that because our ignorance precludes certainty it necessitates doubt, and that what we thus doubt we ought to deny, and what we deny we ought to discard.

This chain of reasoning, apparently so close, might and would be perfectly correct if only the basis were established:—if it was formed on our positive knowledge, and not on our confessedly imperfect information; but based, as it is, on the last alone, every step of the argument leads us but farther from the truth; for the truth, or the knowledge of truth, has yet to be discovered: and the proposition, therefore, is in all such cases only a string of utterly groundless assumptions.

Acting upon it then, as the learned have of late been too much accustomed to do, it is not to be wondered at that they have remained for so long a time comparatively stationary in their researches after the hidden things of

antiquity; that they are as far as ever, in spite of their hieroglyphical labours, from lifting the veil of the Egyptian Isis in the West, or taking from the Parsee of the East that mystic covering which conceals or disguises the real utterance of his religious language. The mysteries of both systems, as of many others, doubtless involve a vast mass of fanciful and monstrous absurdity, but we are strongly tempted to believe that they also include and preserve enough of religious faith and historical fact to repay amply the labour of bringing the whole to light.

The scepticism, which on a bolder, more erudite and elaborate, as well as a more recondite scale, has thrown aside the once vaunted and still really important discovery of volumes like the Zendavesta, the Dabistan, the Deshotoor, &c. and founded its objections upon names as referring, like the Akteristan, to stars and not to earth;—to languages as approximating to but not identical with any one with which we are at present acquainted;—to sacred or prophetic personages unrecognizable by ourselves to this hour; has certainly been ably sustained; and with a power of ingenuity and a range of learning in their champions that serves as a fair, though the only, excuse for admitting their validity. There are men whose mental powers and general attainments are of so gigantic a character and possess so preponderating an influence, that they have a right not only to be heard, but to be heard with an absolute prepossession in their favour. The world at large has neither the time, the information, the inclination, nor the ability to undertake a revision of their arguments or to dissent from their conclusions, and must be satisfied to walk with submissive faith in the creed of the more enlightened; to observe the path, and not trample on the flowers and fruits that have rewarded the care, labour, and science, of philosophical cultivators in so ungrateful a field.

But with all this due and indispensable reverence for authority, a time must come when it will be called in question, and by those even who were the foremost to bow before its dicta. When it is discovered that science, so far advanced, cannot proceed; that inquiry, however general, recoils upon itself; that the cup of knowledge, however inspiring, contains but dregs at the bottom, we are apt to feel a doubt whether purer matter does not still remain overlooked in the goblet; whether recoil is not produced by the insufficiency of the instrument; whether the further door of science is not barred by her own accumulations. Perhaps a few magic sounds, a simple though strange incantation, or even the more vulgar labours of the

* The Thousand and One Nights, commonly called, in England, the Arabian Nights' Entertainments. A new translation from the Arabic, with copious notes. By Edward William Lane, author of "The Modern Egyptians." Illustrated by many hundred engravings on wood, from original designs by William Harvey: in three volumes. Vol. I. London: Charles Knight and Co., Ludgate-street. 1839.

spade, may clear away the rubbish that conceals the entrance of the mystic grot; and the Aladdeens and even the one-eyed Fakereers of Philology may penetrate to the scenes and sense of rites of abomination, or load themselves with the boundless treasure of historic gems and pearls,—fitter offering for Princesses of China than the lethargic opiates of John Company and his crew.

If the scepticisms we refer to are more bold and more recondite, those of the case actually before us, as more general in their nature and affecting a point of popular feeling, are more likely to lead, and in fact have led, to the recoil which is just beginning to be felt by the public mind. When the "Thousand and One tales" were introduced to Europe by Galland they were at once pronounced ridiculous, improbable, unnatural; not mere exaggerations, but absolute dreams of the distempered fancy of the East, presenting, like other dreams, shapes of glory indeed, but, from monstrous combinations and impossible changes, mocking all powers of analysis, and leaving only their vague and confused impressions on the pulse of manhood and in the light of day. Europe, still ignorant of the East to this hour, professed at that time to know it better than it was known to its own children. Two centuries have scarcely dissipated the illusion then so rife, when the ingenious translator who had even adapted, in salutary dread, his labours to the taste of his native country and the Western world, was at once set down as an able impostor, ridiculed for his presumed ignorance, and persecuted with jesting malice. The truth of the scenes, however, and the nature and simplicity displayed in the characters, won their gradual way into the bosom of the multitude; and the child who had been lulled with visions of imaginary gorgeousness and facilities of unbounded power during sleep, remembered in his waking, and even his matured moments, the sympathies that had won his spirit and the facts that had interested his reason. A taste had been created, a feeling infused in his infancy, which grew with his growth and strengthened with the strength of subsequent gradual information; and though the world and its sterner realities called him away from these idle indulgences, mocked at its gentler phantasies, and precluded all relapse, still so closely were they associated with the hours and enjoyments of boyhood, that the father heard them referred to by his children with scarcely suppressed pleasure, and felt that, like the buried grain, their banishment to the nursery had given them root and produce a hundred fold.

In proportion to the increase of our Orien-

tal intercourse the interest of the tales increased. They were found to convey a more perfect picture of manners than the works of any traveller however accomplished and indefatigable, and to comprise in themselves a store of Eastern information, so illustrative of feelings and customs, and so well acclimated in general to the places they assumed to depict, that it was by no means easy to improve them in these respects. The internal evidence was too strong for scepticism, and even before the discovery of any MS. of the Thousand and One, the enlightened of every country had admitted their genuineness.

But now a new question arose; the very MSS. that established their authenticity as Eastern, awakened doubts by their discrepancies as to what country of the East could have originated them. Their manufacture, their immediate manufacture, was obviously that of the spot whence they were brought; but though the web had been woven in Arabia or Egypt, the threads were found also inwrought with the tissues of Hindostan, and the richest hues were undoubtedly Persian. Amongst a crowd of minor conjectures two parties were speedily formed, and the lists were graced by the two mightiest Champions of learned Europe, the *Dii Majores* of Historical language and Traditions. The acute ingenuity, profound research, enlarged learning, and scholastic accuracy of Silvester de Sacy, traced, even to the minutest shades of correspondence and corroboration, the mode and manner of the Tales to their proper Arabian sources. The array of his facts, their causes, and coincidences, it was idle and impossible to deny; but it was possible to doubt the general conclusion, and the shield of this scepticism was in the hands of Von Hammer. With less of minuteness in details, or less perfect familiarity perhaps with language, less accuracy of general thought, and certainly less intimacy with Arabia than his justly-renowned and thus far unrivalled antagonist, the Orientalist of Vienna possessed an even wider range of languages, a freer survey of tradition, and, singly worth all other qualifications, a bolder spirit of thought. Bound by the ties of assumed descent for his nation from the tribes of the Caucasus and the Caspian Sea, Von Hammer has ever loved with filial reverence to trace the seats, the rites, the destinies, and the claims of his Indo-German ancestors. If such investigations have, as asserted, sometimes led him into errors, these were venial and trifling; more trifling we venture to affirm than most of those embraced by the general opponents of his lucubrations, and, so far as we ourselves have been able to ex-

amine, much of his apparently wilder speculations have been strengthened, if not absolutely established, by the arguments of his adversaries; amongst such we would particularly specify Simkowsky. We may be pardoned for digressing so far as to observe that Von Hammer himself has not always been aware of his advantages; but in various instances where he himself has frankly abandoned the field to his antagonist, the very reasoning that procured a slight triumph to the latter would have overthrown him altogether.

To return: respecting the specific origin of the Arabian Nights' Entertainments, which Galland loosely says were written by some unknown Arabian author, Von Hammer considers that they originated, like the fables of Pilpay, from India by way of Persia. He founds his theory partly on internal evidence; such as the intervention of Genies of Indian character; traces of Indian customs and manners, and the Indian or Persian origin of some of the names; but chiefly from a passage of Masoudi, an Arabian writer of high authority, who wrote A. D. 942, and who, referring to certain fables or romances, likens them to some which he says have recently been translated into Arabic from the Persian, Indian, and Greek languages, amongst which he mentions "Sindbad," and the work entitled One Thousand Tales, commonly called One Thousand Nights, containing the history of the King, the Vizier, and the Vizier's daughter, and her nurse; the names of the two latter being Shirzadeh and Dinarzadeh." M. Von Hammer observes, in confirmation of his theory, that, under the Caliph Haroun Alraschid and his sons, Ameen and Maimoun (towards the close of the eighth and beginning of the ninth century,) Arabian literature was enriched by the translation of a vast number of Greek, Persian, and Indian works. He supposes that the collection in question underwent many changes and sophistications, in passing through the hands of so many Arabian writers.

The theory of the learned Baron de Sacy affirms that the tales exhibit a complete picture of the customs, laws, and manners of the courts of Bagdad and Cairo; that the original work is written in the vulgar dialect of Arabic, in a style which discovers all the traces of decay, and betrays a modern publication, of which Egypt was the country; that the Genii are the bad spirits of the Mohammedan creed; and with respect to the passage in Masoudi, who lived some years before Cairo was built, if it be genuine, which he doubts, all that can be inferred from it is, that there existed, under the title

of the Thousand Tales, a work with which we are now unacquainted, originally Persian or Indian, which was translated into Arabic, and from which the author of the Arabian Nights' Entertainments borrowed, perhaps, the names of his principal characters. He is of opinion that the work under consideration was originally written in Syria, in the vulgar dialect; that it was left incomplete by the author, and perfected and augmented by later writers; that the more recent tales were added at different periods, and perhaps in different countries, but chiefly in Egypt; and that the only fact that can be affirmed respecting the age of this collection is that it is not very old, as its language proves; but still that, when edited, the use of tobacco and coffee was unknown, since there is no allusion to either in the work.

A summary of some notices previously made may not be wholly unacceptable to the reader, or misplaced here.

The Voyages of Sindbad are the subject of a very erudite dissertation by Hole, who has not unaptly entitled this portion of the Thousand and One Nights, the Arabian Odyssey, as it seems, "if small things may be compared with great," to bear the same resemblance to that performance as an Oriental mosque to a Grecian temple. For his very ingenious arguments and deductions the reader is referred to Hole's work, but a singular poem which has escaped his notice, contains some highly curious coincidences with these voyages and with some other portions of the Arabian Nights. They tend at the same time to prove the antiquity of these particular stories, as it is improbable that the eastern story-tellers should have been indebted to the writer of a German metrical romance of the twelfth century. The romance alluded to is Duke Ernest of Bavaria. It was composed in German Rhyme by Henry of Veldeck, who flourished about 1160; and a Latin poem on the same subject, by one Odo, appeared about the same time. A prose version of the outlines of the story is still popular in Germany. In this singular romance we find the æronautic excursion in the second voyage of Sindbad, with no material variation; the pigmies and cranes as well as the adventure borrowed from the Odyssey in the third voyage, and the subterraneous voyage in the sixth. We have likewise the magnetic mountain, occurring in the story of the Third Calender, which has also been transplanted into the miraculous legend of the Irish Saint, Brandanus.

The striking identity in the story of Camaralzaman with one in the popular romance of Peter of Provence and the fair Maguelone, has been pointed out by the French trans-

lator, and affords another proof how much the *trouveurs* of France were indebted to the Arabian novelists. The tale of the Sleeper Awakened is evidently the foundation of those European anecdotes which suggested to Shakspeare the induction to the *Taming of the Shrew*. One of the most self-evident coincidences is the Enchanted Horse, which was evidently the original of the Brazen Horse of Chaucer; of that by means of which Pierre carried off the fair Maguelone; and, finally, of the Clavileno of Cervantes. Hole also pointed out the similitude "of the mirror which discovers secret machinations and future events, and of the ring which reveals the language of birds," in Chaucer's *Squire's Tale*, with the ivory perspective glass, which occurs in the story of the *Peri Banou*, and the merchant gifted with the speech of birds in the fable of the Ass, the Ox, and the Labourer. Similar magic mirrors and rings occur in several Asiatic and European romances; and the acquirement of the language of birds in particular, which perhaps originated in this science being attributed to Solomon in the Koran, was a favourite fiction in the middle ages. In the same manner the travelling carpet in the story of the *Peri Banou*, which is likewise founded on the wonders attributed to Solomon by the Mahomedans, was introduced into the French romance of *Richard sans peur*, as has been remarked by a former editor of the *Arabian Nights*. It also immediately brings to our mind the wishing-cap of *Fortunatus*, a romance which bears strong marks of an Oriental origin. A wishing-rod of rather a different nature occurs in the ancient German romance of the *Nibelungen*, and is also mentioned in a Teutonic glossary of the ninth or tenth century.

Hole also pointed out the origin of two stories; that of *Bedreddin*, founded on a very ancient story in *Nella-Rajah*, inserted in *Kindersley's Specimens of Indian Literature*; and that of *Alnaschar*, evidently founded on a fable in the *Hitopadeesa*.

We have already expressed our own conviction that the celebrity of *Ferdousi* in the ninth century introduced much of the chivalry of the East into Europe at the Crusades, and accounts for much that is found in the kindred genius and themes of *Ariosto* himself. But it is, we conceive, equally unquestionable that, as we observed in the article just alluded to, (*F. Q. R. No. 45, German Literature*), the tribes of the East when migrating to Europe introduced with their arms their traditions also, the same which had afforded a basis to the work of the great Persian poet and to his predecessors. The songs, in fact, of the Tatars are everywhere

paralleled in antiquity wherever its traces appear; and thus the sole difficulty of this opinion vanishes, since we find that the Arabs conserved to a late period and with singular care as to fidelity of tradition, not admitting the change of even a single letter of the narrative, the succession of oral historians or reciters, by them called *Rouwah*, (see *F. Q. R. No. 39*), and who, like the minstrels of Europe, and the *Usi*, *Kavi*, *Aoidoi*, *Nabathi*, &c. of other lands, were especially devoted to historical narration.

Thus in the story of *Sindbad*, many of the incidents which are attributed to the Greeks were undoubtedly borrowed by them from Persia; and the fabulous deduction assuredly sprung from an historical fact. Thus, as noted on a former occasion, the Old Man of the Sea, simply signifies the chief (*sar*) of the sea or lake, (*yangi*), i. e., of the coast;—and there is no greater perversion in the translation than in that of *sheikh*, used sometimes as chief, sometimes as old man, or elder, (so too our *eoldermann*) as in patriarchal countries. The same compound word, *sar-yangi*, is obviously the name preserved by *Arrian*, and *Quintus Curtius*, as *Zarangæ*, a *Scytho-Persic* tribe. This singular identity is established by the fact that the *Avari*, or *shepherds*, of our Indian frontier, *Scyths* also, are in a vulgar tradition represented as riding upon the conquered inhabitants; while the *buskin*, mentioned (if we remember rightly, by *Herodotus*) as the appendage of the *Scythian* tribes, at once explains the phantasy of the leather legs of these man-bestriding Ancients.

Various similar affinities, explainable only by the older Persian language, and but partially so by the Sanscrit, go far to prove, we submit, that the origin of the tales and traditions that have for so many centuries astonished and amused Europe may be sought for in Persia alone; and that the *deevs* or magicians, the instructors of these last, were not *Brahmins*, we have repeatedly intimated as our opinion; however they may have become possessed of the *primæval* abodes, if such they were, (and it is scarcely a question but that they were not,) together with the language of their predecessors. Our suspicions, and those of others, borne out by the remarkable absence of all historical documents amongst the *Brahmins*, are even more strongly confirmed by the recent fact stated in *Col. Tod's* volume lately published, and which is too extraordinary to be passed over here.

We insisted, in the article referred to, (*Tamil MSS. No. 37, April, 1837*), on the peculiarity that the *Brahmins* had no history, and that they were careful to destroy all

such records of others as came in their way. We noticed, at the same time, the singular contrast afforded by the Jains, who carefully preserved every paper that fell in their way: a course imitated by the Mahomedans also; for many of the Arabian customs are traceable to Persia and Hindostan. This struggle between the Conservatives and Destructives of Indian literature, is accounted for by the Jains, with every appearance of probability, by the statement that the Brahmins who superseded them endeavoured to destroy the evidences of their prior possession and antiquity. Colonel Tod develops a fact which, even in its outline, supports their assertion; for he discovered at Anhulwarra an immense library preserved by the Jains with the greatest secrecy in subterranean chambers. In quoting the passage we shall merely remark that the discovery seems to have been scarce fairly appreciated by the concluding observation.

"It is contained in subterranean apartments in that quarter of the new town which has appropriately received the name of Anhulwarra. Its position screened it from the lynx-eyed scrutiny of Alla, when he destroyed all that was destructible in this ancient abode. The collection is the property of the Khartra sect, of which the celebrated Amra and Hema were the *Sripooj*, or primates. This sect, called *Khartra*, or 'the orthodox' (a title conferred by Sidraj, after long theological disputations,) is the most numerous of all the Jain votaries, enumerating at one time no less than eleven hundred disciples, extending from the Indus to Cape Comorin. Though every one, lay or clerical, bearing the name of Khartra, has a property in the library, it is in strict charge of the *Nagar-Seth* and the *Panch*, or chief magistrate and council, of the city, while its immediate superintendence is confided to some Yutis spiritually descended from Hemacharya, the senior of whom has some pretensions to learning. Years before my visit, I had known of its existence from my own Guru, who was equally anxious with myself to place the fact beyond doubt, and on the very day of our arrival, he hastened to 'worship the Bindar.' Although his venerable appearance was quite enough to make the padlocks fly open, nothing could be done without the *fiat* of the *Nagar-Seth*. The council was convened, before whom my Yuti produced his *patravali*, or spiritual pedigree, tracing his descent from Hemacharya himself, which acted like a spell, and he was invited to descend and worship the treasures of ages. The catalogue forms a large volume, and I should fear to hazard my own veracity, or that of my Guru, by giving his estimate, from its contents, of the number of books which filled these chambers. They are carefully packed in cases, filled up with the dust of the *Mugd*, or Caggar-wood, an infallible preservative against insects.

"Until we have some insight into the contents of the subterranean 'bindar,' of Anhulwarra, and a more extended knowledge of the Oswals of Jussulmér, with access to its library, which is equally numerous and probably more select than that of Puttun; above all, until we have formed some acquaintance with the dignitaries of the Jain sect and their learned librarians, we are not in a condition to appreciate the intellectual riches of the Jains, and can only pity the overweening vanity which has prompted the assertion, that the Hindus possess no historical records, and which seeks to quench the spirit of inquiry, by proclaiming such research a vain labour."

The fair inference, however, is that the Jains concealed these treasures in order to save them, as they allege, from their persecutors. It is not therefore just to charge the opponents of Brahminical antiquity with denying the existence of historical records in Hindostan; for no one at all acquainted with the subject could doubt the propensity of the Jains, even before this discovery; but it tells with double force against the Brahmins; for if they, the temporal and spiritual masters of the country, possessed from immemorial time the seats of learning, how comes it they can show nothing to establish their extraordinary claims? Because, and thus alone can we account for the now scarcely questionable fact—because if Hindostan possesses records, these tell against the pretensions of the Brahmins.

If then these claims are inadmissible, the theory which gives the origin of the Thousand and One to the Brahmins is, with Schlegel, erroneous, and confirms in part the suspicions of Von Hammer, that they were Perso-Indian. The whole tendency of our own argument has been that they are properly Persian, or Perso-Deev, carried to India by the Deevs, in Darius's expedition, and there reappearing in the form of the Pancha-Tantra, as recognized by Professor Wilson. Fire worship was introduced into Persia in the reign of Gustasp, or Darius Hystaspes, at latest, and had made but slow progress in his dominions, and none in Tartary and to the East. In Persia it was in truth actively abhorred; and in the reign of Homai, and even of Darius her son, it was clearly any thing but general. How then can there be any objection in the hatred professed for the Fire-worshippers throughout the Thousand and One? The reign of Homai, the Parysatis (Peri-Zadeh) of the Greeks, was distinguished for its illumination; that Princess herself was highly accomplished and a lover of letters, which she herself cultivated; and that the country itself was in a high state of literary civilisation is apparent from the tra-

dition that when her son, or grandson, Darius, was vanquished by the Greeks, and the confused reigns of the Ashkanians ensued, —after 217 years Ardisheer Babegan, the restorer of the ancient line, sought out carefully all the monuments of the national learning and belief, and re-established with due honours the Magi, the preservers of literature.

We are, therefore, fully inclined to admit the probability now insisted on by Baron Von Hammer Purgstall, that early Persia and Homai were the original framers of the 'Thousand and One'; and when we recollect how careful the Arabs of later days must necessarily have been to modify the manners of other countries, otherwise unintelligible to their own excessive nationality, we shall readily comprehend the truth of any arguments for the conversion of foreign scenes and manners into those of Arabia and Egypt.

Nevertheless we must declare our entire and positive conviction that those conversions were not needed to the utmost extent that has been imagined. We are decidedly of opinion that the Arabs, somewhat like the Brahmins, adopted much from others, or else preserved much that had descended to them, in common with the rest of the world, from the most ancient nations. This argument applies to some remarks of Mr. Lane's, to whom we have been less anxious to introduce the reader, from the deserved popularity of his admirable translation and expositions, and which of course have introduced the work into every library. In Mr. Lane's translation we find the King of the Black Islands, and these are four in number, making this statement of his wife's enchantments:—

"The inhabitants of our city were of four classes; Muslims, and Christians and Jews, and Magians; and she transformed them into fish; the white are the Muslims; the red, the Magians; the blue, the Christians; and the yellow, the Jews. She transformed, also, the four islands into four mountains, and placed them around the lake."—*Lane*, part ii. p. 110.

Hereupon Mr. Lane acutely observes:—

"This passage deserves particular notice, as being one of those which assist us to form some opinion respecting the period when the present work was composed or compiled. It is the same in all the copies of the original work that I have seen, and bears strong evidence of having been written subsequently to the commencement of the eighth century of the Flight, or fourteenth of our era, at which period, it appears, the Christians and Jews were first compelled to distinguish themselves by wearing, respectively, blue and yellow turbans, in accordance with an

order issued by the Sultán of Egypt, Mohammad Ibn Kala-oon.* Thus the white turban became peculiar to the Muslims.—An eminent German critic has been unfortunate in selecting the incident of the four fish as affording an argument in favour of his opinion that the Tales of a Thousand and One Nights are of Indian origin, on the mere ground that the same word (*varna*) is used in Sanscrit to signify both 'colour' and 'caste.' —Part iii. p. 135.

Again:—

"The tale here presents another remarkable anachronism. The title of 'Sultán' was first borne by Mahmood Ibn Sabuktekeen, in the year of the Flight 393, just two hundred years after the death of Hároon Er-Rasheed; and there was no Sultán of Egypt until the year of the Flight 567; the first being the famous Saláh ed-Deen, or Saladdin. It appears, then, that there must have been a long series of Sultáns in Egypt before the period of the composition of this work; for otherwise the author could not have supposed that there was one contemporary with Er-Rasheed.

"I have now given several data upon which to found a reasonable opinion as to the age when these tales were composed. First, in Note 55 to Chapter ii., I have shown that a fiction in one of the tales is framed in accordance with the distinction of Muslims, Christians, and Jews, by the colours of their turbans, which mode of distinction originated in the beginning of the eighth century of the Flight. Secondly, in the present note, I have given a strong reason for concluding that there must have been a long series of Sultáns in Egypt before the age of the author. In the third place, I must remark, that all the events described in this work are said to have happened in ages which, with respect to that of the author, were *ancient*, being related to an ancient king; from which I think we may infer the author's age to have been at least two centuries posterior to the period mentioned in the first of these data. Fourthly, in Note 22 to Chapter iii., I have shown that the state of manners and morals described in many of these tales agrees, in a most important point of view, with the manners and morals of the Arabs at the commencement of the tenth century of the Flight. This I regard as an argument of great weight, and especially satisfactory as agreeing with the inference just before drawn. Fifthly, from what I have stated in the note immediately preceding, I incline to the opinion that few copies of this work, if any, were written until after the conquest of Egypt by the Turks: in other words, that the work was perhaps composed shortly before the year 1517 of our era; but more probably, within ten or twenty years *after*. This opinion, it should be remarked, respects especially the *early* portion of the work, which

* El Makreezee and El-Is-hákee.

is the least likely to have been interpolated, as later parts evidently have been. At the last mentioned period, a native of Cairo (and such I believe to have been the author of the principal portion of the work, if not of the whole) might, if about forty years of age, retain a sufficient recollection of the later Memlook Sultáns and of their ministers to describe his kings and courts without the necessity of consulting the writings of historians, which, probably, he was unable to do; for from his ignorance of chronology, it appears that his knowledge of former times was not derived from the perusal of any regular record, but only from traditions or from works like the present. As I proceed with my translation I shall frequently have occasion to revert to this subject, and may perhaps be enabled to form a more precise opinion than the one which I have here expressed. I should have delayed the insertion of the foregoing remarks, had I not considered it a point of some importance to suggest to the reader, as early as possible, that the manners and customs, and in general even the dresses and dwellings, described in most of the present tales, are those of a very late period. The lax state of morals which appears to have prevailed among the Arabs in the time of our author, probably continued at least until the period when coffee became a common beverage, about the middle of the tenth century of the Flight (or near the middle of the sixteenth century of our era,) and perhaps considerably later, until some years after the introduction of tobacco into the East."—Part v. pp. 307, 308.

However disposed to praise the ingenuity of Mr. Lane, we are far from making so light as he does of Schlegel's suggestion, and are equally convinced of its felicity and probability. The word *varna*, or *pharna*, (varnish?) is however not peculiar to the Sanscrit, and is to be found in the common dialects also. But the division into four castes was not confined to Hindostan: it prevailed equally in Persia, in the reign of Giamshid, *i. e.* the Noachidæ, and in Chaldæa, and amongst the Sabæans and Nabathæans also. White, as purity, was worn by the priesthood in Persia, as among the Moslems of the present day: the red is evidently of the warrior class; it was the distinguishing colour of the conqueror Tahmaras or Mars, as among the Spartans and English. The reader will recall the remark of Pandarus in the Iliad as to the unpainted blood he had drawn from the Spartan Menelaus. *Gour*, or yellow, signifies also a husbandman, and, as applied to the Jews, an outcast. Inquiry might elucidate the several appropriations. In Hindostan it is remarkable that the four colours specified are those chiefly worn, and it cannot be supposed an Egyptian Caliph's commands would be transferred to the remote

East, and adopted by an unchanging race. It is far more probable that the Arabs adopted a prevailing custom of classification, *mutatis mutandis*, as we know they borrowed the sacred green, Mohammedan, from the Nabathæans.

We shall further observe, that among the old Eastern tribes, as in Tataria to this hour, a tendency to the different primitive colours marks the difference of races: and we need hardly recall, in illustration, to the reader the scene in Ferdousi's Shah Nameh, where the tents of the Persian leaders are distinguished by their particular colours, black, yellow, green ("the colour of the Pure,") and red: the well-known distinctions of the black and the white banners of the caliphs originated in Persia, from their families; and districts; as the Kara-bagh, still bear the denominations of colour.

If the four colours were, as we imagine, symbolic of the four classes, or castes, into which society was divided in Persia, they could not have been more appropriately arranged than in the tale, in an order corresponding with the relative estimation of those castes: and it is remarkable that they always throughout the story, though frequently repeated, appear in the same succession precisely. The chance of four colours ranging thus coincidently once is sufficiently small, but the regular adherence to this arrangement seems to mark, as well as their exact number, something far more than casualty, and indeed to render this in the highest degree improbable, and incredulity more extravagant than belief.

The origin of the four castes in India is confessedly unknown; in Persia it is distinctly traced to the Noachidal dynasty, who in inventions, improvements, arts, civilisation, time, and duration of sovereignty, exactly coincide with that period of Persian history personified by the poetry of Ferdousi, as already observed, under the name of Giamshid. This singular coincidence between the only extant narrative of the East, and the historians and writers of the West, can never be too strongly insisted upon. Disguised as facts must be when preserved only through the medium of tradition, we could scarcely hope a more distinct reference through these tales to so remote and unknown an institution in a foreign and ancient land: only the most imperfect and broken hints could by possibility remain; and these warped by the accidents to which we refer. That traditionary history has a decided tendency to turn to the marvellous is obvious from the northern traditions of Thor, and a hundred others, transformed into mere nursery tales even among the

direct descendants of our Scandinavian ancestors, till Jack the Giant Killer, and other infant narratives, are but miniature editions of the Edda: and, since the coincidences in these leave not a doubt of their common origin, why should we reject those of the more obscure East?

It is remarkable too that the tale in question is particularly specified as of *an ancient King* and a physician of *Roum*. Why this should be confined to two or three hundred years, unless to square with another portion of Mr. Lane's hypothesis, we cannot imagine. His version expressly states that "there was in former times, in the country of the Persians, a monarch who was called King Yoonan."

The country then is decidedly established, and the name of Yoonan recalls the ancient race, subsequently known as the polished Ionians of Asia Minor, and bearing still in India that ancient denomination. No scholar can doubt the existence of the Scythian, i. e. Persian or Tatar, race of the Yoni in remote antiquity; no reader, that the names of a tribe and its monarch were continually the same. In the land of Persia, in the time of the Yoni, or their descendants, while the appellation was still given to their king, we there find a regular division of the inhabitants into four colours, and that they were oppressed by a magician. These circumstances strike us forcibly, we must confess, as an incidental confirmation of the formation of the four castes in the early period and place alluded to, i. e. of the Noachidal Giamshid, and Persia. We have seen that in India their origin is unknown.

Mr. Lane's hypothesis would account but for two of the colours; for as to the assumption of white by the Moslems, it is not singular: white is the symbol of the priestly race every where,—but in China. In ancient Persia we learn the distinct historical origination of the custom from Ferdousi.

We know too that the Deev, or Magician race, modified if they did not overturn for a time the ancient system of Persia. In story, such acts are wrought by a single being. The king of the Four Islands (castes?) marries his cousin, a lady of great beauty; such were the Peeris, inhabitants of Ginnistan, near the Caucasian range, the enlightened race with whom Tahmarus and Gustasp successfully contracted alliance. The interest of the story of course requires a lady; the historical fact runs naturally into fanciful distortion after a time. If a king was to be aided against his enemies, he becomes a beautiful princess, a Peri Marjan, to be rescued from hideous Gins.

The Deevs or Sages, ancient, enlightened, were called Peer, as well as the lovely fairies, or Peeri. The figurativeness of an oriental language produced this confusion. We have little doubt that the tale is but disguised history, of the intrusion of the Deev race into Persia, requiring the intervention of another sovereign to restore the original state of things.

We are greatly confirmed in this opinion by the story of Habib in the Arabian Tales, where a legend is distinctly preserved, a Persian origin and Persian locality confessed. The Gins settle and intermarry in the dominions of Schal Goase. Is this the Arabic form, Shah al Gawah?—the celebrated Persian blacksmith leader, Gao, or Gawah, at once recurs to the mind. The scene is laid near Caucasus; the monarch is sovereign of the Black Island, like the unhappy half-marble king of the former story, and the Black Island (Kara-bagh, Karakoum, &c. ?) is the chief seat of his power. We find the allurements of women used to impede the hero, near Caucasus, like those of the enchantress Susen, in Ferdousi. We find the favourite Persian number, seven, recur in every thing, seas, roads, &c.: of the roads the hero takes the Fourth. The six islands in the seven seas remind us of the Saca Dwipa, &c. of Indian antiquity, and its climates; tales of Mount Meru confessedly brought down from remotest ages, and of the seat of the ancient Deevs. These six islands too are distinguished by their different colours, black, white, green, yellow, red, and blue, and which had been successively seized, especially the Black Island, by the rebel Abarikaf, the Abari of Kaf, or Scythians of Caucasus. Like the Deevs these monsters are represented as highly civilized; for they refuse to combat with Habib because he is not fully armed. We deem this evidence of coincidences, taken with the preceding, perfectly conclusive as to Persian origination of at least the two tales in question, and their historical development. Were not these Deev conquerors, the Kaianides?

We do not, however, feel the slightest doubt but that the expedition of Habib to rescue the besieged princess, Dorathil-Goase, is merely the partial adaptation to Arabia of a Persian or Tatar exploit in favour of a captive king. Habib is an old Tatar name.

An extract from Mr. Lane will assist our opinion as to colours and origination, and our theory of changes—in Persia, places are designated by different colours, as the Yellow mountain, Black mountain, &c. :—

"One of the two stories which I have extracted from it, that of Táj el-Mulook and

the Lady Dunya, bears apparent indications of a Persian origin; but in their present state, the manners and customs &c. which both exhibit are Arab. The scenes of the events narrated in the story of Táj el-Mulook are in Persia and, probably, in India; but imaginary names appear to be given to the several kingdoms mentioned in it: the kingdom of El-Ard El-Khadra (the Green Country) and El-'Amodeyn (which signifies the Two Columns) is said to include the mountains of Ispahan, and its locality is thereby sufficiently indicated: that of El-Ard El-Beyda (the White Country) I suppose to be in Persia or India: and as to the Islands of Camphor, I fancy we must be content to consider them vaguely as appertaining to India: the country in which 'Azeez and Azeezeh' resided is said to have been near to the Islands of Camphor; but their story is perfectly Arab."

As to the title of Sultan, it would surely suffice to have prevailed in Egypt, for an author so ignorant as to place Sultans there in El Rashid's time. It seems strange, too, to tie down an ancient king to about two centuries; why not ten? The manners and morals of the Arabs at a particular time Mr. Lane, from his experience, can doubtless determine far better than most men, but can he point out that they were not borrowed from other nations, and merely preserved, not bestowed by the graphic writer on his tale? All his arguments, we submit, can only bear out the collation and editing, so to say, of the tales; assuredly not, to the best of our judgment, their origin.

We have more than once on this as on former occasions supported our opinions by the testimony of the Arabian historian, Masoudi, and whom in all that relates to Persian antiquity we look upon as utterly unrivalled amongst his countrymen; since, in total ignorance necessarily of much of the traditionary times—if such they really were, which we greatly question—of Persian history, his testimony is ever borne out by the facts, which come one by one, and at long intervals, regarding that primæval country. We are therefore happy to find, in a most able article in the *Athenæum* (No. 572), the extract of a passage from that valuable writer which is not usually met with in his works; which, though regarded by some as an interpolation in one copy, could yet hardly have been extended, and without any object, to a second; which confirms the impression of Von Hammer as to the Persian origin of the Thousand and One; and which finally is itself confirmed by the recent discovery of that learned German. We quote the passage.

"These, and other particulars, may be

read in the work of Ubeyd Ibn Shooyah, which is in everybody's hands, and has acquired great celebrity; although, it is true, that persons versed in these matters all agree in opinion that these accounts are taken from books of tales and fables composed by men, who by learning them by heart, and reciting them in the presence of their sovereigns, tried to insinuate themselves in their favour, and rise in honour and command. In one word, that they are similar to those books imported among us, and translated into Arabic from the Persian, Hindostanee and Greek languages, and the composition of which has the same origin as we have already shown. As, for instance, the book entitled 'Hezar Efsaneh,' which means in Arabic the book of the thousand tales, for *efsaneh* in Persian has the same meaning as our word *kharafah* in Arabic,—that is to say, a tale, a pleasant and amusing story. This book (the 'Hezar Efsaneh') is commonly called among us the book of 'The One Thousand and One Nights,' and it contains the adventures of a king and his vizier,* as well as those of his daughter (the vizier's) and her nurse; the names of these two being Shir-ázád and Duniázád. Another book of this kind, is that of *Wiredah†* and *Shimás*, in which the adventures of certain kings of India with their viziers, are related; the book of Sindabád, and many others of the same kind."—*Athenæum*, Oct. 13, 1838, p. 738.

Masoudi wrote about the 330th Hegira, A. D. 942; but of course it is not to be imagined that the Hezar Efsaneh, even if the undoubted labour or compilation of Queen Homai, and therefore subsisting for above 1200 years, could possibly be the same as any present MS. of the Arabian Nights' Entertainments. Yet the introductory tale as noticed, in Masoudi, differs little from that in our present version. And the story of Sindabad is found in the Calcutta edition exhibited at the head of this article, and also in Torrens's translation. Still, generally speaking, not only most names, but also scenes and customs, have undergone very considerable change in the transfer, and according to the fancies of reciters for the people, who were certainly not so faithful as the historical Rouwah, or Oral historians; and in forgetting, rejecting, embellishing, or adding to the various narratives, without any transcript to verify the original stories, thus abandoned to the license of hundreds and thousands of those reciters, they must have inevitably assumed a totally different aspect from what they were before reduced to writ-

* Another copy of Masoudi, omitting the vizier, would seem to make Sheherzade this king's daughter.

† In some copies of Masoudi this name is Jilkund.

ing. This art, it is true, existed long before Mahommed in Arabia, but only among the learned; insomuch that the very historical traditions we have alluded to were only committed to paper in the reign of the celebrated Haroun. The "Thousand and One" then would of course assume a far later date and only after the major points of costume and manners were hopelessly altered to Arabic; though the introductory narrative, retaining the original Persian names, as given by Masoudi, indicates, we think, beyond a question and unsuspectingly, the native country of the collection. That such tales existed in Persia long before Arabia, is proved by the dread expressed by Mahommed of their influence over his Arabs: but even supposing that in the times of Mansour, Rashid, or Maimoun, a direct translation had been made by the sovereign's command of the fascinating Persian abomination, the paucity and antiquity of such copies, together with the ravages of the Caliphs' libraries, would leave not a hope of obtaining these undiluted translations. On the other hand foreign scenes and manners, that would not be readily understood by the unlettered, idle and impatient audiences of Arabian coffee-houses, would compel the Maddah to stop every instant to explain their bearing, and destroy their interest and his own with the public. Thus too the novels of Scott, one at least of which we are told by a recent traveller he heard recited in that land as an *Arabian Nights'* Entertainment, must undergo complete alteration in the process, and soon become unrecognizable at home.

These objections, we submit, are quite as probable as the general theories of De Sacy and Lane: and if any doubt exist, we refer directly to the story-tellers of Hindostan, the costumes and circumstances of whose narratives differ perpetually from those of Arabia, even when the ground-work is the same, and from the same obvious necessity of rendering the tale intelligible to the immediate hearers. We have noticed too at times that the same tale, in the mouth of the same speaker, has more than once lost its principal attributes, and assumed others totally foreign, while no efforts sufficed to recall the lapsed passages to the treacherous memory of the speaker; neither dread of anger nor hope of reward.

Tales among early and ignorant nations would be of native not foreign growth; of native traditions or histories, and native names of course. They who borrowed the tales, as the Arabians certainly did, would yet adapt the costumes to their own habits in order to become intelligible at home, which would not be the case with the names. We

submit, therefore, in direct converse of De Sacy, that the names have been preserved, not borrowed,—which would be unnecessary—and the locality and manners gradually and necessarily changed.

The German edition at the head of our article is taken from a MS. of evidently doubtful authenticity, if we may so apply the term; for it contains on the thirteenth, fourteenth, and subsequent nights, the story of The Forty Viziers, Sheikh Chehab-edeem, &c., usually included in the Turkish tales. The verses throughout are closely and carefully given, but in these also the original is defective. A slight preface, of little pretension to acumen or novel information, gives an outline of Galland's biography. The extreme beauty and spirit of the numerous wood-cuts is the chief merit of this work, and they are such, as even alone, to render it a desideratum; the typography is also of a high order.

Mr. Lane's edition is universally known; its illustrations are so exquisite, and so wildly fanciful, appearing absolutely as the very dreams of the reader's own imagination spontaneously wrought into shape, and fantastically weaving them adown the margin as he reads the tale, that it is difficult to imagine a more pleasing or more perfect delusion than the graceful forms into which the pencil is running, constantly giving to unformed and embryo conception, the force and finish of reality. But of the notes that follow and illustrate every chapter, and which constitute the real value of the book, it is impossible to speak too highly. The learned editor's intimate knowledge of Arabian manners, feelings, and prejudices; his thorough acquaintance with the language and character of the natives; the facilities of communication he possessed with the latter, during his long sojourn in Egypt: and the just confidence he has won by his Description of its Modern State, all combine to render him the fittest perhaps of any man living for the task he has so ably executed: it would seem as if the work and the translator were made expressly for each other; and henceforth only those who would be ignorant of the *Arabian Nights*, can be ignorant of Mr. Lane's annotations.

The felicity with which the oriental style has been preserved throughout this translation is another of its singular merits; it is always imaginative yet always simple, so as to impress the reader with the character of the original, but never to fatigue his patience nor outrage his better taste; for it has no affectation. We become in the perusal half orientalized, and therefore more capable of understanding and enjoying the niceties of

oriental feeling in these oriental tales. The poetry with which they are interspersed throughout, is often exquisitely beautiful; and its delicate turns of thought, and the full, warm glow of Arabian imagination and expression, are given with a happiness and fidelity that leave us only to regret that Mr. Lane should have at all curtailed the original.

The MS. of the Thousand and One, used for this edition, is undoubtedly, from all that has appeared, one of the best extant; and this is obvious in spite of the careful elision of every passage that in Galland's, the usual translation, offends and pains by its oriental grossness. Divested of every indelicacy, these delightful tales now contain nothing that can deter the purest or the most fastidious from perusal: the edition is a public service, not national only because universal, from the universality of the tales. And when it is considered how influential they have been, as we have already pointed out, in and from the very nursery, the effect of this purity upon every class of readers will be easily imagined.

The work of Mr. Torrens is a very close translation of the Calcutta edition, published from, in our opinion, the best MS. of the Thousand and One that is yet known, for the MSS. of this work in the British Museum do not seem to have attracted the attention they deserve. They are far superior to the Breslau. From its extreme fidelity, therefore, as well as from the value of the original, this work is an acquisition to the libraries of the curious. Almost every word is preserved, but the offensive portions are sufficiently modified to be divested of their indecency. The reader is consequently let into some curious particulars, one or two of which we shall notice as we proceed. The poetry is preserved entire, but, unlike Mr. Lane's, is unfortunately rendered into verse, and this by no means of the best order, generally speaking; its style, in fact, is so utterly European and English, to say nothing of namby-pamby, as not only to obscure the original verse continually, but also to break up all the Eastern associations of the really literal prose with a singularly disagreeable effect. It is entirely out of place, out of taste, and out of character; and we trust in the next edition to see it restored to prose like Mr. Lane's. We say like Mr. Lane's, for in general Mr. Torrens' prose is antiquated and quaint, not to say uncouth. With all these faults, and they are easily corrected, the work is valuable; and for the Arabian Nights as they are really written the curious and scientific must recur to Mr. Torrens' translation.

While on this subject we must again notice that the names of Shuhurzad and Dunyazad, as given by Masoudi, are preserved in this version (the Calcutta MS.) and that the story of King Sindabad is also contained in it, though it does not appear in Mr. Lane's edition: this coincidence may go some way to connect the existing collections with the old Persian *Hezar Efsaneh*, or Thousand and One. To return to an idea we threw out near the beginning of this article, it will be singular if the influence of these popular but fanciful tales should lead learned curiosity to examine the authenticity of more serious and recondite works with greater closeness than heretofore.

We cannot quit this point of antiquity without observing that much very curious matter regarding Oriental antiquity may be anticipated from the book of *Fahrest*, the most ancient History of Arabian Literature, dated about A. D. 980, and of which the great oriental biographer, *Hadgi-Chalfo*, knew only the table of contents.

Regarding this work we particularly observe that one of the sections at least turns almost entirely upon the now unknown doctrines of the Nabathæans, the undoubted authors of the famed works on Hermetic philosophy, so long lost to the world; and the recovery of which would probably supply the grand data of Egyptian and other antiquity. In the section alluded to we notice among other, though less interesting, matter, a portion referring to "the Calling of the Jews." It would be curious to learn how profane antiquity regarded that important and mysterious event.

The two last books of the *Fahrest* contain also an account of the different sects and religions, particularly the Manichæans and the Nabathæans, their festivals, chiefs, and literature.

As a pendant to the foregoing we may observe, that among the notices of books in the possession of the late Jonathan Duncan, Esq., of Bombay, appears one of "Four Books of the Sabæans." We trust efforts will be made to recover this MS. in spite of the general scepticism that exists as to the value and antiquity of similar remains. Till such are fairly examined, and in a less dogmatic tone than prevailed upon former occasions, it will surely be impossible to determine to what discoveries and elucidations their contents may lead.

We have noticed the wide difference of the German edition from the others. In the versions of Lane and Torrens (and little more than the first volume of either of the three is yet published) the stories are nearly the same. Out of the twenty-four

given in the latter gentleman's volume, there are but three, viz. The Bullock and the Ass, King Sundubad, and Oomr Bin Namen and his two Sons, which differ from Mr. Lane's, who gives in their stead, the Husband and the Parrot, Tajel-Mulook and the Lady Dunya, and Azeez and Azezeh. His collection also contains the story of Ala-ed-deen Abu-sh-shá-mat, not in Torrens', but found in Weber's collection, (Vol. ii.) in the Appendix.

Our extracts will be chiefly from two stories; The Three Ladies of Bagdad and the Porter, and Nourreddin and the fair Persian.

Of Mr. Torrens' exactitude we shall give some specimens, and commence appropriately with one of the highest importance to our earliest tastes; a passage fit in every sense for collation by our nursery critics.

"So he lifted the hamper and followed her until she stopped at the shop of a sweetmeat-seller, and she bought an earthen dish, and laid on it of all that was in his shop, either cross barred, or cake sweetmeats, scented with musk, and soapcakes, (!) and lemon drops, and ladies' kisses, and Zee-nab's combs, and ladies' fingers, and of the large sweetmeats called the kazees' mouthfuls, and took of all sorts of sweetmeats, on the dish."—p. 75.

The next passage affords a picture for the lover.

"Then looked the porter for her who opened the gate to the damsel, and lo! she was in stature just five cubits, of prominent and fleshy figure, a very queen of beauty and of elegance, of fairness, and of perfection, and she had hit the very mean of beauty: her forehead glossy, and her face of ruddy hue, and her eyes like to those of the wild cow and the ghuzul, and her eyebrows like the bow of the first day's moon of the month Shuban, and her cheeks like anemones, and her mouth small as the ring of Sooleiman, and her lips red as coral, and her teeth like stringed pearls and the white camomile, and her throat like the antelope's, and her bosom sloping as a penthouse, and her breast like two unripe pomegranates, and her body decked in damask silk; as the poet has said of her:

"Behold the sun, and full orb'd moon
That lighten all this place!
How delicate her chiselled brow,
How cheery bright her face!
Your eyes have never yet beheld
Jet black contrast with white,
As when her forehead and her hair,
In mingled charms unite.
A name peculiar must be found
For loveliness so rare;
Alas for me! ye roseate cheeks!
I have no portion there!

She walked; and still from side to side
She swayed her gracefully;
I laughing watched those jutting hips,
So strangely fair to see!
But gazing on her slender waist
I wept in very fear
To think so delicate a thing
Should such a burthen bear."—pp. 76, 77.

The third lady is thus described.

"And there appeared at their entry a damsel of beaming countenance, and gentle cheerful beauty, and tutored manners, with moon-formed shape, and eyes fraught as with Babylonian witchcraft, and the bows of the eye-brows like the bend of a river, and her stature straight as the letter Alif, and the odour of her breathing as ambergris, and her lips cornelian coloured, sugar sweet, and her face fit to shame the light of the bright sun, and she was even as one of the constellations from on high, or a dome worked with gold, or a bride dressed for her bridegroom, or an Arab maiden not twenty years of age, as the poet sung of her when he said:—

"Or well strung pearls, or frost-white hail,
or blossoms of the camomile
Are what, for so indeed they seem, she
shows us in her smile;
The tressed ringlets of her hair hang down
her shoulders dark as night,
And the glad radiance of her charms might
shame the morning light."—p. 77.

Having given these two specimens of sufficiently indifferent verse to bear out our criticisms, we shall make the reader amends by an extract of extreme simplicity and beauty.

"My soul's whole object center'd lies
In thee, beloved one:
To meet with thee is Paradise;
But oh! eternal agonies
Are mine when thou art gone.
The madness of my love shall last
Till all the days of time be past;
Ne'er will I shame to say,
How love the curtain rent apart
That o'er my maiden face was cast,
How, when affection warmed my heart
He tore my veil away.

"When wilder still my longing grew,
And passion fill'd my breast,
Care round my form her mantle threw,
And then I pined, and then I knew
The reason stood confess'd.
When down my cheeks stream'd many a tear,
My love was told, my secret clear
By evidence of these;
Oh! heal the pangs that I endure!
In thee the bane, and bliss appease,
For whoso trusts to thee for cure
Can never hope for ease.

"Those bright-lash'd eyes have caused my
pain,
And I must yield my breath,

By the cold edge of absence slain :
 How many a prince, like simple swain,
 That blade has done to death !
 Yet ne'er will I my love forego ;
 Love is the only law I know,
 My hope ! my comfort still !
 Ah ! prosperous day, when on thee first
 These eyes their glances chanced to throw :
 Henceforth my heart in love immersed
 Was bondsworn to his will."—pp. 91, 92.

Our worthy friend, the Porter of Bagdad, certainly got into pleasant company, as we knew from the older versions ; but we never suspected that the gaiety was carried so far as we find it now.

"Then the damsel took the cup, and drank it off, and sat down with her sisters, and they ceased not drinking, and the porter in the midst of them ; and they kept on with dance and laugh, and songs and verses, and jingling anagrams ; and the porter was going on with them, with quips, and kisses, and cranks, and tricks, and pinches, and girls' play, and romping ; this one giving him a dainty mouthful, and that one thumping him, and that one slapping his cheeks, and this serving perfumes to him ; and he was with them in the height of joy, even as if he were sitting in the seventh Heaven among the houris of Paradise ; and they stayed not doing after this manner, until the wines played in their heads and in their senses. Now when the wine got the better of them, the portress stood up, and took off some of her upper clothes, and she was unveiled, and she let flow a tress about her, as it were a garment, and she threw herself into the tank, and played with the water, and dived, and jumped up, and took the water in her mouth, and spirted it at the porter."—p. 82.

This is rather an odd amusement for porters in Paradise, and does not square so entirely with the gravity of Oriental manners as we were tempted to imagine : the continuation is still worse.

"So she bathed, and washed herself, and then came out of the water, and sat by the side of the porter, and said, 'Now, my master, now my fine fellow ;' and she asked him a riddle. So the porter said this, and that, and answered impudently, and she said, 'Hallo ! are you not ashamed ?' And she seized him by the neck, and beat him heartily. So he said again in like manner, and she struck him another slap on the back of his neck, and cried, 'How, how, you wretch ! are you not ashamed ?' So he said it again, and she cried, 'Oh you ! have you no shame in your talking ?' So she thumped him with her hand, and beat him. But the porter made a still worse answer, and she set upon him with still greater beating, and said, 'No !' and he said, 'Tis so !' and the porter went on calling what he thought the answer of the riddle, and they beat him the more, and he was in

no other plight than with his neck swelled with blows ; and they laughed more and more among themselves, until he said, 'And what is the answer to the riddle among you women ?'—pp. 82, 83.

The riddle, though omitted by the translator, is evidently none of the most delicate : before it is solved,

"The (second) damsel took off her upper clothes, and cast herself into the tank, and dived and sported about, and bathed : then looked the porter upon her unveiled, as if she were a fragment of the moon, her face like the moon when at the full, and like the dawn when at the brightest ; and he looked on her fair stature, and her shape, and that massive figure that quivered as she went ; and she was unveiled, even as when her mother bore her, and he began to address her extemporaneously :—

'If I thy beauteous form, my fair,
 Should to the date-tree bough compare,
 Sure envious spite 'gainst charms so rare
 Would o'er my heart prevail ;
 The date-tree bough is fairest seen,
 Enveloped in its leafy screen,
 But thou art fairest far, I ween,
 When seen without a veil.'

"Now when the damsel heard his verse, she came up from the tank, and went and sat by his side, and said, 'Now, my master.' And she asked him again the same riddle."—p. 84.

The close of the scene is perfectly in, or rather, out of character.

"Then the cup passed round among them a full hour, until the porter stood up, and went down into the tank ; and they looked at him, swimming in the water, and he bathed in like manner as they did. Then he came up and threw himself among them, and said, 'Now, my mistresses ;' and asked them a riddle : and they all laughed at his riddle, till their heads fell on their shoulders ; and one said, This, and the other, That, and he said 'No,' and took forfeits from each one of them for their foolish answers."—pp. 84, 85.

All this, we imagine, must be quite new to the English reader. Mr. Lane gives us little room to suspect these excesses.

We give an instance of detail from the Calcutta translation, as contrasted with Mr. Lane's, showing the value of the former, as an index of peculiarities.

"Not long after this, the 'Efreet said to the Jinneeyeh, Arise, and place thyself beneath the youth, and let us convey him back, lest the morning overtake us ; for the time is near. So she advanced towards him, and, placing herself beneath his skirt, as he lay asleep, took him up, and flew away with him, in the state in which she found him, clad only in his

shirt, and pursued her flight with the 'Efreet by her side. But God gave permission to some angels to cast at the 'Efreet a shooting star of fire, and he was burnt. The Jinnee-yeh, however, escaped unhurt, and deposited Bedr ed-Deen in the place over which the shooting star had burnt the 'Efreet. She would not pass beyond it, fearing for his safety; and as destiny had appointed, this place was Damascus: so she placed him by one of the gates of this city, and flew away."—*Lane*, p. 280.

"But for what befel in the matter of the Ufreet, surely he said to the female Ufreet, 'Arise, and get in under the youth, and let us take him back to his place, for that the dawn may avise us of its coming, and sure the time is near.' Upon that the female Ufreet came forward, and crept in under his garment skirt, and he sleeping; so she took him, and flew with him, and even as he was, in his under garment, and without upper clothes; and the female Ufreet gave not over flying with him, and the Ufreet vying with her in speed, and the dawn advised them that it was come in the middle of the day, and the Moouzzins called aloud the summons to the Asylum of Good. Then* the Almighty commanded his angels to cast at the Ufreet a meteor of fire; so he was consumed, but the female Ufreet was preserved; and she descended with Budur ood Deen at the place where the meteor smote the Ufreet, and did not go back with him to Bussorah, fearing for his sake. And it so was by the order of God's decree that they arrived at Damascus of Syria, and the female Ufreet laid him down at a gate of the city portals, and flew away."—*Torrens*, pp. 223, 224.

In the story of Noor-ed-deen, Mr. Lane's version omits an amusing incongruity. The chamberlain, who recommends him to fly for his life, observes—"Oh! my master, this is not a time for salutation nor for talking:" which was scarcely doubtful: but in Mr. Torrens' volume this anxious official adds to his previous remark a singular illustration of his own opinion as to the value of time at that moment.

"Oh! my master, this is not the time for greeting, nor for words: listen to what the poet saith;—

"Fly, fly with thy life, if by ill overtaken!
Let thy house speak thy death by its builder
forsaken!
For a land else than this land thou may'st
reach, my brother,
But thy life lost, thou'lt ne'er find in this
world another.
How! who'd live with the roof of his wretch-
edness o'er him,
And the great earth of God broad outspread-
ing before him?"

* These Ufreets, like our own, ought clearly, from this, to have gone home earlier in the morning, and before prayer-time.

When the theme's life and death, to no agent
confide it.

For life cares for itself, as none else does be-
side it.

Ne'er could prowl the grown lion with mane
roughly sweeping,
Did he trust in his need save himself for safe
keeping."—p. 379.

We take a couplet from Mr. Lane to show the superiority of his system of literal and tasteful prose over this crude poetry of his competitor: the thought we conceive exquisitely beautiful in itself, and Mr. Lane's words do it the fullest justice.

"She bade me farewell on the day of separa-
tion, saying, while she wept, from the pain
that it occasioned,
What wilt thou do after my departure?—Say
this, I replied, unto him who will survive
it."—p. 470.

The graceful pathos of this shrouded in-
timation is poorly compensated by the ob-
scurity of the Calcutta translator's rhyme.

"She bade farewell upon our parting day,
And in love's anguish shed full many a tear;
'What wilt thou do?' she cried, 'when I am
away?'
'Ask them,' I said, 'could live, and thou not
here.'"—p. 398.

The whole of the following is, if possible,
in even worse taste.

"Oh, men! will not one true friend 'mongst
you all,
Wail o'er my state, and answer to my call?
The sweets of life, I've e'en in hope foregone,
And Death is near me, with her rattling
groan;
Oh! Thou who didst create the chosen He,
The Guide, chief Intercessor, Mighty Sea
Of Love, the charged with the glad ministry,
Oh! free me, I beseech my fault forego,
And drive far hence, mine evil, and my
woe!"—p. 404.

We shall in justice to Mr. Lane give two
specimens from his notes as evincing his
power of Eastern illustration; the first is
on armour.

"The prophet David is said to have been
the first person who manufactured coats of
mail; and the cause of his applying himself
to the art was this.—'He used to go forth in
disguise; and when he found any people
who knew him not, he approached them
and asked them respecting the conduct of
Dáood (or David), and they praised him
and prayed for him; but one day as he
was asking questions respecting himself
as usual, God sent to him an angel in the
form of a human being, who said, 'An ex-
cellent man were Dáood if he did not take
from the public treasury:'—whereupon the

heart of Dáood was contracted, and he begged of God to render him independent: so He made iron soft to him, and it became in his hands as thread; and he used to sell a coat of mail for four thousand [pieces of money—whether gold or silver is not said], and with part of this he obtained food for himself, and part he gave in alms, and with part he fed his family.—Hence an excellent coat of mail is often called by the Arabs 'Dáoodee,' *i. e.* 'Davidean.' This kind of armour is worn by some Arabs of the Desert in the present day; but the best specimens, I believe, are mostly found in India. Burckhardt mentions one tribe of Arabs who have about twenty-five; another, two hundred; and two others, between thirty and forty. 'The dora [properly *dirā* or *darā*] is,' he remarks, 'of two sorts, one covering the whole body like a long gown from the elbow, over the shoulders, down to the knees: this is the *sirgh*: the other, called *kembáz*, covers the body only to the waist; the arms from the elbows downwards being covered with two pieces of steel, fitting into each other, with iron fingers. Thus clad, the Arab completes his armour by putting on his head an iron cap (*tás*), which is but rarely adorned with feathers. The price of a coat of mail fluctuates from two hundred to fifteen hundred piastres. . . . Those of the best quality are capable of resisting a ball: the coat of mail is sometimes worn within the ordinary outer tunic.'

The second is on a more delicate subject.

"One simple mode of secret conversation or correspondence is by substituting certain letters for other letters.

"Many of the women are said to be adepts in this art, or science, and to convey messages, declarations of love, &c., by means of fruits, flowers, and other emblems. The inability of numbers of females in families to write or read, as well as the difficulty or impossibility frequently existing of conveying written letters, may have given rise to such modes of communication. Lady Mary Wortley Montagu, in one of her charming letters from the East, has gratified our curiosity by a Turkish love-letter of this kind. A specimen of one from an Arab, with its answer, may be here added.—An Arab lover sent to his mistress a fan, a bunch of flowers, a silk tassel, some sugar-candy, and a piece of a chord of a musical instrument; and she returned for answer, a piece of an aloe-plant, three black cumin-seeds, and a piece of a plant used in washing. His communication is thus interpreted. The fan, being called '*mirwahah*,' a word derived from a root which has among its meanings that of 'going to any place in the evening' signified his wish to pay her an evening visit: the flowers that the interview should be in her garden: the tassel being called '*shurrábeh*,' that they should *sharáb* (or wine):

the sugar-candy, being termed '*sukkar nebát*,' and *nebát*, also signifying 'we will pass the night,' denoted his desire to remain in her company until the morning: and the piece of a chord, that they should be entertained by music. The interpretation of her answer is as follows. The piece of an aloe-plant, which is called '*sabbárah*' (from '*sabr*,' which signifies 'patience'—because it will live for many months together without water), implied that he must wait: the three black cumin-seeds explained to him that the period of delay should be three nights: and the plant used in washing informed him that she should then have gone to the bath, and would meet him.—I have omitted one symbol in the lady's answer, as it conveys an allusion not so consistent with European as with Arab notions of female delicacy.

"The language of flowers employed by the Turks does not exactly agree with the system illustrated in the story of '*Azeez and Azezeh*;' for the former consists of a collection of words and phrases or sentences which rhyme with the names of the objects used as the signs. This system is also employed by the Arabs; but I believe not so commonly as the other.

"A remarkable faculty is displayed by some Arabs in catching the meaning of secret signs employed in written communications to them; such signs being often used in political and other intrigues. The following is a curious instance.—The celebrated poet El-Mutaneabee, having written some verses in praise of Káfoor El-Ikhsbee-dee, the independent Governor of Egypt, was obliged to flee, and hide himself in a distant town. Káfoor was informed of his retreat, and desired his secretary to write to him a letter promising him pardon, and commanding him to return; but told the writer at the same time, that when the poet came he would punish him. The secretary was a friend of the poet, and, being obliged to read the letter to the Prince when he had written it, was perplexed how to convey to El-Mutaneabee some indication of the danger that awaited him: he could only venture to do so in the exterior address; and having written this in the usual form, commencing '*In sháa-lláh*' (if it be the will of God) 'this shall arrive,' &c., he put a small mark of reduplication over the '*n*' in the first word, which he thus converted into '*Inna*;' the final vowel being understood. The poet read the letter, and was rejoiced to see a promise of pardon; but on looking a second time at the address, was surprised to observe the mark of reduplication over the '*n*.' Knowing the writer to be his friend, he immediately suspected a secret meaning, and rightly conceived that the sign conveyed an allusion to a passage in the *Cur-án* commencing with the word '*Inna*,' and this he divined to be the following:—'Verily the magistrates are deliberating concerning thee, to put thee to death.' Accordingly, he fled to another town.—Some authors add,

that he wrote a reply, conveying, by a similar sign, to his friend, an allusion to another passage in the Kur-án:—‘We will never enter the country while they remain therein.’—It is probable that signs thus employed were used by many persons to convey allusions to certain words; and such may have been the case in the above-mentioned instance: if not, the poet was indeed a wonderful guesser.”

We regret that we have no space for a detailed examination of the *Essai sur les Fables Indiennes*, such as its own merits, and the deserved celebrity of its author require at our hands. It is, however, a volume of extreme labour, pains, and research, combining all that has been said on the subject with the utmost clearness and accuracy. It is divided into two portions—*Bidpai* and *Sendabad*. This last is not the short tale before noticed as appearing in the *Calcutta* version of the *Arabian Nights*, but the renowned *History of the Seven Wise Masters of Rome* (Roum?) in its original form; and far more likely than that insignificant tale to have been the one noticed, as we have seen, in the *Hezar Efsaneh*, or *Old Persian Thousand and One*.

The fables of *Pilpay* or *Bidpai* have been satisfactorily traced to the Sanscrit *Hetopadesa*, or to its prototype in the same language, the *Pancha Tantra* (Five Chapters,) an Indian work of some antiquity. The *Kalila* and *Dimna*, or the two Jackals; the *Anvari Sohaili*, or *Emanations of the Star Canopus*; the *Ayiari Danush*, or touchstone of Knowledge, are only modern modifications of the fables of *Pilpay*. All these works consist of stories strung together and connected by some leading feature, in the manner of the *Arabian Nights*. The account which the Persians give of *Pilpay's* fables is, that they were invented by King Houshing, the second of the Pishadian dynasty of their monarchs; that a king of India, named *Dabeshelim*, got possession of King Houshing's Will, as it was termed, and had it translated into Sanscrit by a Brahmin named *Bidpai*; that in A. D. 560, *Noushirvan the First*, of the same dynasty, obtained a copy of the work from India, and caused it to be rendered into Pehlivi by the physician *Buzurgomir*; and that on the overthrow of his dynasty and the establishment of the Caliphate at Bagdad, the Pehlivi work was translated into Arabic, whence the modern Persian versions were made. These tales have been discovered in the Hebrew, the Syriac, Greek, and Latin tongues; a Latin translation of the *Kalila* and *Dimna* is extant in print, made by a converted Jew, named *John of Capua*, as he states, from the Hebrew, between the years 1262 and 1278. In his prologue he states

that these tales were originally Indian, that they were translated into Persian, thence into Arabic, thence into Hebrew. It is probable that this Latin *Pilpay* is the source from whence many of the oriental tales met with in Western literature were derived, and even of some tales which have become naturalized in the West and clothed in an European dress. The incidents of *Shylock* and his bond are eventually traced to a Persian tale, the *Cazi of Emessa*; there is also a version of it in *Gladwin's Persian Moonshée*. Professor H. H. Wilson, in his *Analysis of the Pancha Tantra*, observes, that the oriental origin of most of the tales which first roused the inventive faculties of our ancestors is universally admitted.

The notes of M. Deslongchamp's volume are no less interesting than the text, and the whole is a complete library of reference on the subject.

WE have already, and upon more than one occasion, noticed the peculiar characteristics of M. Paul de Kock's novels; and as his genius, gaiety, exactitude and closeness of observation, together with their natural concomitant, diversity of powers, are sufficiently obvious in themselves from the extracts already furnished, (see F. Q. R. Nos. 10 and 20,) we need dilate but little on these topics to the readers of our journal. But there are other considerations, and scarcely less germane to the general question before us, to which we shall request their serious attention for a while.

Life, the great principle of our existence, as few thinking persons require to be informed, is bestowed upon us for the double purpose of thought and action; and since the former is but a continuous preparation for the latter, and itself requires to be fed by a constant supply of subject-matter; and further, as the material on which it feeds ought to assimilate as nearly as possible to

the object of such sustentation, it follows, by synthesis, that novel-reading ought to be the great aim of our thoughts.

Life, indeed, was clearly given to man for two especial purposes—first, to read novels; and secondly, to act them. If, however, there should by possibility be found in this world any one sufficiently hardy to deny, or even sufficiently sceptical to doubt in his secret soul the truth of our axiom,—and the wildest extravagances of imagination do at times enter the human brain:—if then, and we can only admit the case hypothetically, it were possible that such unbeliever could be found, before seeking to enamel him with the unfading hues of truth by the simple operation of the pile and the faggot, after the most approved authorities, and even previous to stamping in persuasion by the arm of flesh, as practised in China, Turkey, England, and all other enlightened countries, we would first point out to his erring judgment that theory and practice are both opposed to his heretical unbelief. In the first place: just as we eat food for the sake of prolonging existence, so we read novels for the sake of enlarging philosophy. We take these, as we take all cudgellings, cuffs and kicks, because they are given us unstintedly, and without our asking for them; and if we judge of the former *à priori* and of the last *à posteriori*, the same principle applies in both cases; for to what purpose are they bestowed, if not for our especial use, benefit, and delectation?

Disposing thus satisfactorily of the theory in favour of novels, we come to the question of their practice: and this in its consequences, we do not hesitate to affirm, indisputably establishes that Lying is the great law of nature and the bond of all civilized society: that therefore it is the first of the social virtues. A little consideration will develop this important truism.

It is unquestionable that, in the case of the soul, the universality of belief in its existence is an unanswerable argument; and this is found with the vulgar and the enlightened of all countries and ages, from the New Hollander, the most degraded, to the Frenchman, the most sublime, of mankind; from the Tatar savage to the German sage, his genuine lineal descendant. Is falsehood less universal?

Let us just glance at its philosophy as the best evidence of theories.

The idealisms of Plato, and the Greek philosophy, prove that those mighty ancients were far from satisfied with the forms of actuality and its real influences. The Brahmin, whose wisdom all the world admits, since he reserves to himself all the

good things in it, affirms in his invaluable Vedanta philosophy, that nature is *MAYA*; according to Vans Kennedy, a delusion; according to Colebrook and Haughton, an illusion; that is to say, either an impression, which does not exist, of realities, which do exist; or else an impression which does exist, of realities that do not exist. This system is well worth preserving for its conclusiveness. The Buddhist insists that all existence is absorption; and his staunchest advocates are the friends of the bottle. Antiquity affirmed all and doubted all, till at length Berkeley in England demonstrated that the world without was the world within, and that this was nothing; in contradistinction to the ancient theory, that external nature was everything, and no part of it anything. The German philosophers, fortunately, have set the question fairly at rest. Kant proves that though nature exists, we know that we do not know it: however that may be:—and this was a great improvement upon the idealism that had previously affirmed, that we know nature does not exist because we have impressions that it does. These theories have one great advantage, *viz.* that they all differ; which clearly is the proof of their mutual corroboration: and Matter, in spite of Leucippus, does not exist, because it occupies space; and Space does not exist, because it is extension; and Extension does not exist, because it is an idea in motion; now an idea cannot have motion, for the former is immaterial, this material; but an idea may have an idea of motion, which therefore stands still, and is not motion; and this is refining as far as we can go, and therefore when we think we exist, we do not exist, and we do not think; whatever we think to the contrary.

The great principle of falsehood, thus established in Nature, is illustrated by the practice of social life; we see it in every act of our own, our friends, our kindred, country, and the human race. The child steals a cake, tells a falsehood to hide it, gets another cake for good conduct, and the parents are happy. A friend belies you in your absence, reports it as praise to your face, and you love him for his worth, which you depreciate when his back is turned. Your own dissipation abroad you represent at home as martyrdom, and your wife, who never goes out, always believes you to the letter; for women rarely distrust you and never deceive. The statesman and the general soften unpleasant facts and exaggerate successes; each man deceives himself and every body else; thus all are satisfied with delusion, and the bond of society is falsehood. Display but the truth, and all

go by the ears : the cat begins to kill the rat ; the rat begins to gnaw the rope ; and so on ad infinitum, till social order is dislocated at once. In practice as in theory then we trust we have proved that lying is the great principle of Nature, and the bond of social life. If Truth be valuable, how much more valuable is lying : for LYING IS THE ECONOMY OF TRUTH ; and therefore the FIRST OF THE SOCIAL VIRTUES.

Once conscious of this great bond of union we directly perceive the value of novels to mankind, and discover the striking fact that the nations who earliest possessed these became the most civilized in consequence. The mind, intent on truth, starts off from it with an hypothesis, or fiction, and thus fiction is the key of fact, the calculus of all its problems, the assumed term in mental Progression, itself the arithmetical " rule of false," or wilful assumption of a known error to aid the most matter-of-fact-sciences.

We have seen, first, that Philosophy or the love of Truth leads man to deny the undeniable truth ; and now find Fiction, or the love of Falsehood, operating to banish Falsehood altogether.

Thus, then, we apply novel-reading to life ; and by imagining what never happened prepare ourselves for what may really happen ; and, since this prevision is the business of life, the business of life is, first to read novels ; and secondly, to act them on the real stage.—Q. E. D.

We have devoted an ample space to so new and important a proposition. We now return, like true philosophers, to the spot whence we started, namely, to M. Paul de Kock.

The excessive facility wherewith this gifted writer produces these light and pleasing efforts of imagination, appears, somewhat as in the case of Sir Walter Scott, Cooper, and others, to have misled the world as to the means by which such sustained labours are effected. It is not merely, nor even principally, from external observation, we suspect, that these pictures of truth and reality are drawn ; let us examine as we may those who surround, or those who are thrown near us in the perpetual changes of life, and we shall ever find them, however possessed of what is generally termed character, deficient in the multitude and variety of characteristics that are indispensable to fill effectively a prominent part upon the novelist stage. The changes of chance and circumstance that affect such persons are by no means always, or often, of a strength to develope in any great extent the peculiarities of temperament. Let truth be ever so much more romantic than

fiction, still its incidents, generally speaking, are so wide apart from each other ;—so thinly scattered over the whole scene of life ; and with so much to interpose, modify, and correct the impressions and passions roused by one event before another presents itself, that the character of yesterday, which might be justly anticipated as to its action to-day, and calculated on with some certainty for to-morrow even, grows often in the course of months and years entirely out of knowledge, since we cannot follow in all his steps ; consequently when we predicate of his conduct in certain circumstances of real life exactly as we would of a similar character in a novel, we are almost invariably deceived ; and however true to nature the tale may be in itself, it continually disappoints us when we run the parallel into reality. The novelist then does not seek altogether in life the originals of his sketches ; he does not confine himself to the mere practical before him ; if he does, his characters are cold and flat, his incidents wire-drawn and few, and his readers fewer. It is perfectly like life we confess, and therefore feel it has much of its insipidity ; for the common haunts of men are level grounds.

Another class of writers run into the opposite extreme, and make their story one tempest of violent excitements from all the points and all the winds of the compass at once or in close succession ; just as in the Italian proverb, " one devil drives out another." But in any thing above the very lowest class of readers, such efforts produce speedily a degree of lassitude the more difficult to shake off, inasmuch as the same mind that induced has to dispel it, and by similar means, thus becoming its own rival. Now as the powers of every mind, however gifted, have their limit ; and as those which particularly affect the more violent emotions and deeper springs of the soul, are, from the very nature of their studies and pursuits, concentrated and condensed in that severer sphere, they can the less easily hope to vary their range, and give the jaded reader a totally novel impulse ; such as would be done at once by any other mind than their own, for each has its proper bias. The result is that they go on, generally, in the same course, adding stimulant to stimulant to force excitement out of languor, till they insensibly lose all relish for the simple, and nature with them is one tornado, drowning all the milder breathings of humanity : the sky is darkened with clouds, the earth deluged with torrents ; and the gentler feelings of mankind, when brought out reluctant from their hiding-places, are exhibited in furious rapture or agonies of repose, or else, like

the peasants of the Landes, tread the long intervals of humanity upon stilts if they would seek to preserve a proportionate existence. Rage and horrors of every kind, possible and impossible, thus succeed each other till the charms of fiction become a Newgate Calendar, and the hero, and the author, deservedly finish their biography at the gallows.

Writers of this class are generally in themselves men of great amiability as well as ardent imaginations, that seek provocatives to give themselves strength, and sustain these formidable flights. Unaccustomed practically to the worst passions, they never dream of their real intensity, never consider how easily these are excited and with what difficulty appeased, till formidable or fatal consequences have ensued. If Schiller's "Robbers" did not produce any amateurs of crime in England; if the Esmeraldas and Turpins have not brought forth tangible fruit, they still and, the first instance especially, exhibit the tendency to demoralize the community; more or less it may be, but still, to demoralize; for does not the excitement of every passion confirm it into a habit? Coleridge, who once defended his writing a virulent philippic against Pitt, upon the principle that the indulgence of imagination deadened actual feeling, forgot that this excuse could apply only to the writer, but that the denunciations strengthened the worst feelings of his readers: he was pained too to find the artificial virulence of his poem produce also a real virulence in some breasts against the writer:—he thought such emotion unjust, for he was then too young to weigh the necessary counteraction of one excess by another; but it showed that nature will vindicate her insulted rights, and her pulse is the voice of Reason, echoed by every heart despite the shallow subtleties of such a defence.

We would quit this painful subject by asking such writers, and one of the ablest of them, our own countryman, is also one of the mildest and most amiable of living men, whether the tendency to such excessive displays of force does not show a want of due confidence in, if not an absolute defect of, genius? The highest powers of mind can surely seize and wield, better than the wild pitch-fork that tosses about these burning straws of mental incendiarism, those finer shades of character and emotion that are elicited by circumstances more congenial to our feelings and fancies, and of more value even as experiences. Is it less triumph to exhibit these, the finer traits that escape the vulgar artist, and bring them to light, and before the public eye, that never

fails to recognize the master by his touch, the masterpiece by its truth? Is not, even, the triumph more noble and more universal that speaks to all bosoms, than that which addresses itself only to the coarser class of readers? Even the genius and kindly spirit of Dickens himself could not save the beautiful creation of *Oliver Twist* from the loathing that followed the ill-judged protraction of scenes of vice and depravity; when that exquisite picture, the most simple, the most beautiful which the English language can boast, of the helpless, hopeless, broken and dying infant, clinging amidst all his desolation to the one equally wretched and hopeless friend and partner of his early afflictions, was succeeded by a long and elaborate development of courses that ought to have been unknown, at least to all but the miserable actors in such scenes, what pure mind did not shrink,—what parent did not loathe and dread the fatal exhibition for his children's sake and his own. But genius, ever docile, saw its error and retracted at once: Mr. Dickens felt just confidence in his own powers; and in calmer scenes and less revolting situations he has subsequently won a higher meed; one as far above all vulgar competition as it is free from a stain, or a reproach. This, certainly, is not the place to discuss the merits of such a writer, who deserves an article to himself, and from the ablest hands: our inquiry therefore returns to the previous subject.

Were we, however, to proceed with the school of Victor Hugo and his great rival Ainsworth much further, according to their merits, we should infallibly be conducted towards Tyburn, or La Grève: but objecting upon principle to the process of decapitation at the latter; and feeling reluctant to appear as a pendant at the former, even by way of a note of admiration to one of Mr. Bentley's puffs,—notwithstanding the elevated authority of the respectable "Jack Sheppard," who came on that stage, perchance not wholly uninvited,

"All hanged for to be,"

as the poetic chronicle of that great and good man with classic pathos assures us was his particular object at the time;—we turn to a different class of novels, introduced by a writer at first evidently tinctured with a strong propensity for the Court of Assizes.

The really great powers of the head of this school, the Apostle of sensualized philosophism, were from the first apparent, and not less so the injury they had suffered in their infancy by being overlaid by the incubus of French and German extravaganza.

But it was then hoped that his genius, struggling under this disadvantage, would be able to force itself into light and proportion through the chaos by which it was obviously enveloped. We know not, however, by what unfortunate process its footsteps were led into that limbo of vanity, from which, despite its better nature, it has never emerged, but on the contrary seems disposed to rest there as its appropriate place and home. If, running from the one extreme, that of the purely horrible, the author had by good fortune been unsuccessful in his first attempt at its opposite excess; or had the popularity of this been less extensive than it deserved, less than universal too among the more amiable sex; confident of his own powers, the writer in question would have risen renovated by the repulse—and steeled his intellect to grapple with the practical and effective. Unhappily for his true fame the result was far otherwise, and stimulated him to advance in a field, not worth, assuredly, a second triumph. Still he had, and must have, readers; and these, too, numerous, not owing to his own intrinsic merits alone, but to the peculiarity of his theme also. The class of intellectual triflers, the gay, the idle, the superficial;—the fair sex too, that portion at least which, anxious for mental superiority, holds philosophy ever bound in morocco, and loves it in gilded letters;—all these were his votaries and readers. The libraries were crowded, their shelves were emptied of his works; these were invaluable to indolent aspiration; the very elixir of life to those dying of literary inanition. Profundity was rife on satin paper; reason embossed the edges of her scrolls; the duties of life were small and fragrant in perfume, and energetic virtue lisped magnanimity from the sofa. Analysis devoted its patient labours to a down-bed, and was fed with half-masticated metaphysics from the pap-spoon. Who could be ungrateful for this? The gods, victory, and Cato were all on one side, with satin stocks, rosewood tables, and ottomans. For these “the soft trium-vir” of manners, morals, and metaphysics, abandoned sterner contest, lost the empire of the world, and was contented to lose it.

And what has become of that once glorious promise? The question is one of sorrow no less than anger. The strength that might have peopled the world with a fresh creation of genius now beardless and emasculate for the slothful slaves of the harem. The honey of Hacho was not more enervating; and let the silken idler blush for such perversion of talents and learning. For all that might and ought to have done honour

to his country we are presented with a Plato in pink, and an ethical system of sugar-plums. The writer has “thought away” his energy as well as his “enthusiasm.” Nature in his hands is a first-rate varnish; woman, a starched flounce, with a purity of isinglass, smooth, but flexible:—simplicity pirouettes, history rants: a heroism of silver paper, a poetry of carmine, a philosophy of eau-de-Cologne: even his good breeding savours of brandy-punch, mixed with tea; and the very graces with him are redolent of the best Schiedam. All is elaboration, exaggeration, bad habits, continual efforts to be fine, with constant failure: no calm consciousness of strength; no dignity; no repose; his despair would like to die, could it but know what was thought of it; and his passion would throw itself from the Monument, only that his cab cannot be seen in the city. The very morals of this modern Chesterfield resemble his predecessor’s, at least as described by the satire of Johnson.

The author in question is perhaps the only man who need not yet despair; if he will but strive to reach the eminence he might by this have gained, he can scarcely fail, we think, of success; but he must be satisfied to renounce fictitious triumph, and trample upon the silken bonds of his present indolence. He must undo much that he has done if he would attain the first rank in serious literature; he must dissipate his fastidious dreams, sweep away the cobwebs of phantasy, and strive to think soundly instead of finely; when he has done this he will have half attained his end, for, he will not need to print his apophthegms in CAPITALS AS AT PRESENT.

We have dwelt the longer upon the Coryphæus of this school, because it seemed extending to the Continent; but in France it appears to have already sunk, despite the native taste for the ridiculous, and in Germany its disciples will be as little understood as their great prototype is in England or France. He has vanished into smoke before Dickens and De Kock.

Of this latter, our more immediate theme, we have little to add to the remarks offered in a former notice of his works; and that little we proceed to state here. We have already intimated in the previous pages of this article that it is not alone to the external manifestations of life and character that the novelist, the only moralist of the present day, should turn for subjects. He must, in truth, look rather to the development of the world within, and watch his own motives, tendencies, and passions, long, close, and continually, before he can attempt to

scrutinize the feelings of others as developed in their conduct. It is not, as generally supposed, by intuition of other minds, nor even a searching observation of others' conduct down to the very minutiae of their existence, that he can obtain this faculty; his spirit might be a glass reflecting each form perfectly and to the life, yet it would, like that, lose every trace as soon as the original had vanished, it, like that also, it possessed nothing beyond a surface. It is only in the power of sympathy, residing, indeed, more or less in every breast, but cultivated alone by the man of genius, to go far beyond the outward forms and shapes of passing objects. It is by frequent solitude, by constant self-observation, and by ceaseless comparison of the acts of other men with the feelings of his own bosom, that he can hope to attain that facility of searching the human heart and laying bare its workings which has formed the renown in our day of Scott, Dickens, and De Kock; for Cooper, whose genius for the description of nature at least equals the first of these, has nothing of the power even of the last to scan the workings of the secret spirit—and Sue, and Heine, &c. exaggerate them even to mockery.

It is in truth the remarkable characteristic of Paul De Kock that with all his relish for individuality, with all his care to mark the idiosyncracies of his personages, and his unsurpassable felicity in observing and adhering to them throughout the whole conduct of his very numerous tales, often as he wakes by a touch the very sources of the loftiest emotions, he seems never able, or willing, to dwell upon them. Whether this great writer fears that concentration of his powers would operate materially to diminish their variety;—whether he has been, by temperament and love of society, little disposed to meditate severely and long upon his own sensations;—or whether, as Barante observed of Voltaire, what he sees is at a glance, and the faculty of deep careful thought seems denied him,—we cannot assume to decide: but it is certain that whenever roused to a scene of deep and solemn tone, such as could scarcely fail to be effective in any hands, and least of all in those of the contriver, he is content to strike it off with a single stroke of his pencil, disappointing the reader, and depreciating his own powers. His works consequently are not finished pictures but moving panoramas; but as such pregnant with nature and truth.

We take, as an illustration, his *Barbier de Paris*, which, as a romance, would seem not only to afford, but absolutely to call for,

those bolder markings and darker and deeper traits of colour and feeling with which we are wont, and with evident justice, to invest the ages of feudal rule and tyranny; ages of Gothic gloom, barbaric splendour, and furious passions, over which the imperfect light of history, less domestic than political, has thrown a shade congenial to the deeds it witnessed and described; and which afford to Scott, and to writers far his inferior, hues whose bold effectiveness atones for many errors of design and execution; and we select this work in preference, not only as it is the author's chief specimen of the Romantic, but also as having been omitted by oversight in our former article on this subject. (For. Quart. Rev. No. 10.)

The following is true, though slightly touched—

“Who could withstand the smile of Blanche! Age is all the more sensible to such allurements, from so seldom experiencing them; and this is, perhaps, the reason why an old man sometimes loses his senses when a pretty girl gives him a tender glance, seeing that he has been so long unaccustomed to so flattering a token.”

An excellent picture follows of Chaudoreille the marplot, a gasconader, boaster, fool, and coward, and entertaining of himself an opinion commensurate with the lawful possessor of these eminent qualifications for success in war and love; to which last, though not to the former, he was attached with a devotion worthy of a better fate.

“The person who now entered Maitre Touquet's house was a man of four-and-thirty, but who seemed at least five-and-forty—so wizen was his face, and so hollow his cheeks: his sallow complexion was only relieved by two small scarlet circles upon his cheek-bones, the brilliancy of which betrayed their origin. His eyes were small but rather lively, and Monsieur Chaudoreille kept them constantly rolling about, never fixing them on the person he addressed: his short pug-nose formed a striking contrast with the immensity of his mouth, which was surmounted by an outrageous moustache, red like his hair, while beneath his under lip flourished an imperial, terminating in a point on his chin.

“The Chevalier's stature was barely five feet, and the meagreness of his body was the more apparent from the threadbare close coat which enclosed it. The buttons of his doublet had disappeared in several places, and a variety of botched darns and mendings seemed on the point of breaking out into holes again. On the other hand, his breeches, far too wide, gave an immense size to the upper part of the leg, which made the shrunk shanks, which issued from them a little above the knee, appear still more slender

than they really were, for the funnel boots which he wore, falling as they did on the ankle, did not hide the absence of a calf. These boots, of a deep yellow colour, had heels two inches high, and were always provided with spurs; the doublet and breeches were of faded pink, and were accompanied by a little cloak of the same hue, which barely descended to his waist: add to these a very high ruff, a little hat surmounted by an old red feather, and cocked on one side; an old green silk belt; a sword much longer than was usually worn, whose hilt in fact rose to his chest, and you will have a faithful portrait of the individual who styled himself the *Chevalier de Chaudoreille*, whose slight Gascon accent denoted his origin. He walked with his head in the air, his nose stuck up, his hand on his hip, his leg stretched out, as if about to put himself on his guard, and apparently disposed to defy all who passed by him.

"On entering the shop, Chaudoreille threw himself on a bench, as if overwhelmed with fatigue, and placed his hat beside him, exclaiming,

"Let me rest myself a moment. *Sandis!* I well deserve it!—Ouf!—what a night! Gad, what a night!"

"And what the devil hast been doing to-night, to tire thee so much?"

"Ah! nothing very extraordinary for me, 'tis true; beaten three or four great fellows, who wanted to stop a countess's sedan; wounded two pages who were insulting a girl; gave a few inches of my sword to a student who was about to enter the window of a house; delivered over to the watch four thieves who were about to rifle a poor gentleman;—that is about what I did last night."

"Peste!" said Touquet, as a sneering smile escaped him, 'dost thou know, Chaudoreille, thou alone art worth at least three patrols of the watch? It seems to me that the king, or monsieur the cardinal, ought to compensate such fine conduct, by naming thee to some high post in the police of this town, instead of leaving such a brave and useful personage to run about all day from one gambling house to another, trying to borrow a crown.'

"Yes," said Chaudoreille, affecting not to have heard the latter portion of what the barber had said, 'I admit that I am very brave, and that my sword has often been of service to the state; that is to say—to the oppressed; but I have ever acted disinterestedly; I yield to the impulses of my heart: 'tis in the blood. *Cadidus!* Honour above all things!—and in these times we are not given to trifling!—I am what they call at court 'the very punctilio of honour.' A disrespectful glance—a cold look—a cloak brushing against mine—*presto!*—the sword's in my hand; that's my only argument; I would fight with a child of five years old if he were disrespectful!"

"I know we live in times when people measure swords about nothing; but I never heard that thy duels had made much noise."

"I dare say not, my dear Touquet! dead men don't speak, and those who have to do with me never get out of the scrape. Thou hast heard of the renowned Balagni, surnamed the brave, who was killed in a duel fifteen years ago. Well, my friend, I am his pupil and successor."

"It is unfortunate for thee that thou wast not brought into the world two centuries earlier. Tournaments are getting out of fashion, and the knights who redressed wrongs, and split giants in two, are no longer seen—except in picture galleries."

"It is certain that, if I had lived in the time of the Crusades, I should have brought back from Palestine two thousand Saracen ears; but, my dear Rolanda was there. This redoubted sword, which I inherit from an ancestor who had it direct from Orlando Furioso—hath sent a devilish lot of people to the other world."

"I'm always afraid of its throwing thee down, it seems too long for thee."

"And yet it's worn an inch shorter since I had it; if I go on in this way, it will become a mere stiletto."

We have a sketch of domestic felicity in a few words—

"I may say, with pride, few families are so united as our own; during the four years of my being married to my second husband, Monsieur Legras, we have fought but five times, and then always for mere trifles."

The gallant cavalier is out with the unwonted sum of ten crowns in his purse, on an errand of discovery and love.

Chaudoreille again looked round him, placed his fingers on his lips, examined all the persons in the shop, pushed away the footstool on which the cat was lying, then bending towards Julia with the air of a conspirator, whispered in her ear:

"A great lord sent me to you—a man tremendously rich—a personage in favour—a gallant, who—"

"It is!—it is the Marquis de Villebelle," said Julia, out of patience; 'I know it! What would he with me? what did he bid you say to me? Come, sir, come!'

"I must be peculiarly skilful," thought Chaudoreille; 'people guess at once, even without my saying so, what I have to say to them. Since you know his name,' resumed he, again approximating his face to the ear of Julia, who roughly pushed him away, 'I need not tell you that this nobleman adores you.'

"He did not charge you with the expression of his sentiments?"

"No; but he charged me to ask for an interview; if you deny him this favour, he will set the four corners of the street on fire, that he may have the pleasure of saving you. For mercy's sake, fair Julia,—for so I think they call you, which makes me presume you are not French—am I right?"

"Were you charged to ask me that?" said Julia, looking disdainfully at Chaudoreille. The latter bit his lip, put his left hand on his hip, and whispered—

"What shall I say to the noble Marquis de Villebelle, whose confidant I am, and whom I now represent?"

"That he should select his envoys better," said Julia, drily.

"I was sure of it," said Chaudoreille to himself, stepping back a pace or two; "she has fallen in love with me; my person is playing off its old tricks. It's very disagreeable; I ought to have disguised myself a little, or at least to have kept my eyes from inflicting new wounds. There is money to be made here,—I must not forget that." And Chaudoreille repeated to Julia,—to whom he now, very prudently, only presented his face in profile—"What shall I tell the marquis? Where will you be walking to-morrow evening?"

"Julia was silent for some moments, and appeared in deep reflection; meantime Chaudoreille felt his purse, in great anxiety as to her answer.

"At all events," thought he, "I won't return the ten crowns."

"To-morrow evening, at eight o'clock, upon the Pont de la Tournelle," at length replied the young Italian, for Julia was indeed not a French woman.

"Enough," said Chaudoreille, still only showing his profile, "I ask no more, and I shall now hasten away, lest the continuing to see me should induce you to change your resolution."

"He had already reached the door, and was about to make his exit, when Julia called him back.

"You have forgot to pay for the riband, sir."

"Gad, that's true!—Devil take me!—It's always my way; I'm so giddy, so absent."

"So saying, Chaudoreille took out his purse, and counted backwards and forwards the ten crowns it contained into his hand.

"I'm afraid I've no change with me," said he; "in general I carry only gold; 'tis lighter. How much do you want, fair one?"

"Thirty sous, sir."

"Thirty sous!—for a rosette?" cried Chaudoreille, with a very long face, and returning the crowns into his purse; "that's horribly dear: you must perceive that the riband is very narrow."

"For a man who carries only gold," said Julia, smiling, "I'm really surprised you should want to make a bargain about such a trifle."

"I don't want to bargain, but still I think that some reduction might be made; four-and-twenty sous ought to be enough for a superb rosette. No matter, I yield: give me the change."

"With a deep sigh he then handed over one of the crowns, and while the Italian was counting out the difference, he attached the riband to the handle of Rolanda: the effect of the riband somewhat alleviated his regret

for the thirty sous. He took up his change, and recollecting that there was another claim which might be made upon him, he hastened to the door, skipped out into the street, and departed with the speed of lightning.

"And the glass!" said the old woman; "has he paid for that?"

"Ah, Lord, no, madame," said Julia.

"I was sure he wouldn't; run, girls, run;—a rascally puppy, that wants to come the dandy, with his old thread-bare cloak and his feather, that I would not dust my shelves with. He puts everything topsy-turvy, nearly pokes out my cat's eyes, says impertinent things to me, is bargaining two hours for a rosette, and then runs away without paying for the glass he broke. It's some pick-pocket, some cut-purse!"

"The two girls opened the door, and looked up and down the street, but Monsieur le Chevalier was nowhere to be seen.

"It's my fault, madame," said Julia, "I ought to have asked him for it; but I will pay for it."

"Yes, mademoiselle; that will teach you another time not to listen to these gentlemen, who give a great deal of trouble without having a penny in their pockets."

"The young Italian made no reply. It is probable that at this moment neither the pane of glass nor the chevalier occupied her thoughts."

Blanche, the daughter of Touquet, the Barber of Paris, has a lover, Urban, who attempts to see her in disguise. The scene is spirited and characteristic, and we extract it altogether.

"The bachelor, in his petticoat and cap, felt very little at ease in the streets of Paris. Although it was night, and there were but few lanterns, no sooner did any one approach him than Urban fancied himself recognized, and expected to be taken up by the police, who might inquire the cause of his disguise, and require something handsome by way of ransom, if he continued to walk about dressed up as a woman; for at Paris, as elsewhere, it is only by scattering money about that you can pass for what you are not; and as Urban had not a single crown about him—for one cannot think of every thing on such occasions—the young lover felt the necessity of getting out of the way of the officers of justice. As for thieves he had no fear of them, which was saying much in those times. It is saying something indeed even now.

"By degrees Urban acquired more confidence; he began to get accustomed to his costume; and various tender phrases which had already been addressed to him as he passed along convinced him that his sex was not at all suspected. Urban made no answers to the unceremonious compliments addressed to him; he hastened on with increased speed, covering his petticoats with dirt in his progress, for he did not know how to hold them up, and they were sadly in his way when he

wanted to jump over the kennels. At length he reached the Rue des Bourdonnais; and it then for the first time occurred to him that it was rather late to attempt to introduce himself into the barber's house. There was not the slightest probability of Margaret's coming out now; his disguise would be of no use till next day; it was absurd and useless to have assumed it so soon; but lovers do not make these reflections. Besides, as Urban wished to get used to his feminine costume, he did not regret that he had put it on. While making these reflections he walked up and down in front of the barber's house, looking up at Blanche's windows, sending her a thousand sighs, which she did not hear, for she was asleep; and which very likely she would as little have heard even had she been awake.

"Absorbed in the delight of sighing underneath the windows of his fair one, Urban did not consider that, though it may be natural to see a young man waiting and sighing at night in the streets, a woman alone at so late an hour gives rise to many conjectures. All at once the young lover was roused from his ecstasy by some one pinching his knee, and saying to him in a terribly hoarse voice—

"It seems, my little love, that he thou expectest is behindhand; if thou wilt take my arm, we will go and taste the white wine of the merchant down yonder; I am a customer of his, and there are—"

"Urban turned round, and saw a great fellow in a chairman's dress. Not at all amused with this adventure, the young bachelor set off running, leaving the gallant behind; but two hundred yards further on he was again stopped by two pages, who insisted on a kiss; he got away from them, and resumed his flight. Next he was accosted by some students, then by some lacqueys, then by some soldiers; some of his admirers pursued him, and Urban to escape from them redoubled his speed, and to facilitate his flight gathered up his clothes to his knees, a proceeding which appeared to increase the ardour of his pursuers.

"*Morbleu!*" said Urban to himself, as he dashed on, 'I did not dress myself as a woman to be pinched by every page and lacquey in the town—the devil's in them! Curse these petticoats. But never mind! Tomorrow I will introduce myself to Blanche. Courage! perhaps these fellows will give up.'

"Urban leaped over the kennels, wound along the streets, perspiring, half suffocated under his stays and the padding with which the servant had furnished his chest: taking any turning that presented itself to him to elude his admirers, he knew not where he was.

"At length, hearing no person behind him, Urban paused to take breath; he then recognized where he was. He had passed the bridges, and had reached the great Pré-aux-Clercs, in which they had begun to build houses and open streets, as they had done in the little Pré-aux-Clercs, which towards the end of the reign of Henry IV. was quite covered with houses and gardens.

"'Good!' said Urban, 'this is the new street, the Rue de Verneuil; there's the *Chemin-aux-vaches*, where they are building the *Rue Saint Dominique*; I know where I am; but let me rest a moment—I am too far from home to start again directly—I am overcome—I must take breath. This is a lonely place, though—the night is advanced, I only hope I shall make no more conquests.'

"Urban gathered up his petticoats and sat down on a stone. At the end of half an hour, feeling no longer his fatigue, he rose and proceeded homewards: he was walking slowly, congratulating himself upon meeting no person, when on a sudden coming to the Rue de Bourbon he met four men, who, on seeing him, stopped short and barred his way.

"'Oh! oh! what's this?—so late too!—the game is still afoot!'

"'On my honour a most delightful rencontre!—it is a little farmer's wife!'

"'So much the better—I like these country girls vastly—'

"'The devil, Marquis! What! a country girl promenading Paris in the middle of the night! The little innocent must be immensely courageous!'

"'Come, come, chevalier, thou hast always got some wicked thought in thy head. I will lay a wager that the poor child is only come to town to sell her eggs.'

"'Let her be come for what she may she shall not return till my mustachios have been pressed against her pretty mouth.'

"Urban saw from the language and manners of these gentlemen that he had to do with highflyers. As he could not run away from them, for they encircled him completely, he endeavoured to get rid of them by saying in a feigned voice—

"'Gentlemen, for heaven's sake, let me go; I am not what you take me for.'

"But his prayers were unheeded; they pressed round him and caught hold of him; Urban, impatient of their proceedings, saw no other means of getting away than by making himself known, and he accordingly exclaimed in his natural voice—

"'Leave me, gentlemen; I repeat you are mistaken in me.'

"These words, pronounced by the bachelor in a way that left no doubt of his sex, produced upon the four young lords the effect of Medusa's head; they were struck motionless; but soon they all burst into a roar of laughter.

"'It is a man! A most unique adventure!'

"'Yes, gentlemen, it is a man,' replied Urban; 'I hope you will now allow me to pursue my way.'

"'For my part I have no objection,' said one of the party.

"'Come, come, Villebelle,' cried another, 'let the lad go—thou seest it is not a girl!—'faith, I believe he has drank so much wine that he does not yet perceive his mistake. Eh, Chevalier.'

"Villebelle, however, whose head was heated by wine, persisted in detaining Urban.

"'An instant, my lad,' said he. 'We know thou art not a girl; so far so good; but by all

the devils, dressed up in this way, thou must have had some pleasant adventures ; relate them, they will divert us, and then thou shalt be at liberty.'

" 'Yes, yes,' repeated the others, 'he must tell us why he's dressed up as a woman.'

" 'I shall regale the private levee of the cardinal to-morrow with this adventure.'

" 'And I shall tell it Marion de Lorme.'

" 'I shall get Bois-Robert to put it into verse for the court.'

" 'Colletet shall make a comedy of it ; come, tell us.'

" 'Once more, gentlemen, allow me to go,' said the bachelor impatiently. 'What right have you to question me ? I have nothing to tell you, and will go !'

" 'So saying, he again pushed back the Marquis, but the latter stopt his way, and drew his sword, exclaiming—

" 'On my honour the little fellow is quite in a passion ! This is too ridiculous ! Thou shalt speak, or we will make thee leap our swords like a water spaniel.'

" 'Insolent !' cried Urban furiously ; 'if I had a weapon you would not dare to use this language, or, at least, I should make you repent it !'

" 'Indeed !—Parbleu ! I'll see how thou canst use a sword ! Chevalier, lend him thine.'

" 'What, Villebelle ! wouldst thou—'

" 'Certainly, a duel with a country girl !—it will be amusing ; come, gentlemen, a ring !'

" 'With these words the Marquis took the sword of one of his companions and presented it to Urban.

" 'Here,' said he, 'is wherewith to defend thyself. Now, on your guard, boy-girl ! and let us see if thou art brave as thou art obstinate.'

" 'Urban eagerly seized the sword, and at once attacked the Marquis ; though embarrassed with his petticoats and his stays, he rushed with impetuosity on his adversary, who, parrying his thrusts, cried every instant—

" 'Good !—very good, upon my honour !—Look, gentlemen—there's a parry !—a capital thrust !—Peste ! I need all my address to—'

" 'The passing of Urban's sword through the Marquis's fore-arm cut short the sentence ; his sword fell from his hand ; his friends surrounded and held him up ; Urban himself approached to assist him.

" 'It is nothing, it is nothing,' said the Marquis.—'Adieu, my friend, thou art a brave fellow, I am glad to have made thine acquaintance, though I know not with whom I have been engaged.'

There is sound truth in the concluding remarks of the following :—Urban, still dressed as a girl, succeeds in persuading Blanche's attendant that he has a magic story to tell ; and as the latter and her fair charge are closely immured by the Barber, the curiosity of the old dame, and her love of the marvelous and of secrets, overcome her scruples.

" 'Margaret hastened to Blanche ; since the evening of the serenade, the poor girl had indeed been more pensive than before ; she never sang any thing but the burden of her favourite romance ; and the *villanellés*, the *vi-relais*, the old *tençons*, no longer amused her. Margaret went up to her, and whispered in a mysterious tone,

" 'We shall have a visitor to-night !'

" 'A visitor !' said Blanche ; 'Ah ! Monsieur Chaudoreille, no doubt.'

" 'No ; a young country girl, very pretty ; you don't know her. A poor girl who has a treasure,—and wants a cook's place,—who wishes to remain virtuous,—and has come to Paris,—who fears the devil,—and fears nothing—'

" 'I don't understand you.'

" 'Hush ! hush ! be silent ! She will come this evening and relate her history to us ;—it is about a very curious mystery ; but silence ! not a word ! Monsieur Touquet must not have a notion of such a thing, for he would forbid poor Ursula to come and chat with us, and that would vex me very much,—on your account, my child, for it will amuse you.'

" 'Oh ! be easy ; I shall say nothing about it,' cried Blanche, jumping for joy about the room ; for the promised visit was to her an extraordinary event, and the slightest novelty is delightful to those who pass their lives in a monotonous way. Thus, a storm, however furious, serves to amuse and occupy the poor prisoner ; a bottle of wine is a regale to one who is accustomed to get nothing but water to drink ; the sounds of a Barbary organ appear delicious to peasants : a ticket for the play will crown the wishes of the poor work-girl at ten sous a-day ; a muslin gown will make the *grisette* happy ; and Sunday is impatiently looked forward to by those who toil all the week ; while to many people, plays, banquets, music, dress, have no longer any power of rejoicing their hearts. According to this, it would seem, that the poor are happier than the rich."

It is but just, before passing on, to give the reader a lively sketch from a work recently published, of the popularity and estimation of Paul de Kock.

" We now come to an author who has enjoyed, and still enjoys, more celebrity than any living writer ; that is to say, if the extent of a man's reputation be judged by the number of his readers. From the highest lady in her luxurious *boudoir*, to the poorest *grisette* in her miserable attic,—from the lordly paladin in his spacious library, to the obsequious porter in his narrow lodge,—from the statesman who mounts the tribune in the Chamber of Deputies, to the copying clerk in the attorney's office,—from the Colonel of the regiment, to the private sentinel in the ranks,—all have perused the novels of this distinguished writer—all classes have pored over those pages which teem with gaiety

and mirth, relieved by the finest touches of pathos and feeling—all have felt the magic charm of this great enchanter! A new novel by Paul de Kock creates a more powerful sensation than the speech of the King himself; and on the day of publication, not a diligence, not a mail, not a public conveyance leaves the French metropolis without bearing to the country librarians of all parts a package of the anxiously-awaited volumes. There is not a circulating library throughout France that does not possess one or more complete sets of his works: there is not a news-room where, amongst the few dozens of standard books which grace the little shelf in the corner, the novels of Paul de Kock are not to be found. His popularity extends to the meanest and most distant cottage in the empire: there exists not a labourer who tills the land in the remotest province, that has not heard of Paul de Kock, and laughed at some village pedant's recital of the best episode in his last work.

"Mount the *imperial* of the diligence, and the *Conducteur* will talk to you of Paul de Kock. Converse with the *fille du comptoir* in a Café, and she will ask you to lend her his lately published novel. Hire a *cabriolet de place*, and the driver will tell you that he has just perused Paul de Kock's new work. Chatter with your porter's wife, when she brings you your newspaper in the morning, and she will call your attention to the critique of Paul de Kock's book in the *Feuilleton*. Speak to your cook relative to your dinner having been late the day before, and she will throw the blame upon Paul de Kock. Ask your friend why he broke his appointment, and the reply will be the same. In fine, M. Charles Paul de Kock engrosses public attention as much as the prices of the funds, the measures of the ministers, or the war in Spain. He is a *Monsieur Tonson* whose existence is interminable.

"Nor is his popularity alone confined to France: it extends to every corner of Europe where books are read. In religious—in strict—in domestic communities, are his works devoured with as much enthusiasm as they are by the indolent and luxurious Parisians.

"But let it not be supposed that Paul de Kock can write nothing save humorous tales. His sentiment will frequently wring tears from the eyes. No one can peruse passages of *Sœur Anne*, *Frère Jacques*, or *La Laitière de Montfermeil*, without experiencing the most tender emotions; but no lasting impression is made upon the mind by the scenes which M. de Kock thus envelopes in pathos and melancholy, because the almost immediate occurrence of something exces-

sively ludicrous effaces the reminiscence of the sentimental episode.

"The wonderful imagination of Paul de Kock, and his astonishing powers of invention, are not the least portions of his genius."*

We quote the following amusing passage, not less humorous and original, nor less illustrative of rumour, than the "Three Black Crows."

"The fact was, that the neighbourhood, alarmed by the cries of Durand in the street, and hearing him hallooing after '*la garde*!' fancied he was summoning military assistance instead of a nurse; and up to the period when the history takes leave of her, the servant continually declared that Monsieur Durand had expressly called in a regiment of soldiers to see his wife brought to bed."—p. 243.

He who has never travelled in a long-stage with six dowagers and a child or two in a July night, overcoming us like a summer's dream, he is a man loved by the gods, and ought to die young and in blissful innocence. The fair one who has never entered an omnibus after a long hurried walk with the thermometer at 118 degrees, to save the glories of furbelow and flounce, can alone be indifferent to the following:—

"Towards the end of the month of November last year, one of those Dames-blanches which come down from La Villette to traverse a part of Paris, was scarcely more than one-third of its way, when, at a sign to the coachman, it stopped, and a lady of forty appeared on the steps. A general cry rose in the carriage; which was nearly full, at the appearance of the new traveller. The person who presented herself was, it is true, extremely corpulent; she could well have filled three places, and there was but one vacant on the left bench. The travellers on the right side had some difficulty in repressing the inclination to laugh which the sight of this lady produced; those on the left made many grimaces of dissatisfaction at the new comer, whom they were to be compelled to receive on their bench, but no one moved to make room for her.

"'Sit closer on the left,' said the conductor, making the fat lady mount, whose person hermetically closed the door, and who, not knowing where to place herself, held in one hand the leathern loop, and leant the other against the first knee she met with. 'Sit a little closer,' said, in a jocular tone, a man in a blouze and otter-skin cap—who was seated on the unlucky left side. 'That is good of the conductor; we must have a famous place for this little madam. Ah! well, she is one who enjoys good health.'

* Reynolds's Modern Literature of France, 2 vols. London.

"'For my part I cannot move,' said an old woman near the door; 'I am already horribly crowded by the lady who carries on her lap a child that ought to pay for a whole place, and is never still; and puts his feet on my dress—it's most agreeable.'

"These reproaches were addressed to a respectable nurse who held on her knees a little boy of four or five years old, that had never ceased to eat apples and gingerbread since he entered the carriage. The nurse cast a glance on her ancient neighbour and shrugged her shoulders, muttering, 'Take care not to stain the lady's dress—so clean and fresh as it is.'

"Nevertheless the fat lady is still at the entrance, looking round to where she shall seat herself; and the conductor repeats from without, 'To the left, ma'am; go in; I tell you there is room on the left.'

"The traveller resolves to try, she relinquishes the loop, preferring to depend on the knees to the right and left. The conductor then pulls his string that the coach may go on; but the movement causes the lady to lose her equilibrium. She falls on a basket belonging to a country-woman, who utters terrible cries, saying, 'You will break all my eggs, take care there: Ah my God, and my measure of apples! well, is this the way to tumble on people!' Driven off by the peasant, who was a vigorous person, the lady fell between a grocer and a mechanic. The grocer, who was thin and small, disappeared in a moment behind the voluminous form of the lady, but he was heard to cry in a stifled voice, 'Madame, get off, I entreat you; I shall be suffocated; I will not carry you—get off—ouf—or I will run a pin into your arm.'

"'But, Sir, since the conductor insists that there is room'—

"'But, Madame, that is nothing to me. I have paid for my own seat; place yourself on a stool'—

"'Surely—the men are very gallant at Paris; and I should never have thought that a lady would be received in a coach as an annoyance.'

"The mechanic, rather more courteous, pressed himself against a nurse who was at his left, and said to the enormous lady, 'See if you can place yourself here.' 'I am very willing to try; we shall not be cold.' The lady hastens to let herself sink into the place prepared for her; the two neighbours, the grocer and mechanic, are half hidden by her, but she is seated, and seems to defy the world to remove her from the place she had had so much trouble to obtain.

"Notwithstanding—all the left side of the dame-blanche complain and look vexed. The grocer, of whom the conductor has just demanded his fare, replies angrily, 'Search in my pockets: if you can, you will be lucky! I cannot move an arm—if we remain long in this state, this lady, who is almost upon me, must have the civility to use my handkerchief for me; that will be pleasanter still.' "

The following is one of the few instances in which De Kock puts forth his powers. It tells its own tale—*Tourlourou* signifies a recruit.

"'No, no, Pierre, I wish that you should know all,' answered the young girl, endeavouring to restrain her sobs, 'I will keep my promise, Pierre; you loved me in the village—your love was sincere, I see it plainly; I ought to have been proud of your preference, for you were more highly esteemed than any lad in the town. But I was a coquet—I wished to see Paris—I knew not what ideas tormented me. Soon it was much worse, I was told that I was the daughter of a duchess, that I should some day be very rich. Oh, it was then in my reveries that I fancied myself a great lady! Well, Pierre, all this was false. Madame de Stainville was mistaken, the Duchess of Valousky has never had a child. It was a manuscript that she had left at the *Tourne-bride*. This manuscript was put in Gaspard's care, therefore he knew well that I was not a duchess, and he allowed me to think so only to punish me for having slighted your love.'

"'Can it be?' said Pierre—'what, you are not a great lady—you have not a large fortune. Ah, what happiness! But pardon me, Marie, I rejoice in that which gives you pain. Ah! that is very wrong in me—it is because I could not master—but, my God! can it be from grief at not being a duchess that you wished to die? Oh, no, this is not possible; at your age we do not die of grief for the loss of fortune.'

"'No, Pierre, you are right; it is not this which reduced me to despair. Although I have been humiliated, driven away from the lady, who made me quit the house where I had been brought up,—I could have borne all this—but another motive—ah, now indeed you will despise me.'

"'I despise you! never, never; but speak, Marie, go on.'

"'Pierre, twice you have saved me when fallen into snares—when about to become the victim of my confidence: but, alas! you were not always there—and then that time it was not a snare that was laid for me—it was accident—my weakness—Pierre, I can never return to the village, for I bear with me the pledge of my fault; and he who has made me a mother can never be my husband.'

"'Mother,' murmured Pierre, turning pale; the head of the soldier bent towards the earth, and he appeared for some instants overwhelmed by the avowal Marie had made, while the young girl wept and still covered her face with her hands. But soon the features of Pierre became animated, his eyes flashed fire, and he cried—

"'Who is he, the wretch, who has degraded you? his name—speak! speak! Marie, he shall marry you, or I will have his life.'

"'I will not tell his name, because I cannot be his wife; and I will not have you shed his blood. No, I ought not to be avenged,

because in this case there were neither snares nor seductions. I thought I was beloved—because I loved I sought out him who thought not of me. Ask me no more for his name, Pierre, for I repeat I will never tell it you.’

“‘You loved him!’ said Pierre, heaving a sigh; ‘you loved him, and yet you were not beloved! while I’—and two large tears fell from the eyes of the soldier.

“‘You now see, Pierre, that I had cause to wish to die, and that I can never again return to the village.’ The soldier paused some time without answering; his head sunk upon his breast, and he appeared absorbed in profound reflection. Suddenly he raised his head, his brow cleared, and he extended his hand to Marie, saying,

“‘Dear Marie, you have told me that henceforth I should be the arbiter of your fate; do you still consent to it?’

“‘Yes, Pierre, because if I had always followed your counsels, I should now have nothing to reproach myself with.’

“‘Well, Marie, all your misfortunes may yet be repaired; become my wife, I will be a father to your child; and never, I swear to you, never will I again name to you the fault that you have committed.’

“‘Pierre! what do you say! I your wife? and would you still have the poor Marie?’

“‘Listen,’ said Pierre, ‘if I have supported life, was it not in the hope of consecrating it entirely to you? It required courage even in me not to yield to despair when you rejected my love; and now would you render this courage unavailing, and would you again refuse me when I can restore you to honour—to repose—when I can save you from a crime?’ Pierre had thrown himself at the feet of Marie, and he pressed to his heart and lips the hands of the young girl, who, touched by such noble devotion, so true a love, felt that she might yet be happy; and, giving her hand to Pierre, said,

“‘Dispose of me as you will, my existence is yours.’”

But our favourite tale is the touching story of Zizine—the most graceful form of infancy—a child, poor, timid, quiet and fond—the pencil that sketched her was dipped in the brightest light heaven sheds upon earth and its earthly inhabitants. We shall extract largely from this portion.

M. Guerreville is a widower, who has lost his daughter also; and to relieve his melancholy he one day takes to hunting out lodgings;—in a house in a very humble street,

“A little girl of six was mounting to the fourth story just as M. Guerreville put his foot on the first step to descend. The child was poorly and thinly dressed for the season; a cap of brown cloth covered her head; a gown patched in many parts; an old black apron, composed all her dress; and her tiny feet were already inclosed in wooden shoes.

She carried under her arm a round 4 lb. loaf, a burden that must have been heavy for her; yet she appeared proud of carrying it, and looked at it with great triumph. Arrived at the landing, she held down her head on seeing strangers, and directed her steps towards another little dark staircase, much like the ladder of a mill, and in a corner of the roof. Fourré (the porter) stopped the child, saying—‘Ah, young one, tell your father the landlord wants his money. What the devil! Jerome laughs at us!—Because he is ill he thinks we shall forget the rent he owes; but his goods will be sold if he does not pay—tell him that from me.’ The child looked at the porter with a small countenance of mingled fear and shame; then quickly climbed the ladder and disappeared. M. Guerreville, who at first paid no attention to the child, turned as the porter spoke to her; he examined that little face, so pale, so thin; the features so small and delicate, surrounded by curls of bright chestnut hair; and he was surprised at the thoughtful expression of that very young countenance.

“This little girl had neither regular features nor rosy cheeks; it was not one of those fat, puffy cherubs, of whom it is customary to say ‘what a fine child!’ nor one of those perfect heads which painters love to put in their pictures; it was a slight, pale, delicate, serious girl, whom many persons would not have remarked, and others would have thought plain; but who possessed a charm for those who could read the expression of her countenance.”

A parent’s love had consecrated one spot—

“M. Guerreville had followed the porter and penetrated into a miserable room, whose wretched appearance wrung his heart. There was no paper to hide the walls and the beams which formed the ceiling; no curtains to the sloping window that admitted the light; a poor stump bedstead, a table, a few chairs, a little buffet of white wood which had been slightly varnished,—this was all the furniture of the room; but in a corner, a few boards had been fixed up to make a separation, which formed a sort of closet. There was placed a little child’s bed; this bed was of walnut-tree, very clean and bright, surmounted by a rod in form of an arrow, and on it were thrown curtains of green, which could surround the bed of the little girl, and screen her from the light which fell perpendicularly into this gloomy retreat.

* * * * *

“Having opened the door, the little girl went back and seated herself close to the sick man’s bed, whose hand she took within her own; trying to read in his eyes the impression made upon him by this unexpected visit.

“‘Ah, yes—this is money well employed!’ said the porter, taking a pinch of snuff with great importance. ‘To buy dolls and little furniture for this little brat; how can any one be so silly? besides they are not cheap

playthings you buy, but handsome dolls, two francs a-piece.'

"Ah,—but listen to me, Monsieur Fourré; it is because I think nothing too good for my Zinzinette—my little girl—my little angel—and now my little nurse. Ah! I should have liked to buy much handsomer things for her.'

* * * * *

"Without appearing even to hear what the porter was saying, M. Guerreville put his hand on the cheek of the little girl, and while caressing her, said to the Auvergnat, 'Is it your only child?' 'Yes, Sir.' 'And you love her much, do you not?' 'Do I love her!—Oh, she is my little treasure. Poor child! since I have been ill she has taken care of me, relieved my thirst, gone out to fetch bread and every thing I bid her. She is very young—only six and a half, but yet there is in that little head more thought and sense than in many older ones.' M. Guerreville made him no answer, he was again lost in thought, his head sunk upon his breast, and deep grief painted on all his features.

"Is it possible to stint oneself thus for a child?" cried M. Fourré, putting out his head from behind the boards. 'Here are three good mattresses on the bed of this little one, and yet her father lies upon a hard palliasso.'

"If that pleases me, Mr. Porter," said Jerome, impatiently, 'I think I have a right to sleep as I like; and for me, who am neither delicate nor difficult, it does very well; but this little pet, Oh! she *must* be treated tenderly, you see, she is so delicate, so fragile; the least thing would hurt her.'

"Would not one think she was the child of a prince! I love my children, but certainly I could not deprive myself of comforts for them—Ah, well, Sir, you have had time to look at this room, I must go down—if it suits you for 50 francs, you shall have it, and I'll take the beans elsewhere.'

* * * * *

"On concluding these words the Auvergnat drew the little girl to his bed, and embraced her tenderly; 'And I am blamed,' he added, 'for buying her fine dolls.—Oh, but I let the world talk and do as I like, don't I, Zinzinette?'

"The child smiled and said, 'Oh, I take great care of my dolly; she sleeps with me, and I'll make her a frock, for a lady in the house has promised me some very handsome pieces.'

"Yes, yes; you are a good contriver, and everybody in the house loves you, except the porter, who never speaks to you but to say something harsh; but he sha'n't abuse you neither, for I will break my pails over his back.'

M. Guerreville takes his leave of the house, giving all the money he had about him to the child, and goes down stairs, where the porter waited his descent.

"And the hand of the porter was still held out before M. Guerreville, but he, after try-

ing his pockets, where he found nothing, put aside the arm which barred his passage, and quitted the house, saying,—'Ah, I am sorry, but I have nothing about me.' M. Fourré remained an instant stupified with anger; at length he struck his cap with his hand, crying, 'I am robbed, as in a wood; was ever heard such meanness! a well-dressed man dare tell me he has no money.—Fie, it is disgraceful!—Now that man,—after all, I believe he is an informer—a spy.'

M. Guerreville recognizes a former mistress, and the contrast of past memoirs in the two sexes is happily managed—the coldness of man, the ever-active fondness of woman.

"Pardon me, Madam, indeed I feel that I am far from amiable—I respond but ill to your friendship—but you know well I was always rather quick, impetuous. And since you saw me, grief has so embittered my temper, that often for a word, for the least thing, I suffer myself to give way to emotions of anger, of impatience, for which I blush. Ah, my society is no longer agreeable. I am no longer that Edward whom you knew formerly, and time has altered my character even more than my features.' 'Oh! you will always be to me the only man for whom my heart has ever throbbed. I do not think you changed. If you would smile again you would be still the same. You have had troubles,—poor dear friend!—but you did not confide them to me. The last time I met you, four years ago, you may recollect that I perceived a secret grief agitated you; and I then entreated you to confide your sorrows to me, but you rejected my consolation.' 'It is because there are pains which no consolation can soften, and these—I think we ought to keep at the bottom of our heart.'

"But, my God! what has happened to you then that is so cruel? is it reverse of fortune? Oh no, I know you well enough to be certain that such events would be supported by you with philosophy. You are a widower—and the death of your wife must have grieved you deeply, for I know that you loved her much, although you were guilty of numerous infidelities,—but men are privileged to unite love to inconstancy; it is a right they have arrogated to themselves, and which they use largely. In short, you loved your wife tenderly, but I think it is more than ten years since she died, and I have seen you since sad, but not desponding. You had a daughter, a daughter you adored, of whom you spoke to me incessantly. Can anything have happened to your dear Pauline?" At the name of Pauline, the countenance of M. Guerreville changed, a dark cloud covered his brow, his looks sunk to the earth, and he murmured in an agitated voice, 'No, no, nothing has happened to my daughter, but she has not been with me for a long time—she is married.'

"What, your daughter married, and you have consented to part from her?" 'It was necessary, it was for her happiness.'

"Where does she reside now?" "Very far off, in Dauphiné." "And you?" "I am in Paris."

"Have you no longer your fine estate near Orleans?" "Yes, but since my wife died and—my daughter married, I wearied of it; this is the reason why I have travelled for some time—and now I am determined to remain a little while in Paris."

"Oh, how glad I am to hear it. I hope you will come and see us; you will not live like a hermit, you will not fly from society; and your god-daughter, your little Agathe, do you not wish to see, to embrace her? For my part I have often spoken to her of her godfather, poor little thing; it is nearly twelve years since she has seen you. Oh yes, it is quite as long as that since you came to our house. Perhaps she would not know you, but I intend she shall come to-morrow and pay her respects to her godfather. My maid shall bring her to you, for my daughter never goes out alone. Do you permit it, sir?"

"Certainly—and yet—your husband." "Oh, my husband—you well know it is not he who rules the house—except his dinner. Besides, Monsieur Grillon is much attached to you; he will be delighted to see you again. He has often asked me if I had heard from you, and I shall please him much by telling him you are in Paris. Ah, give me your address, for it is still possible you may not come to see us; but at least I will send you my Agathe, I wish you to see how pretty she is; how much she is like her—But, my God! what does this signify to you? Ah, these men, these men! they do not long continue amiable."

"M. Guerreville drew from his pocket a card, on which was his name and address: he presented it to Madame Grillon, who put it into her bag, and pressed his hand, saying, 'Agathe shall go and embrace her godfather. Then, sir, in friendship to this dear child, you will perhaps condescend to come and see us sometimes.'"

"They parted, the lady smiling; M. Guerreville compelling himself to return her smile."

* * * * *

A second scene, somewhat similar, awaits him, as he goes into a shop to buy gloves.

"He enters; a female is sitting alone at the counter. M. Guerreville scarcely looks at the dealer; he asks for gloves, and while they are sought for he sits before the counter."

"The boxes were opened and examined; the dealer appeared quite agitated; she mixed men's with women's gloves, and confused the colours, because she never ceased looking at M. Guerreville, who paid no attention, and had already relapsed into meditation."

"These will perhaps suit you, sir," was at last said in a trembling voice. M. Guerreville put out his hand, but felt it gently

pressed, without any attempt at trying on the gloves; he raised his eyes towards the dealer. Their eyes met.

"Marie!" cried M. Guerreville. "Yes, sir, yes, Marie. You came in then without knowing that this shop belonged to me."

* * * * *

"But have you no other consolation?" Marie raised her head and gazed at M. Guerreville; an expression of joy animated her features, and she cried, "Ah, you have not then forgotten him. I wished to see if you would speak of him—if you still thought of him—that poor child—my idol—my treasure—my son! the — Oh, but my God! tell me at least that you have some affection for him; that you wish to see him—to embrace him—tell me so, sir, that I may know the sweetest pleasure of a mother—that my heart may again leap with joy! Oh yes! yes, you wish to see him: do you not?"

"You may be assured I shall give the preference to this house. Here is my address; say to—to your son, that I am always at home till noon." "Oh, I shall not forget it."

"Adieu Madame"—"Adieu, Monsieur."

"M. Guerreville exchanged another glance with the fair perfumer; he then quitted the shop, and returned home, saying, 'Singular day—these are meetings which I did not expect.—Poor woman!—all this had passed away from my memory.'"

The fair Agatha, his *God-child*, (a denomination adopted, we presume, to show the parent's pious reverence for this gift of heaven) is an accomplished specimen of what we should have been tempted to send, with Cuvier, to its proper class, the boarding-school; but in these times of "Seminaries and Societies" such establishments are but fossil remains. The young lady's biography is given by herself with a clearness of detail that itself speaks volumes for its accuracy. The happy father asks—

"Your parents have doubtless attended to your education?" "Oh! yes, godpapa, certainly I have been well taken care of, but I was removed from the first boarding-school where they put me, because we had hash every day for dinner—I complained to mama, who mentioned to the under-governess that hash made me sick—this lady told the mistress, who said that she should not alter the plans of the house for me—mama thought this answer very impolite, and removed me to another school, where I was much better satisfied—they had on week-days lentils and potatoes with beef—now I do not much like potatoes, but delight in lentils, especially with oil—but if you knew, godpapa, how little oil they put in their salads at boarding-schools—I really think they often put none at all—and that is very bad for the stomach—one of my friends —" "Is it long since you were removed

from school?' 'Oh yes, eighteen months, godpapa, papa and mama thought I knew quite enough—that I need not learn any more'—'What do you know then?' 'Oh, godpapa, I know how to sing a little, I can play on the piano a little, and draw a little.'—'It seems that you know little of every thing.' 'Yes, godpapa, and besides—I dance very well—Oh, I dearly love dancing, mama likewise loves dancing, at the ball we are partners, and mama says we are always taken for sisters,——' "

This lucid narrative, whether satisfactory or not to the father, will be more than satisfactory to our readers. We return to Zizine, who had been taken into a rich family, consisting of a young lady of sixteen and her grandmother, as a sort of living pet-doll for the former, who was attached to her with girlish fondness. Stephanie, however, goes to a ball for the first time and there falls in love; she returns late and goes to bed to dream of her lover:—

"The next day the little Zizine watched till her young protectress waked; the child during their absence had dressed her doll exactly as Stephanie was dressed for the ball; she thought to cause an agreeable surprise to her kind friend, and, seated near the bed, holding her beautiful doll in her lap, she waited in silence till Stephanie should open her eyes. The happy moment at length arrived, the young girl murmured something; Zizine ran to embrace her, then showed her the doll, saying—'Look, see how gay and fine you were yesterday.' Stephanie smiled, but she did not laugh, as she usually did when playing with her little pet: she seemed even to look at the doll with indifference. Stephanie, while dressing, told Zizine all that had happened the night before at the ball; and during the whole day she could talk of nothing else; but when Zizine proposed to play with the doll, Stephanie refused, acknowledging that it would not amuse her; and little Zizine in astonishment exclaimed, but—it amused you so much yesterday! Yes—yesterday—murmured Stephanie, in a meditative tone. For the child, yesterday was but the distance of one day: for the young lady, it was no longer any thing but the vague memory of a former life."

A common sensation is happily, though slightly sketched—

"One day, without any precise cause, M. Guerreville felt himself more low-spirited and melancholy than usual: not feeling courage to go out, his heart oppressed and almost bursting with tears, he remained at home sitting near a table, his head resting on his hand, he questioned himself whence could arise this increased weight of vexation and sorrow. And yet on this day the sky was clear and bright; the sun was not concealed by a single cloud."

The feelings of a mother's long and hidden tenderness, is beautiful, though slight, and given but with a single touch:—

"In pronouncing these words a bitter smile crossed the lips of the fair perfumer, who added, with a sigh—'And doubtless it likewise was a myrtle that this young person offered to M. Guerreville?'

"'Yes, mother, we had each the same shrub; M. Guerreville gave his god-daughter a little pocketbook, and to me these tablets, which are very elegant—see, here they are, dear mother—I have not yet opened them.'

"Marie took the tablets, drew out the pencil which fastened them, and a bank-note fell out and fluttered on the counter. 'A thousand francs,' exclaimed Julius, examining the note; and a bright look of pleasure passed over his features—though he turned directly after to his mother, saying, 'But may I accept so considerable a gift?' 'Yes, my son,' answered Marie, casting down her eyes. 'Yes, for in refusing, you might displease M. Guerreville, and you must be careful to preserve his friendship.'

"Julius then took the bank-note and enclosed it in his tablets, which he seemed never weary of admiring; in a few moments his mother said, in a faltering voice, 'And did M. Guerreville embrace you?' 'No, mother; and I did not dare to embrace him, although I longed to do so.'

"'Not a single caress!' said Marie to herself, turning away to conceal her tears. 'Ah! that would have been more precious than all his money.' "

* * * * *

There is much truth and propriety in the following:—

"'How is it that the offspring of unhallowed love, of intrigue, and mystery, are viewed by us with indifference, while we cherish the children of our marriage, although love has frequently little connection with their birth? Is it that the first remind us of a fault or weakness which we would gladly forget?'

"'No, my dear Guerreville; but it is, I think, because the heart expands only to those who give us the sweet NAME of Father. Yes, my friend, this name which demands from us both love and protection, awakes in our soul the most tender sentiments of nature.' "

The lover of Stephanie, meditating designs against her unsuspecting innocence, contrives to send Zizine out of the house in his cabriolet with his servant. She accidentally returns just in time to her benefactress, and the disappointed young man vents his rage on his servant.

"He is seated in his cabriolet, and his servant, trembling at his side, tries in vain to justify himself:—

"'You are a fool, an idiot,' said Emile; 'I had given you my instructions; you ought

to have detained the little brat by any means whatever, any contrivances. You ought not to have brought her back to Madame Dolbert's for two hours at least—and after just twenty minutes the whelp reappears!’—

“‘Surely, sir, it is not my fault that we met the father of —’

“‘You should not have stopped.’

“‘I must then have crushed this man, who hung at my horse's heels.’

“‘You should have obeyed me before every thing.’

“‘But, sir —’

“‘That's enough; I dismiss you; you are no longer in my service.’

“When he reached home, Emile retired to the most remote apartment, and there abandoned himself again to his passion. He broke and destroyed every thing that fell under his hands. Valuable furniture, splendid vases, a crowd of pretty trifles which are invented to adorn the apartments of the rich, are ground and trampled under the feet of this impetuous man, who had never met with resistance to his inclinations, and who, for the first time, was unable to indulge these. Like a spoiled child, who quarrels with and destroys his playthings when he meets with opposition to his will, Emile avenges himself on every thing round him; for men are but children of a larger growth, especially when they have been spoiled by fortune.

“‘But for the return of this little imp, Stephanie would have been mine,’ said Emile, throwing himself quite exhausted on a sofa; ‘she was mine, this lovely, innocent, and loving girl! how beautiful in her supplication!—And a child has destroyed all my hopes, has placed an obstacle to my happiness—a child—the daughter of a water-bearer—has placed herself in my way!—I, Emile Delaberge;—I, who have wealth to gratify my passions:—I, who since I have been of an age to feel them, have met no resistance in scattering with profusion this gold upon some, and lavishing oaths to others. It is a child that stops me, prevents me from being happy; for what can I do now? Stephanie sees her danger; she will henceforth be on her guard. Cursed Zizine—I hated her already.—Ah! I hate her now still more—if it's possible! Why can I not break her like this glass?’ And the hand of Emile struck forcibly a glass placed on a table near him. The glass broke, but the hand that struck it received a large cut; the blood flowed; Emile paused, blushing for his conduct:—he wrapped the wound in his handkerchief, and looking round him said, ‘How absurd I am! What a mess! Shall I never know how to command myself! I am more than thirty years old, and for these twelve years past how much folly! how many faults! Is it not time to pause.’ Emile remained long absorbed in his reflections; they were not cheerful, for his brow darkened, his eyes became fixed and gloomy, his respiration short and oppressed. Who could have recognized him as the brilliant and splendid,

the admiration of drawing-rooms, and the envy of his associates.”

M. Guerreville of course is the grandfather of Zizine; her mother being the lost Pauline, her father, Emile De la Berge. Driven to despair of Stephanie by other means, he proposes marriage; and M. Guerreville calling to see his grandchild, recognizes the seducer of his daughter just as the parties are going to church. He strikes Emile, fights, and is dangerously wounded; the marriage is broken off. And hence occurs a catastrophe possible only in France. The water-carrier, furious at his patron's disaster, waylays Emile in his daring scheme to steal into the chamber of Stephanie. He offers two cudgels to his antagonist, who, however, is armed; they fight with his pistols, and Emile is killed by Jean.

This mode of vicarious duelling, which in England has of late justly excited so much ridicule and disgust at the attempts made to introduce or restore it, is far from being unusual in France; and as every man there is a gentleman, and has in consequence a right to some other man's life whenever he chooses to take it, and whenever he is desirous of adding to his proper stock of satisfaction, and this without the slightest regard to difference of station, it is not wonderful that the extreme of amenity in common intercourse, is kept up on the one hand by the extreme of strictness on the other. We have known English officers of some standing in the army receive a cartel from a Frenchman in the ranks; and were ourselves once favoured with an offer of being run through the body incontinent by a gentleman in *blouse*, who drove a cart; but, like inglorious Argives, we declined this eminent satisfaction in favour of a prior engagement, to dinner with another friend, resisting the temptation of the second invitation from sincere regard for our readers.

It may be a fair question whether this facility of redress has not been influential on the tone of French society in every class; and whether the rough Englishman, with his promptitude of fist, would not, if admitted to an equal advantage with the Gaul, feel the moral influence of the small sword and the bullet as principles in ethics, without requiring their physical development and operation to set at rest any bilious irregularity of his intestinal functions. A mathematical demonstration of the peculiar properties of these instruments of science would create a lively interest with our popular Institutes, and greatly edify the members by their practical application to any given point in Me-

chanics; the triangle of the one, and the circle of the other, satisfactorily attesting the curious felicity of their selection by our ancestors as the emblems of eternity.

Yet the case is better for them as it is, since evidently, from recent instances, none but a man of a certain rank has a title to "benefit of clergy;" which in such predicaments is exerted, not to save its object's life, but to reproach his safety when the danger is over. Late illustrations of this active care for the spirit in preference over the flesh of the delinquents, whilst they evince that our pastors conscientiously confine themselves to the "cure of souls," in their special vocation, yet have created certain uneasy suspicions in our minds, whether it would not be better for one of the privileged class to take at once his quietus from the evils of this mortal life, than, by persisting in retaining it, subject himself to stand as a quaintain, exposed to the united assaults of those spiritual champions immediately afterwards. "Massa," objected the negro, "if you preachee, preachee; if you floggee, floggee; but no preachee and floggee too." It is hard for a gentleman accustomed to good hours, and who has to rise at six in the morning to fight, if he is to sit up all night to study theology. We are by no means sure that this was the express meaning of the clause admitting to "benefit of clergy," but if so there can be no difficulty in understanding why reading, and writing too, were indispensable for its attainment.

But as it would be better to prevent a crime than to punish it, might not the legislature organize a spiritual "Preventive Service" to this especial end—and divide it into two classes? At present, as a noble marquess insists, a man refusing to fight may be horsewhipped; but he might boldly refuse the first if provided with a proxy for the second, and allowed to name an obliging spiritual friend and pastor, to whom it could do no possible injury. The regular parish clergy have enough to do as it is, but numbers would come forward spontaneously no doubt, for we hear of thirty-six volunteers in one case.

The ordination of the second class should be for the purpose of preventing the sin before it is committed; instead of after, as at present. In this case the charge of *having committed* a crime to-morrow, would be novel and effective. Or if a member of the House of Peers has actually gone out, since he is beyond recall, why not lecture the others instead? We grieve to find that the Commons are not likely to benefit in any shape. Inferior parties, and challengers,

have no need of improvement—they are, ipso facto, exemplary Christians. So also are all persons accepting challenges, from the shepherd David, who killed Goliath in a duel, up to the rank of viscount. Dukes also are exempt by their station, and perhaps their eldest sons. We would recommend the taking out a license for gentlemen going out to shoot their friends, the same as for other wild-brutes and birds.

So hopeful a system we should trust to see soon extended to other sins, which there is no reason should escape any more than this. The little peccadilloes to which flesh is heir, and which, like the former, are strongly recommended by the authority of David,—Why should they be uncultivated? Why should the "Preventive Service" hesitate to denounce the contraband amiabilities of Peer, or Peeress, to their face? Why not lecture the wife for the husband, the husband for the wife meditating such evil doings? Why not approach and save the intended delinquents, in the very crisis of their perdition? When, too, a single lecture would economize the virtues of both, and their own labour.

Why indeed not publicly address such parties even now? provided always the victims be of a rank to give a chance of desired notoriety to the lecturer. Such selections could not be more invidious than the recent. Why not come to face, to point 'Thou art the Man, or the Woman? There is Nathan's example for this at least, though he came a little too late. But our monitorial peripatetics are, we fear, as unlike to Nathan the Prophet as to "Nathan the Wise."

ART. IX.—*Lexique Roman, or Dictionnaire de la Langue des Troubadours, comparée avec les autres Langues de l'Europe Latine.* Par M. Raynouard. Tome Premier. Royal 8vo. Paris, 1838.

On a former occasion we noticed the second volume (the first in order of publication) of this most important work. The volume then reviewed contained the commencement of the Dictionary of the Old Provençal Language, extending through the three first letters of the alphabet; and, considering how little had been hitherto done towards such an undertaking, we feel ourselves justified in saying that it is the most perfect work of the kind ever produced. Nobody can lament

the loss of Raynouard more than ourselves ; but it is some consolation to find that he had left the work of the greater part of his life in such a condition as, by the care of M. Just Paquet, his heir, we may expect ere long to see it complete on our shelves.

The present volume, with the exception of an introductory *résumé* of the Grammar of the Neo-Latin tongues, consists of a large body of ancient Provençal poetry, and contains the most important documents of that language. An idea may be formed of the extent of this collection from the circumstance that one of the poems which it contains, the Romance of Jaufre, printed closely in double columns, consists of upwards of nine thousand lines.

The study of the Provençal language is one of the utmost importance in its bearing upon that of the other modern languages that have sprung out of the wreck of the Latin. It forms, in a peculiar manner, the connecting link between the pure language of Rome and its several descendants. The antiquity of the *form* of a language does not always depend on its position or its date. At the present day, the Spanish is older in form—advances nearer to the original Latin—than the Italian, which we might have supposed to have been the elder by its position. In the thirteenth century, to judge by the documents which remain, the Anglo-Norman language was older in form than the French of the twelfth century, although doubtlessly the latter had preceded it in the date of its formation. And so, to judge by all the monuments which remain, the Provençal, at the earliest period when its monuments are abundant, was much older in form than the Italian, or the Spanish, or the Anglo-Norman, or any other Neo-Latin tongue, and consequently in the stream of derivation it holds the first place after the parent language. It is thus necessary, for the explanation of many anomalies and variations in the others, which would otherwise seem altogether without reason.

The literature, however, of Provence, does not occupy the same position with regard to that of the other people of the middle ages, as does its language. It neither forms a link between the Latin literature, and the French and Anglo-Norman ; nor does it furnish us with the rude model of that which was spread throughout Europe in the thirteenth century. On the contrary, so early as the eleventh century, we find the literature of the south of France exhibiting that gay lightness of character, that chivalrous form of gallantry, shaded off with the richest tints of gothic imagery, that high degree of refinement, which did not appear else-

where till several ages later. It is a literature which, at that remote period, was peculiar in its kind.

Whether we turn to the early literature of France, of Germany, or of England, we find each going through regular gradations. First come the old romances, whose groundwork were still older legends of the purely national traditions—then come, later in relative formation, though often partly contemporary in their form with the preceding, the long, heavy, religious poems, and the saints' legends ; these are followed, more or less immediately according to historical circumstances, by the poetry of a stirring and, in some measure, refined society, when the solemn chivalry of the heroic age, employed in feats of wild warfare, or dreaming in the mead-hall over the memory of deeds which had been perpetrated, and its successor, the period when medieval superstition ruled paramount over all, have both given place to the din and intrigue of political strife. Then, the spirit which has been infused into party song and satire, perpetuates itself in amorous chants, and finds its way into the whole body of the national literature. Every thing is moving and animated. The poet is neither the dependent bard who touched the strings of his harp at the festival, nor the cloistered monk ; but the prince, the partizan, or the courtier.

When we turn, however, to the literature of Provence, we find a singular anomaly. We there fall at once upon the third of these periods, without any traces of the steps which in other countries led to it. In fact the national literature there appears not to have gone through the same gradations. There are no signs of the ages of romances, and religious poems, and metrical chronicles, but from the first we meet with songs and satires in their most refined shape ; they are indeed the only purely original productions in the language. The romances and saints' legends are evidently adventitious, and of a later date : and the only metrical chronicle, that of the war of the Albigenses, by William of Tudela, was apparently produced in adoption of a faction which had long existed in the north. We may also observe that the romances and saints' legends are generally not written in pure Provençal, but in a northern dialect, and are the alteration of works of a still more northern origin to suit that dialect, perhaps in many cases by the scribe who wrote the manuscript in which they occur. So we find the originals of the romances of Fierabras and Gerard of Rousillon, in the same words, allowing for various readings incident to manuscripts, in the northern French of the thirteenth century. And there can

be little doubt, from their subjects, that the other three given by Raynouard once existed in the same form.

In the present volume Raynouard has published, in addition to the extensive collection given in his former *Choix*, a large number of songs, servientes, tençons, &c., by no less than fifty different poets, many of them distinguished warriors and lofty barons, who flourished at different periods from the eleventh century to the fifteenth. If we inquire the reason of this strong characteristic of the literature of Provence, we may perhaps find it explained by the supposition, that the population of the south was in its composition more Roman—that the mixture of northerners was not sufficient to engraft upon it those old traditions, which they carried into other parts,—and that it did not possess in the same way a line of monarchs who prided themselves upon their descent in a direct line from the old fabulous genealogies, which was the cause that no indigeneal romantic cycles existed there; but that the literature of the country sprang up under the political circumstances, which in other countries only produced a change in its character. Be this as it may, the Provençal songs belong to a class of medieval literature, which is

most valuable on account of its intrinsic beauty; they are natural and original, full of life and vigour, and distinguished by a playful variety of rhyme and measure. The saints' legends in every language are dull and uninteresting; the French romances, with a few exceptions, are devoid of taste, trifling, and tiresome; but the songs, which have preserved to us the pure and ancient *langue d'oc*, are always elegant, and pleasing.

Besides the whole or abstracts (with long extracts) of five metrical romances, and the collection of songs just mentioned, the volume, whose title stands at the head of our article, contains an abstract of William of Tudela's Metrical History of the War against the Albigenses (since published entire by M. Farinel), and lengthy extracts from various other poems, such as the *Breviary of Love*, a long philosophical and theological poem; a moral poem, entitled *The Book of Seneca*; the Life of St. Enimia; a poem on the Four Cardinal Virtues; the Lives of St. Trophimus, St. Honoratus, and St. Alexis; and metrical versions of the Apocryphal books of Nicodemus and The Infancy.

MUSIC ABROAD AND AT HOME.

BENGAL.—A gentleman in the H. I. C. Service is employing his leisure in collecting original Indian airs, which he intends publishing with notes on the manners of the ancient poet-musicians. This is a subject teeming with unexplored matter, and will, we hope, attract the attention it deserves. From India we derive the custom of *criers* or heralds, who precede warriors or princes reciting their qualities. "The great Garus never appear in public without the utmost degree of pomp. Several bands of musicians precede them, playing on all the instruments of the country. Some of their officers take the lead, singing odes in their praise. The custom of having criers on such solemnities to make their proclamation of praise before all great personages when

they appear in public, is common throughout all India. They repeat with a loud voice *or sing* the renown of their masters, with a long display of their illustrious birth, exalted rank, unbounded power and high virtues."—See *Dubois' Description of People of India*, p. 68.

MADRID.—The Spaniards laugh at the ideas of painters or travellers, when speaking or delineating Spanish customs, introducing the Fandango and the Bolero; these dances being scarcely known in Spain. They are as much forgotten as the Minuet and Gavotte are in England. The *Domino noir* has been produced, but it has been arranged as a musical comedy by Ventura de la Vega, and bears the title "*La Seganda Dama duende*." Spohr has fallen into two

errors, viz. first, in giving the Bolero as a dance at the king's ball, and secondly, there has been no instance where the doors of the palace have been opened for a masked ball. The "*Riego Hymn*" has become the national anthem since the change in political affairs.

PARIS.—Paer has left an unfinished opera, entitled "*Olind and Sofronie*;" the two first acts are perfected. The new opera by Helevy, entitled "*The Sheriff*," will shortly be produced in this capital. Meyerbeer's "*Hugonots*" has been performed upwards of one hundred nights. The celebrated violoncellist, Batta, will shortly leave Paris on a musical tour through Germany.

NORMANDY.—In order to preserve the memory of their songs, the Normans employed characters called *runstabach*; these are the Runic letters, and to them were joined those which Ethicus had previously invented, and for which St. Jerome had furnished the signs.

(See Chateaubriand's *Sketches*.)

We have been informed by an Amateur, that a MS. is in existence at Rouen containing some of these ancient Norman Melodies, which have never yet been given to the public in a printed form. There are other Musical Curiosities of a similar kind worth the search.

In the Harleian MSS. No. 1717, is a song or canticle, set to music, upon the advantage of the Crusade, by *Benoit*, the Norman Minstrel. It escaped the notice of Dr. Burney and Wharton.

POLAND.—There are no native composers of celebrity in Poland, and but one new opera was produced during the whole of last year. The representations in the chief Theatre during the year were 191, and at the *Teatr Rozmailosci* 211; twenty-two new pieces were produced, principally tragedies. Iaskinski has recently published six volumes of dramatic pieces in Polish; the series will be completed in fifteen volumes, and contain seventy favoured dramas.

GOTHA.—The new Theatre is now completed, and will shortly be opened for operatic performances.

BRUNSWICK.—A Musical Festival was held in this town on the 16th August, the choir comprised upwards of 300 singers. The only novelty produced was a cantate by Liebau of Quedlingburg, which is described as very beautiful and pleasing:

SALZBURG.—Ole Bull gave a brilliant concert on 11th July, the proceeds of which were added to the fund for building a monument to *Mozart*.

SUABIA.—One of the most interesting spectacles took place at Biberach on the 15th July, the day appointed for the cele-

bration of a great singing festival, to which more than 1000 singers were invited. Thirty-four singing clubs from Wirtemberg and Bavaria contributed to this fête, and entered the little town attended by a band of music, and in carriages decorated with flags and flowers. The houses in the town were similarly decorated, and the residences of the poet Wieland, and the composer Knecht, bore emblematical inscriptions. At one o'clock they assembled in the market place, and sang several national airs. The afternoon and evening performances, which would have been equally brilliant, were entirely suspended by most violent storms of rain, thunder and lightning.

PESTH.—Ole Bull lately purchased a very beautiful Cremona violin for 4000 francs (166*l.*); in the inside it bears the following inscription: "*Antonius Stradivarius Cremonensis, faciebat anno 1637.*"

BERLIN.—The Bayaderes have been performing at the principal Theatre with great eclat; and have consequently been the general theme of conversation. At Humboldt's suggestion, they visited professor Bopp, the celebrated oriental scholar, but their corrupted dialect was so totally different from the Sanscrit known by the learned professor, that conversation with them in their own tongue was impossible.

DRESDEN.—The great attraction of the summer has been Signora Ungher; her performances in Donizetti's "*Anna Bolena*," and Bellini's "*Norma*," have excited the greatest admiration and surprise. She has left for Trieste, where she is engaged for the autumn.

VIENNA.—A host of musical talent has visited this capital; at one time there were young Mozart, F. Schubert, and Goethe's uncle Walther von Goethe, who has been engaged in the composition of an opera to be brought out in this town. Taglioni appeared for ten nights. The "*Daughter of the Danube*," was produced for her, but Adams' music was so much complained of, as well as the whole arrangement of the ballet, (particularly the inappropriate dresses) that it was withdrawn for the "*Sylph*," which met with enthusiastic applause. Meyerbeer's "*Hugonots*" has also been produced under the title of "*Die Ghibellinen vor Pisa*," and has been enthusiastically received.

ITALY.—During the present year, eight new operas have already been produced. Of these, five were composed at Naples, two at Venice, and one at Genoa, but only one from this number can be said to have fully succeeded, viz. "*Ciarlatain*" by Cammerano, a new composer. Among the new

prima donnas, the following have been eminently successful: Streponi, Gabussi, Frezzolini, and Boldrini.

MESSINA.—The Prince Brancaforte has erected an immense organ upon a hill in his park near this city, which is supplied with wind by a windmill, and can be distinctly heard two or three miles distant.

GENOA.—The new opera by Pietro Combi, entitled "*Ginevra di Moureale*," was brought forward at the Great Theatre, but, with the exception of two or three pieces, found but little favour.

MILAN.—Miss Kemble has been performing in Donizetti's "*Lucia de Lammermoor*" with great applause. A Mademoiselle Agnes Schebest has made a successful début as Romeo.

NAPLES.—The extreme and unusual heat of the weather, during the spring and summer, has had a considerable effect upon the Theatres throughout Italy; they have been less visited. Rossini is still here, and engaged in writing a new opera for the Theatre S. Carlo, under the title of "*Johann Von Montferrat*." The libretto is by Ludwig Guarniccioli. Paganini is at Nismes; he continues in a very weak state, his voice is scarcely audible.

BOLOGNA.—The chief attractions of the summer have been the two sisters, Manzocchi, Almerinda and Eliza, and Dagnini, the new tenor. Mercadante, the composer, brought forward his opera "*Elena di Feltre*," which found so little favour in Genoa and Naples; here it was received with tumultuous applause. Frezzolini, the prima donna, succeeded in enrapturing the audience, and has since performed with equal success in Donizetti's "*Lucia di Lammermoor*." The celebrated tenor, Antonio Poggi, has been appointed singer to the Emperor of Austria. F. Sampieri the composer has been elected honorary member of the Philharmonic at Florence.

CRETE.—A late traveller mentions a "Sarcophagus at Arva in Crete. Sculptured on it one of the figures is a Bacchante playing on a *Tympanum*, an instrument common to the rites of both Dionysius and Rhea, and said by Euripides to have been an invention of the Corybantes.* It was made of an animal's skin stretched on a hoop like the cymbal; it was unknown to Homer's age, when the usage even of that earlier invention the flute, was confined to the Phrygiary, to whom its discovery is usually assigned, and who are said first to have employed it in the celebration of their mystic rites."—*Pashley's Travels*, vol. ii. p. 3.

This is a much more likely origin of the drum than that given by most of the Musical Historians.

Cretan Dance.—The dance and its accompanying song were commenced. The cyclic chorus exhibited, consisted of six women and as many men, each of whom held the hand of his neighbour. The coryphæus favoured us by singing various poetical effusions as they danced.

It requires no great imaginative power to regard these dances of Cretan youths and maidens, as an image which still preserves some of the chief features of the Gnossian chorus of 3000 years ago. As songs are now sung by the peasants on these occasions, so, in ancient times, there was a *hyporchem* or *ballad*, with which the Cretans more than all other Greeks delighted to accompany their motions in the dance. (See a specimen of the songs.) *Pashley's Travels in Crete*, vol. i. p. 246.

While on the subject of Ancient Musical Instruments, we may mention that Dr. Burney, in his notice of Hebrew music, hazards the assertion that "we have no authentic account of any nation, except the Egyptians, where music had been cultivated so early as the days of David and Solomon; the Greeks at that time having hardly invented their rudest instruments."—Vol. i. p. 255.

But in a notice of Arabian music, (*Foreign Quarterly Review*. No. 39, p. 60,) *Thirty Musical Instruments* are enumerated as invented by them. A late traveller alleges that the *Bagpipe* is unquestionably of Arabic origin. There are several treatises extant upon music by Arabic writers,* much older than the days of Solomon, proving incontestibly that the art, and even the science, was well understood by this extraordinary people.

LONDON.—The period during which the Opera, Covent Garden, and Drury Lane Theatres remain closed, is always an interval devoid of interest. For, as regards this metropolis, if we except the talent which Webster has drawn around him at the Haymarket, we might say the theatrical as well as musical talent were all out of town; but cheering prospects are before us.

Covent Garden has been entirely re-embellished, and the boxes hung with superb draperies. Mr. and Mrs. Charles Mathews, the lessees, have engaged a very talented company, including Farren, Keeley, and

* The work by *Al Farabi*, (called the Arabian Orpheus) treating on the principles of the Art or *Elements of Music*, and the *Kitab al Aguni*, or great Collection of Songs, by *Abulfaraji*, A. D. 1226, are in the Library of the Escorial.

* Priests of Cybell, or Rhea, the wife of Saturn.

many excellent comedians. The theatre opened on the 30th, with Shakspeare's comedy of "*Love's Labour Lost*." A long list of novelties are in active preparation, including a drama by Sheridan Knowles.

Drury Lane has not been behind its rival, either in re-decoration or engagement of talent. Mr. W. J. Hammond has shown great judgment in securing the services of Macready and Ellen Faucit, as well as in engaging James Wallack. The theatre will be opened with a new piece of Douglas Jerrold's on the 16th (October) instant.

The Haymarket continues to draw crowded houses with the "*Lady of Lyons*," and we hear a new play, by Sir Edward Lytton Bulwer, is in course of preparation.

The St. James's Theatre has been taken by Balfe, in conjunction with Mr. Bunn, for the production of musical entertainments; and we have no doubt they will succeed.

The Adelphi opened its doors for the winter season on the 30th, with several attractive pieces.

The Promenade Concerts à la Musard will be shortly resumed at the English Opera House, which has again closed after a very short and unsuccessful career. These concerts will possess all the principal musical talent which so distinguished them last year, when Willy Harper, Negri, Richardson, and Baumann, drew such crowded houses. We are confident they will be rewarded with similar success.

The Sacred Harmonic Society at Exeter Hall will recommence their performances on the 4th instant with "*Judas Maccabeus*." We can cordially recommend this Society as one of the best conducted and well regulated in London; the low price of the admission tickets will always ensure a full attendance.

Society of Female Vocalists.—Her Majesty Queen Victoria has, in the most gracious manner, sent a donation of twenty pounds, in aid of the gradually increasing fund of this praise-worthy association, which, as it includes nearly all the principal female vocalists who have so frequently administered to the gratification of the musical public, deserves, and we trust will receive, abundant assistance from the nobility and wealthy amateurs.

The closing of the concert season enables us to bestow a few words upon the present state of music in England, interesting alike to the singer, composer, and amateur. In the first place, then, what is the patronage to be expected by the cultivated English musician, be he singer, composer, or performer? Royalty affords *none*. The nobility and gentry (with the exception of Earl Grosve-

nor and one or two other families of distinction) *none*. The mania is for every thing foreign. Although we have the works of Purcell, Arne, Shield, Percy, Dibdin, Bishop, Callcott, Barnett, &c. &c., long the boast of musicians, as men who adorned by their works the country of their birth—*where*, this season, have any of them been heard?—Echo answers, *Where?*

Although we have at this moment as much talent in England as there is existing on the continent, with this only difference—with them all the diamonds are polished and becomingly set, eagerly sought after, and appreciated; with us, "*many a gem of purest ray serene*" finds no lapidary to polish its roughness, make the most of its brilliancy, or introduce it as a *jewele of worthe* to those who could estimate its value. While this is the case, and foreigners alone are patronized by the higher classes, real English music must sink (but most undeservedly) in public estimation.

"As music, which, I apprehend, had the precedence of poetry as a human invention, was regulated by certain principles of art, when words came to be adapted, these latter would of course be likewise regulated by similar principles. The measured cadences, therefore, of musical expression may be presumed to have first suggested the idea of metrical harmony, and to have evolved the elements out of which every order of verse subsequently derived its existence. But Poetry, as it improved and ripened towards maturity, rose above the trammels in which Music had originally shackled it; and becoming disassociated from its parent art, sprang up and ramified into an almost endless variety of production, leaving all other mental processes at an immeasurable distance behind it, and becoming a universal agent of the purest mental enjoyment."

This extract is from a work lately published, entitled, "*The Poetry of the Pentateuch, by the Rev. Hobart Caunter, B. D.*," which treats of the beauty and sublimity of the poetry of the five books of Moses. It well deserves a place in the library of all who have yet to learn where to search for the highest class of poetical inspiration. The observations upon primeval music, interspersed among the first two or three chapters, evince the reverend author's appreciation of, and power over the subject, and will very greatly interest the educated musician, who observes his art, in the only way it ought ever to be viewed—with a poetical eye.

Reminiscences of Handel; The Duke of Chandos, Powell, and the Harmonious Blacksmith. By Richard Clark, fol. London 1836—"Allen, Michael Angelo, and Han-

del belong to the same order of minds ; the same imaginative powers, the same sensibility, are only operating with different materials."—This brief tribute to the gigantic composer by a well-known writer, (D'Israeli,) sums up in few words the causes that occasioned such extraordinary effects in the musical productions of this child of genius. Every particular, however apparently trivial, in the life of Handel, must continue to interest musicians, and we therefore have to thank Mr. Clark for his acceptable contribution ; which, with his usual enthusiasm in such matters, he has printed at his own expense, for private circulation among his friends. Respecting the origin of the air in Handel's lessons, known by the name of "*The Harmonious Blacksmith*," when the composer was at Cannons, (the seat of the Duke of Chandos,) near Edgware, he was one day overtaken by a heavy shower of rain, from which he took shelter in a blacksmith's shop by the road side.* The industrious occupant was beating iron on the anvil, and singing at his work. The varying sounds of the hammer falling on the metal, mingling with the rude tones of the man's voice, suggested to Handel the feeling and character of this melody, a simple speaking air, replete

With image, music, sentiment, and thought,
Never to die.

There is a clever lithographic engraving of Whitchurch, (Cannons,) where Handel presided at the organ, and a copy of the composer's will. While on this subject, we may remark that there is no well-written and popular life of the immortal composer to be had. The *memoirs* of Smith, his amanuensis, 8vo. 1760, are rather scarce ; but from these, Hawkins, Burney, Archdeacon Coxe, *Life of Handel*, and one or two other sources, easily attainable, a cheap and condensed memoir might be made, including the opinions of various writers upon his works, that would form a pleasing volume for the young-

* This shed has been, for some years past, the abattoir of a *butcher* ! "To what base *uses* may we not return, Horatio !"

er students. The following anecdote may, perhaps, not be so generally known.

While Marylebone Gardens were flourishing, about the year 1738, the enchanting music of Handel, and probably of Arne, was often heard from the orchestra there. One evening, as my grandfather and Handel were walking together, a new piece was struck up by the band. "Gome, Mr. Vontaine," said Handel, "let us zit down and listen to this biece ; I want to know your opinion of it." Down they sat ; and after some time the old parson, turning to his companion, said, "It is not worth listening to—it's very poor stuff." "You are righd, Mr. Vontaine, it is very boor stuff—I thoughtd zo myzelf when I vinished it." The old gentleman being taken by surprise, was beginning to apologise ; but Handel assured him there was no necessity : that the music was really bad, having been *composed hastily*, and his time for the production limited ; and that the opinion was as correct as it was honest.—See *Letter from Norrison Scatcherd*, p. 502. in Hone's *Year Book*.

Belshazzar's Feast, an oratorio, by J. H. Griesbach.—This subject has been set by Handel, but, as a whole, it was never so successful as some of his other works. Mr. Griesbach is a sound and tried musician, and has shown his zeal in the good cause, by venturing to print, at such a time as this, a musical work of the highest class. The story is treated in a dramatic and elaborate manner by Mr. W. Ball, (the author of the words,) and in some pieces, such as the tenor song, "*Raise the Song of Festal Pleasure*," and the quartett, "*Fateful Hour*," he has displayed a capacity of adapting words to music, not usual in the general style of poetical adaptations. There are forty-five pieces in this oratorio ; in performance some of the recitations would require curtailing. The solos and chorusses are very effective and well wrought, and the finale is splendid. Altogether, we have no hesitation in saying, that this oratorio, when well performed, would place Mr. Griesbach's name among the first of our native composers.

MISCELLANEOUS LITERARY NOTICES.

FRANCE.

PARIS.—The most comprehensive history of Portugal in the French language has recently been published. It is entitled "*Essai sur l'Histoire du Portugal depuis la Fondation de la Monarchie jusqu'à la Mort de D. Pédre IV.; 1080 to 1834.*" The authors are M. Chaumeil de Stella and M. Sauteul. The work is embellished with portraits of Don Pedro and Donna Maria the Second. A new magazine for the ladies has also appeared, entitled "*Les Voilettes.*" A new work on the history of Poland has been published by the Librairie Polonaise; "*Skarbiec Historii Polskiej, przez Karola Sienkiewicza.*" The first part contains a review of Contareni's *Travels through Poland, 1474*; *Memoirs of the Abbé Kitowicz, 1754 to 1785*, and the diplomatic relations between France and Poland during the thirty years' war; *Memoirs of Count Pozzo di Borgo, 1814*; and remarks respecting the Polish historian, Adam Naruscewicz.

Charles Forster, who has written much respecting Poland, has translated Falkenstein's well-known work upon Kosciuszko, under the title "*Kosciuszko dans sa Vie politique et intime:*" it is accompanied with notes, and a portrait of Kosciuszko.

Dr. Larrey has communicated to the Academy of Sciences at Paris a successful mode, adopted by the Egyptians, of preventing any disfigurement from scars by the small-pox. The patient, from the first outbreak of the fever until the height has passed, has the face covered morning and evening with gold leaf, which is applied with a little gum water, and remains perfectly fast and smooth, even during the period the pock is confluent and the face swollen; except in one or two small places, where the pillow may accidentally rub the gold off: and it has also the additional quality of allaying the irritation which usually accompanies this distressing malady.

GERMANY.

HANOVER.—We hear that the Fifth Volume of Pertz's *Monumenta Germaniae Historica* will shortly leave the press. The Fourth Volume was published in the autumn of 1837. The Third Volume of Ruperti's Tacitus is at last announced as ready, and will complete this excellent work. The First Volume of a new edition of Döring's Horace has been published by the brothers Hahn, of this city. It is re-edited by Gustavus Regel—a name new in classical literature; he is, we think, a professor at Göttingen. The same publishers have just brought out the Third Volume of Schubert and Walz.

BERLIN.—M. Leipmann (of Berlin) has invented a machine for copying paintings in oil with perfect exactness. The invention is stated to be the result of ten years' incessant study: during which time the ingenious artist suffered the severest privations, and supported himself by making sealing-wax at night, the day being wholly devoted to prosecuting the above discovery. M. Leipmann is said to have been a regular attendant of the museum at Berlin, and to have selected a portrait by Rembrandt as the object of his experiment. Fixing single features and parts of this picture in his memory, by hours of daily and incessant observation, he contrived to reproduce them at home, with perfect fidelity, and by the aid of a machine—in what manner is not known. The discovery, however, is so complete, that he lately produced, in presence of the directors of the Museum, 110 copies of the painting in question. These copies are said to be perfect, and to retain the most delicate shades of the original picture, confessedly one of the most difficult in existence to imitate in the usual way. The price of the copies is but a louis d'or each.

We trust that this admirable discovery will not meet the fate of a perhaps some-

what similar invention, by a Flemish artist, about fifty years since, and whose imitations, then exhibited at the Adelphi, in London, were such perfect facsimiles as to defy the most skilful connoisseurs to distinguish from the original paintings. It was considered, however, at the time, that the merit of the imitations destroyed the value of the originals themselves. The invention was discouraged, and the artist, quitting the country, died abroad in great distress.

BRANDENBURG.—Great preparations are making for the celebration of the third centenary of the Reformation for the 1st of November.

DRESDEN.—The celebration of the third centenary of the Protestant Reformation, which commenced in Dresden on 5th July, 1539, was held on a scale of splendour never before witnessed in this town. The morning of the 5th July was ushered with the ringing of bells and firing of cannon. A procession walked from the town hall to the Kreuz Church, which was decorated with flowers and orange trees, and were favoured with a sermon appropriate to the occasion. On the following day they attended at Neuestädler Church, when Haydn's Creation was given with all the talent and celebrated singers of this and the neighbouring towns, including Mdle. Schroeder Devrient. In the evening the city was brilliantly illuminated, and innumerable transparencies and inscriptions, relating to Luther's worth and honour, were to be seen in every part of the city. But the most imposing spectacle was the Frauen Church, which was illuminated with large lanthorns to the highest point of the tower. The Roman Catholics took a friendly part at this celebration, and expressed the utmost goodwill; even the most bigoted refrained on this happy occasion from any expression of illiberality.

Prince John, Duke of Saxony, has just published, under the assumed name of Philalethes, the first part of an improved and enlarged quarto edition of "Dante, Alighieri's göttliche comödie," in metre, with critical and historical notes. The title plate is by Moritz Retzsch. It has also a map and two plans of Hell.

BONN.—Professor Redepenig has left this town for Göttingen, to supply the place of Ewald, Weber, and Ruperti, as professor and chaplain to the University. The last new oriental work published here is Parisini's Grammatical Aphorisms, with the Sanskrit notes. It is, however, still very difficult to read, and the appearance of Dr. Böhtlingk's Commentary, which will form the Second Volume, will be hailed with pleasure by the Sanskrit student. Delius is writing a book on the Sanskrit Radices; and Westrogard, who is at present in Paris, has a work on the Pracrit Radices.

STUTTGART. Cotta has republished Kotzebue's "Geschichte für meine Söhne," which will in some way supply the great

want of proper reading books for the male youth of a more advanced age. The edition of Voss's *Odyssea*, lately published at Leipsic, has induced the same publisher to bring out a cheap pocket edition of the *Iliad* and *Odyssey*; but this is a second translation of Voss's, and not considered to be so good as the first.

Ludwig Schöner, the editor of the *Kunst-Blatt*, has published the Second Volume of his translation of Vasari's *Lives of the Painters, Sculptors and Architects*, from Cimabue to the year 1567. It is embellished with many plates, and has a great quantity of original matter not found in the Italian.

The last number of the German Quarterly Journal contains several interesting articles. One on the Machinery in modern Manufactories; a paper on National Education, by Bülan, the present editor of the *Jahrbücher für Politik*; another on the Connection of the Manners and Customs of the East with their Religion; also a long article on the popular Belief in Ghosts, &c. in Germany.

The annual meeting of the Association of German Naturalists and Physicians was held this year at Pymont, in September. The following were the sections:—1, Physic and Astronomy; 2, Chemistry and Pharmacy; 3, Mineralogy and Geology; 4, Botany; 5, Zoology, with Anatomy and Physiology; 6, Medicine and Surgery.—Excursions were made to the celebrated mineral springs in the neighbourhood. Foreigners are admitted members, and the dinner, which was provided in the great hall, was contracted at half a dollar for each member daily.

The Apothecaries' Association for Northern Germany will also hold their annual meeting at Pymont very shortly.

One of the peculiarities of the middle ages was the marrying their princesses at a very early age. It was customary to give them in marriage on their attaining the age of twelve; for we find Otto, the second duke of Meran, married Blanca, a countess of Champagne, in 1225, at the age of twelve: he had just completed his fourteenth year. Hedwig, daughter of the Duke of Maran, was married, in her twelfth year, to Henry, Duke of Breslau, in 1186. Godila, countess of Saxony, had a son, Werinhar, when she was but thirteen years of age.

Railroads.—The line from Leipzig to Dresden is now completed, and has been opened the whole distance. The line between Mayence and Wiesbaden is proceeding rapidly; more than two-thirds of the distance is finished. The same may be remarked respecting the line between Frankfort and Hattersheim, but from Hattersheim to Cassel they are proceeding but slowly. The line from Frankfort is now opened as far as Höchst; but the continuation from thence to Cassel will not be completed before the next spring. The railroad from Berlin to Potsdam has also been re-

cently completed, and has created unusual bustle in the latter town: the journey now occupies three-quarters of an hour, whereas by the old road system it required nearly a day to pass from Berlin to the royal palace and gardens at Potsdam. The Berliner now takes his coffee in Potsdam, after completing his business in the capital, and is enabled to return there again before dark.

The number of Passengers by the great Belgium railroad during the month of August, amounted to 206,435, and the receipts were during the same period 521,287 francs, or 20,850*l*.

GREECE.

There are several newspapers published at Athens, but their only peculiarity is the violent expression of their political feelings. The *Athene* has the largest circulation, amounting to 700 copies, to subscribers. It is the organ of the constitutionalists or English party. The *Æon* is in the pay of Russia, and circulates 500 copies; it is unfavourable to the existing government. The *Tachydrom* is the French organ, and also that of the government. The *Sokrates* is constitutional, and has 600 subscribers. There is also a medical gazette published at Athens, called the *Asklepios*, and a periodical similar to the *Revue Universelle Pittoresque*.

In Athens there are but four booksellers, three of whom are German.

ITALY.

ROME.—The King of Bavaria has purchased several Egyptian bronze vases and gold ornaments, from the celebrated collection of Ferlina.

The high altar of the church of *St. Maria della pace* has been burnt down; but the celebrated al fresco painting by Raphael was fortunately preserved.

Tuskulanum, a small town in Lombardy, possesses several paper mills. In one of them a fine paper is manufactured, upon which the writing, with the common black ink, turns a bright red within twenty-four hours after use, and cannot be erased. The paper is of a very strong and durable character.

POLAND.

WARSAW.—Literature continues to be on the decline; a few agricultural works, and two or three annuals, are the only writings which now appear. The four daily journals, the '*Gazeta Warszawska*,' the '*Gazeta codzienna*,' the '*Korrespondent*,' and the '*Gazeta poranna*' (morning newspaper), are principally used as a vehicle for advertisements; and as politics are very cautiously introduced, they generally fill up what is left, after the daily news and of-

ficial notices, with tales and anecdotes. The '*Gazeta Warszawska*' is accompanied by a leaf called '*Tecza*,' (the Rainbow), in which whole novels appear translated from the French and German.

In addition to these there are ten small journals, most of which have their particular circle; thus the '*Sylwan*' is agricultural, the '*Pamiętnik towarzystwa lekarskiego*,' is medical, the '*Pielgrzym*' is musical. The '*Muzeum domowe*' and the '*Magazyn Powszechny*' treat on common subjects, and are embellished with wood cuts, treating occasionally of the latest literary productions.

The '*Kosmorama Europy*' contains a '*Podroz malownicza*,' illustrated travels, this year on New Columbia, '*Nowy Kolumb*,' with engravings by English artists, and lithographic views.

There is also a '*Magazyn mod*,' Magazine of Fashion, and a theatrical newspaper, entitled '*Świat dramatyczny*,' with portraits of the principal actors at the Warsaw theatres, by Oleszczynski.

The annuals published this year are the '*Pierwiosnek*' and the '*Niezapominajki*,' (the Forget-me-not), published by K. Korwel.

The '*Encyclopedia powszechna*' proceeds but slowly; letter A only is completed.

The only works of great interest of the present day are the '*Numizmatyka Krajowa*' (National Numismatics), by K. Władysław Steżynski Bandtkie, now in the press; it will consist of two volumes, and contains drawings of 1000 Polish coins. The other is entitled '*Pamiętniki o dziejach, pismnictwie i prawodawstwie słowian aż do wieku XIV.*,' by Professor Maciejowski, and will be divided into Two Parts.

Within the last few months Polish literature has lost three of its brightest ornaments: Anselm Szwejkowski, president of the Warsaw University; Joseph Mrozinski, author of a celebrated Polish grammar; and Professor Ludwig Osinski, celebrated for his translations of Corneille's Tragedies, and his Lyrical Poems.

PORTUGAL.

There is no country in Europe in which literature has declined so rapidly within the last few years as in Portugal; even Poland, fettered with every restraint, presents us occasionally with works of great literary value. The freedom of the press in Portugal, and with it the unbridled expression of politics, have as yet had an effect contrary to all expectation; thus literature, instead of being encouraged, has suffered incalculable injury. For although there are more than twenty Portuguese newspapers and daily journals, we find them entirely engrossed with political and extraneous matters.

It is not to be denied that the early Portuguese were more studious and learned than those of the present day, and yet until with-

in the last twenty years it was exceedingly difficult to publish any work however useful. The author was obliged to obtain the permission of the Santo Officio, where the manuscript underwent the most rigid criticism. It was then attested that the work contained nothing contrary to the laws of religion; and ere these forms were completed, years would frequently intervene; to these evils followed the slow progress of printing.

It is evident that Portugal possesses no MSS. of an earlier period than the 9th century, although the author of the Catalogue of Alcobaca (in the 5th vol. of the Memoirs of the Academy of Lisbon) states the MSS. numbered 17 to be the work of the 6th century; in this he was in error.

In the library of the convent of Necessidades are two Bibles of the 10th century. Among the archives of Torre de Tombo are several MS. writings of the 12th century of great value; Alcobaca possess 72 MS. writings of the same period, among others are the Geographical Dictionary of Monk Bartholomeo, the Latin Dictionary of Alphons de Louriçal, and the Confessiones S. Augustini, written by Father Theotónio de Condeixa, all of which are but little known.

In the above-mentioned archives, a MS. of the 14th century contains drawings of all the cities and fortifications in the country; there are also of the same period documents of great historical and geographical interest.

The Dante of the public library of Lisbon is very beautiful. The Talmud MSS. are covered with gold, precious stones, and miniatures. The MS. of Aristotle's Ethics, translated into Spanish by Charles Prince of Navarre, and the costly Bible presented by King Emanuel to the monks of St. Cajetan, are also preserved at the public library of Lisbon, and are but little known.

The following comprise the most choice and valuable works of the early Portuguese writers:

HISTORY.]—Fernaõ Lope, the father of Portuguese history. Froissart wrote the Chronicles of King Pedro I., Fernando, and John I. The chronicles of the two first are contained in the Ineditos of the Academy. Azurara, Tomada de Ceuta, (The Conquest of Ceuta.) Ruy de Pina, Chronicles of the Kings, from D. Sancho I. until D. Diniz (Dionys the Just): also the Chronicles of John II. which appeared in the Ineditos of the Academy. Galvao, Chronicles of King Affonso Henrique. Damiao de Goes, Chronicles of Prince Don Joao, and King D. Manoel the Great. Andrada, Chronicles of John III. Osorius, De rebus gestis Emanuelis. Leao, Chronicas dos Reis de Portugal, part 1, (Lisbon, 1600); part 2, published by D. Rodrigo de Cunha. Brito, Monarchia Lusitana, parts 1 & 2; parts 3 & 4 by F. Antonio Brandao,—(these two parts are considered to be the best that has been written upon Portuguese history); parts

5 & 6 by F. Francisco Brandao; part 7 by F. Rafael de Jesus; part 8 by Manoel dos Santos. Menezes, Portugal restaurado. Garcia de Resende, Cronica de D. Joao II. D. Francisco Manoel, Epanaphoras. Barros, Decadas da Historia da India, continued by Diego de Couto; Barros wrote a Portuguese grammar and other works. Castanheda, Historia da India. F. Bernardino de Brito, Monarchia Lusitana, also Elogios dos Reis. F. Luiz de Sousa, Historia do S. Domingos; Vida de D. Fr. Bartolomeo das Martyres; Vida do beato Suro; (Sousa is considered by all critics to be the best Portuguese prose writer). Feire de Andraha, Vida de D. Joao de Castro. Afonso de Albuquerque, Commentarios. Pinto Pereira, Historia da India, during the government of D. Luiz de Ataide. Mendonea, Jornada de Africa. Lucena, Vida de S. Francisco Xavier.

RELIGIOUS WRITINGS.]—Paiva d'Andrada, and Ant. Vieira, Sermoes. Ceita, Quadragenas.

TRAVELS.]—Cartas das Missoes, (being a continuous line of information during the 16th and 17th centuries; it is highly interesting). F. Pantaleao de Aveiro, Itinerario da Terra Sancta. Santos, Historia da Ethiopia. Bermudez, Relacao da Ethiopia. Mendes Pinto, Perigrinações. Gouvea, Jornada do Arubispode Goa, and Relacao da Persia. Godinho, Relacao do novo caminho, &c. Guerreiro, Relações das Missoes, a continuation of the Cartas das Missoes.

POETRY.]—The Cancioneiro, in the Collegio dos Nobres, contains poems of the 12th and 13th centuries; the Cancioneiro de Rezende (Lisbon, 1516,) contains the poetry of the 14th and 15th centuries. Diego Bernardes, his works, collected under the title, O Lyma; Fernao Alvares do Oriente, Lusitana transformada, pastoral songs. Rodriquez Lobo, O Pastor peregrino; A Primavera; O Desenganado; he has also written elegies, odes, and sonnets. De Castro, Ulyssea, an epic poem. Francisco de Sã y Menesez, Malacca conquistada; this and the Ulyssea are esteemed by the Portuguese as the best. Jeronymo Cortereal, Naufragio de Sepulveda, and Cerco di Diu. Brandao, Elegiada.

Camoens, Antonio Diniz da Cruz, Bocage, Dias Gomes, and Francisco Manoel, were the most distinguished poets prior to the 19th century.

THE DRAMA.]—Gil Vicente, the creator of the Portuguese stage, 1480 to 1557, wrote many pieces, the first in 1502. Jorge Ferreira de Vasconcellos wrote three plays, Ulissipo, Aulegrafia, and Enfronino. Antonio Ferreira, two comedies, O Cioso and Bristo, and the tragedy of Ignez de Castro. Sã de Miranda, the two comedies Villalpandios and Estrangeiros. Camoens, Filodemo, Amfitrioens Selluco. Antonio José, (the Jew burnt in 1745,) comic operas. P. Ant. Correa Garcao, O Novo Theatro, and Assembleia.

ANTIQUITIES AND STATISTICS.—Leao, Descripção de Portugal; also Origem da Lingoa Portuguesa; De vera Regum Portugalie Genealogia; Orthographia da Lingoa Portuguesa; Collecção de leis extravagantes Severim; Noticias de Portugal, and Varios discursos politicos. Paiva d' Andrada, Exame de Antiquidades. Mendes de Vasconcellos, Do sitio de Lisboa. Oliveira, Grandezas de Lisboa. Marinho d' Azevedo, Antiquidades de Lisboa. Andre de Rezende, Antiquidades de Evora.

RUSSIA.

ST. PETERSBURGH.—Smirdin, the principal publisher in this capital, has recently issued the first volume of a talented work on Russian literature. It is entitled *Sto Ruskikh Literatoror*. The principal papers are by Senkowsky, Davidov, Marlinsky, Zotov, Kukolink, Svinin, and Prince Shakovsky.

Tschernezow, the academician, has recently returned from his travels along the banks of the Volga. He has brought with him more than 100 views and plans, with which the Emperor has expressed the highest satisfaction, and has directed the publication of them, with the voluminous descriptions with which they are accompanied.

Hitherto the title of "citizen of the first class" could not be held by the Jews in Russia. The emperor has just issued an order to the minister of the interior, by which this title may be held by any Jew who renders himself worthy of it by personal merit, or by any eminent service rendered to the state either in art, science, manufacture, trade, or otherwise.

REBUILDING OF THE KREMLIN AT MOSCOW.—It is built in the old style of Russo-Tartar architecture. Upon the roof there is to be a terem or large pavilion, in the form of a tent, such as was found in all the places of residence of the ancient czars, and in which they shut up their women. The interior of the palace will correspond with the exterior, as the disposition of the apartments, their form, ornaments, tapestry, and furniture, even to the most minute details, are to be in the Russo-Tartar style.

The population of Russia, on the 1st of January, 1839, exceeded 60,000,000 inhabitants. The Caucasian and Trans-Caucasian provinces are not included in this amount.

We also find extraordinary instances of longevity; there being at the time in the Russian dominions—

853 persons of from 100 to 105	
125 110 . 115	
130 116 . 120	
111 121 . 125	
3 126 . 130	
5 131 to 140	
1 145	
3 150 to 155	
1 160	
1 165	

During the year 1838—893 works were printed in Russia: of these 777 were original works, and 116 were translations. In the year 1837—866 works were printed: 740 were original, and 126 translations. To these 51 periodical writings are to be added, —making the total of the last year 944 works. The number of volumes imported into Russia during the past year amounted to 400,000 volumes.

WALLACHIA.—A company of young ladies at Jassy have undertaken to translate the best classical works of foreign tongues into Moldavian. Some of these are already published. Prince Stourdza, the Hospodan, who has widely patronised literature, has awarded gold and silver medals to some of the fair labourers.

SWEDEN.

The first number of a quarterly Review has been published at Carlstab. It is entitled *Läsning i blandade Amnen*, and is published under the auspices of the young Count Adlesparre, a son of the well-known promoter of the Revolution of 1809. It has already created a great sensation, particularly an article by Tegner on "the Effects of the Revolution on the Swedish People." Among the contributors are Bishops Franzen and Agardh, and Miss Brehmer, the talented authoress of "*Teckningar ur Hvardagslifvel*."

Miss Linne, the daughter of the celebrated naturalist, died at Upsal, on 23d March, at the advanced age of ninety-one, and was buried with great pomp on the 5th of April. The leading members of the University attended her funeral.

The population of Sweden has been recently found to consist of 3,025,140 souls, showing an increase of one-fifth since the ascension of the present sovereign.

An edition of the Swedish poets has been issued by the talented P. D. A. Atterbom, entitled *Dikter i Prosa*. The second volume, containing four miniature novels, has just appeared, and commences with an excellent prologue to "*Phosphoros*," one of the finest poems in the collection. The first two volumes have been published at Upsal.

This learned professor, Atterbom, has contributed several papers to a new literary journal, the "*Mimer, månadsskrift för Vitterhet, Historia philosophi och Statskunskap*," which appears monthly at Upsal. His article in the January number is on the History of Philosophy; in the February part, on the Ancient Traditions (the Mosaic). There are several interesting articles in the March and April numbers.

TURKEY.

The well-known prejudice against pictures has not altogether prevented a taste for this delightful art in the natives. Capt. Ibrahim Effendi, one of the young Turkish officers sent to England for improvement, has at-

tained a high proficiency in this art, and to which we are happy to bear testimony. The portraits executed by him in oil possess considerable merit; his water-colour drawings approach the effect of paintings, and the style and finish of his miniatures is not easily equalled even here. Though but an amateur, we think this gentleman, who speaks English with great facility and astonishingly well, is destined to lead the way to his countrymen in taste and the fine arts.

EGYPT.

Achmed Pacha, governor of Senaar, is about to send an expedition along the White River.

M. Main, a Frenchman at Alexandria, asserts that Pompey's Pillar and Cleopatra's Needle are only cement.

MISCELLANEOUS.

Frank Hall Standish, Esq., the talented author of "The Shores of the Mediterranean," "The Northern Capitals of Europe," &c. &c., has a work of great interest in the press, entitled *Seville and its Environs*, which will be embellished with a portrait of the author.

The lovers of science will derive great gratification from the perusal of the "Outlines of Analogical Philosophy," by George Field, Esq. The work is interspersed with many well-executed diagrams, and is very skilfully divided into sectional divisions, which form a ready reference to the philosophic reader.

An interesting "Essay on the Literature and Learning of the Anglo-Saxons," by Thomas Wright, Esq., has recently appeared, and attracted continental attention.

A selection from Jean Paul F. Richter's beautiful writings have been very carefully translated by A. Kenney Esq., of Dresden, and published in London under the title of "Death of an Angel, and other pieces." They are accompanied with a sketch of Richter's life and character.

A clever little volume of German, French

and English Conversations is now in the press. It is on an entirely new plan, and preceded by a philosophical introduction to the study of European and Oriental Languages.

The want of a good Guide Book for the south-eastern part of Europe has long been complained of, and we hail the appearance of Mr. R. T. Claridge's "Guide down the Danube" with great pleasure: still we think the title might have been more comprehensive in the extent of the first few words; it is in fact a Guide to Southern Europe, for the author has traced out the routes to Smyrna, Greece, the Ionian Islands, the route to India by way of Egypt, and from Paris to Marseilles. It will form a valuable addition to the list of hand books.

Another work, highly interesting to the summer tourist, bearing the title "Legends of the Rhine," has just been published. It contains all the traditional lore connected with the castellated ruins, and little villages which ornament the banks of this picturesque river; the materials have been very carefully collected by J. Snowe Esq., and sent forth in two handsome volumes, embellished with wood-cuts, and some well executed engravings on zinc. It is to be regretted this work was not completed earlier in the season.

AVA.—A tremendous earthquake occurred at Amcrapoara between two and three o'clock on the morning of the 23d March, and extended with equal violence northward as far as Toungnov, and south to Prome. Pagodas, monasteries, brick dwelling-houses, all within the city and on the neighbouring hills, were destroyed, and from 2 to 300 lives lost; but the slightly built wooden houses escaped. The current of the Irrawaddi was forced upwards for some time; large fissures in the ground, from 10 to 15 feet, formed deluges of water, and threw up grey earth in great quantities, and with a sulphureous smell. The towns and villages near the capital are in ruins, and the old city of Ava is said to be destroyed.

LIST OF THE PRINCIPAL NEW WORKS

PUBLISHED ON THE CONTINENT.

FROM JULY TO SEPTEMBER, 1839, INCLUSIVE.

THEOLOGY AND ECCLESIASTICAL LITERATURE.

Abelly, *Medulla Theologica ex sacris scripturis conciliorum pontificumque decretis et sanctorum patrum ac doctorum placitis expressa*. 2 Parts. 8vo. 10s.
